Entirely Chemical. CANARY GUANO *Always Uniform.*

THE BEST FERTILIZER IN THE WORLD. USED IN EVERY CONTINENT.

From Mr. G. Wythes, Head Gardener to the Duke of Northumberland, Syon Gardens, Brentford.
I am much pleased with Canary Guano. I have found our lawns dressed with it have greatly benefited. It is most valuable for pot plants under glass. It is soon taken hold of by the roots and is a safe plant food.

Guaranteed Analysis with every Tin and Bag.

Sold by Seedsmen, &c., in 6d., 1/-, and 2/6 Tins. Bags, 14-lbs, 4/6; 28-lbs, 7/6; 56-lbs, 12/6; 1-cwt 20/- each, or sent direct from Ipswich, carriage paid in United Kingdom, for cash with order. (6d. Tins 10d., 1/- Tins 1/3.)

Canary Guano is essential to secure perfection in Flower, Fruit and Foliage.

Write for pamphlet with particulars of 37 different Fertilizers, sent free and post paid, to the Sole Manufacturers,

THE CHEMICAL UNION, LIMITED, IPSWICH.

Printed and Published by W. H. & L. Collingridge, City Press, 148 & 149, Aldersgate St., London, E.C., and sold by all Newsagents, and at all Railway Bookstalls.

Aster "St. Egwin"

This most beautiful Starwort or Michaelmas Daisy is of my own raising. It was grown at Wisley by the Royal Horticultural Society during their Aster trials (1906-7,) and was given an

AWARD OF MERIT

on September 26th, 1907. The flowers are large and of a most beautiful shade of pale pink, and the habit, as will be seen from the photo (taken Oct. 1st) is perfect. It is quite hardy, and should be in all gardens.

Strong Roots, 1/3 each; 10/6 doz.
Carriage Paid.

My Price List of hardy Plants, "A Garden ever in Bloom," will be sent post free to all mentioning "Gardeners' Magazine,"

LARGEST IMPORTERS AND GROWERS OF ORCHIDS IN THE WORLD.

WHEELER'S
CHOICE
FLOWER SEEDS.

WHEELER'S LARGE-FLOWERED HYBRID GAILLARDIA.

This is the brightest coloured and most free blooming of all the Gaillardias, as well as the hardiest: in most situations outdoors it is perennial. An established plant covered with these gorgeous flowers is a sight once seen not easily forgotten.

Per pkt., 6d.

WHEELER'S LARGE FLOWERING PHLOX DRUMMONDII.

These new large-flowered varieties are most valuable for bedding; they come true from seed. For early blooming sow in pans or frames, and grow on under glass—harden off and put out in May with the general bedding plants. A splendid succession of these handsome flowers may be obtained by sowing the seed in the open ground in April; these will continue in bloom until frost.

Per pkt., 6d.

12 Splendid Varieties, separate colours, 2s. 6d.

A List of a thousand of the finest Flower Seeds in cultivation, gratis and post free.

GEO. COOLING & SONS'
STRONGLY RECOMMEND THE
New Giant Lily of the Valley.

Fortin's New Large-flowered Lily of the Valley is quite distinct. Being twice the size and substance of the ordinary variety, it produces long, stiff stems and flower-spikes averaging one foot in length, the individual bells being of immense size, and often 18 to 20 on a spike. For pot culture it is unsurpassed, and it will thrive in any ordinary soil out of doors. A most valuable acquisition, which should be found a place in every garden. Strong flowering crowns, per doz., 2s. 6d.; per 100, 15s., post free.

COOLING'S NEW SEED CATALOGUE contains a full list of choice Bulbs and Roots selected for spring planting, forwarded gratis and post free.

6d. A LOT. 6d. A LOT.

FOR A FEW WEEKS ONLY.

Changing land, over 4 acres must be cleared.

Magnificent Hardy Perennials, Spring-Flowering Plants, Climbers, Roses, Vegetable Plants, Herbs, &c.

Don's miss this grand opportunity of stocking your garden with strong, healthy plants, from open Fen field (not weakly drawn-up stuff); will flower this year and last a lifetime. Best strains procurable. Cash with order. If not satisfied will return money if plants are at once sent back. 3d. extra must be sent for postage for one lot, 4d. for two lots, and so on. 5s. orders carriage paid. Extra large selected plants, 1s. a lot. Many thousands of testimonials from delighted customers from all parts of the kingdom.

Aquilegia, lovely new spurred varieties, including Chrysantha, 9, 6d. **Aquilegia,** double and single, lovely colours, 12, 6d. **Antirrhinums,** dwarf or tall, 12, 6d. **Anemone** Fulgens, brilliant scarlet, 6, 6d. **Anemone,** lovely varieties, including St. Brigid, 9, 6d. **Alyssum** Saxatile and Compactum (gold dust), 12, 6d. **Arabis** Albida, new double, pure white, 9, 6d. **Aubrietia,** blue or purple, 12, 6d. **Alstrœmeria,** Peruvian Lily, golden orange, streaked red, 6, 6d. **Perennial Asters,** various, best varieties, 6, 6d. **Achillea** Ptarmica, The Pearl, 12, 6d. **Agrostemma,** Flos Jovis, brilliant crimson, 9, 6d. **Anchusa** Italica, lovely, deep blue, 6, 6d. **Chrysanthemum Maximum,** Perfection, very fine, 6, 6d. **Cowslips,** lovel hybrids, 9, 6d. **Campanula** Gigantea, large blue, 6, 6d. **Campanula** Grandis, 6, 6d. **Campanula** Pyramidalis, blue or white, 6, 6d. **Canterbury Bells,** Calycanthema, cup and saucer, all colours, 9, 6d. **Canterbury Bells,** white, pink, blue, separate co 12, 6d. **Canterbury Bells** double and single, De lovely hybrids, 20, 6d. **Coreopsis** Grandiflora Lanceolata, 12, 6d. **Cornflowers,** Emperor W lovely blue, 12, 6d. **Carnation** Marguerite, exq double blooms, 9, 6d. **Carnations,** good do mixed, 9, 6d. **Carnation,** Grenadin, very free flowering, scarlet or white, 9, 6d. **Dianthus,** Flower of the Gods, 9, 6d. **Doronicum,** early large golden daisy, 6, 6d. **Daisies,** large double red and white, 20, 6d. **Erigeron** or **Stenactis,** charming mauve marguerite, 6, 6d. **Everlasting Pea,** red or white, 6, 6d. **Foxgloves,** Ivery's beautiful spotted varieties, 12, 6d. **Forget-me-nots,** large flowering, dwarf, blue, 15, 6d. **Gaillardia** Grandiflora, new large flowering hybrids, rich crimson and gold, 9, 6d. **Gypsophila** Paniculata, white, delicate sprays for bouquets, etc., 6, 6d. **Gladioli,** grand large flowering hybrids, 6, 6d. **Hollyhocks,** Chater's lovely doubles, 6, 6d. **Hollyhocks,** singles and semi-doubles, lovely colours, including yellow, 9, 6d. **Perennial Sunflower,** improved Miss Mellish, Rigidus, and Sparsifolia, 9, 6d. **Double Perennial Sunflower,** 6, 6d. **Iris Germanica,** large flag, splendid varieties, 4, 6d. **Spanish Iris,** lovely garden orchid, 12, 6d. **English Iris,** large blooms, beautiful variety of colour, 4, 6d. **Jacob's Ladder,** white, 9, 6d. **Lobelia Cardinalis,** spikes ex scarlet flowers, 4, 6d. **Lupins,** elegant spikes colours, 6, 6d. **Tree Lupins** (Arboreus), sw scented, handsome evergreen shrub, covered lovely flowers, yellow or new white, "Snow Qu 3, 6d. **Lychnis Chalcedonica,** dazzling scar 6d. **Lavender** bushes, sweet Old English, 3, 6d. **Montbretias,** lovely mixed varieties, 12, 6d. **Malva Moschata,** musk-scented, pink or white, 9, 6d. **Pyrethrum** Hybridum, Grandiflorum, splendid str 6d. **Pinks,** new pheasant-eye, very fragrant, **Pinks,** coloured doubles, sweetly scented, **Polyanthus,** gold-laced, etc., 9, 6d. **Pansies,** magnificent varieties, including Giant Exhibition, M moth Butterfly, Mammoth Parisian, Peac toria, Emperor Frederick, Lord Beaconsfie 6d. **Pansies,** purple, blue, white, and yellow ding, 12, 6d. **Poppies,** handsome Oriental and scarlet, 9, 6d. **Poppies,** Iceland, 5 colours, **Polemonium,** lovely blue, 9, 6d. **Physalis,** W Cherry, giant strain, 6, 6d. **Rocket,** sweet purple or white, 12, 6d. **Rose Campion,** **Rudbeckia** Newmanii, very fine, 6, 6d. **Sweet Williams** Holborn Glory, Hunt's Superb, etc., 15, 6d. **Scabious,** lovely colours, 9, 6d. **Spiræa,** lovely new son, 3, 6d. **Solidago,** Golden Rod, tall, 6, 6d. **Solidago** Shortii, new dwarf varieties, 3, 6d. **Rockery** Plants, assorted, 6, 6d. **Saponaria** Ocym rockery or edging, 12, 6d. **Tunica Saxifraga** lovely for rockery, 9, 6d. **Viola,** choice varieties, 15, 6d. **Valerian,** old crimson fa 12,-6d. **Wallflowers,** blood red, gold, and love hybrids, 30, 6d. **Ampelopsis** Veitchii, self-cl 3 years, 1, 6d. Climbing **Honeysuckle,** 1, 6d. low or white **Jasmine,** 1, 6d. White or blue **Clematis,** 1, 6d. **Rambler Rose,** 1, 6d. **Bush Roses,** **Sweet Briars,** 2, 6d. **Hops,** true Kentish, roots, full of shoots, 4, 6d. **Delphiniums,** choice hybrids, 6, 6d. **Phlox,** grand named varieties, 3, 6d. **Hydrangea paniculata,** enormous heads bloom, 3, 6d.

Cabbage, 4 best table varieties, Giant Winter **Onions,** Dwarf and Drumhead **Savoys, Brussels Sprouts, Pickling Cabbage, Sprouting Broccoli, Curled Kale, Thousand-headed Kale,** 75, 6d.

Rhubarb, 2-years-old roots, 4, 6d. **Seakale,** large crowns, true solid ivory, 3, 6d. **Strawberry,** fruiting plants, Paxton, Noble, Sovereign, 25, 6d. **Fennel,** 8, 6d. **Mint,** 12, 6d. **Sage,** 9, 6d. **Marjoram,** clumps, 6d. **Parsley,** 20, 6d.

Trial order solicited. **No callers,** please. Catalogue free.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Garden Annuals.

For a long period there was full justification for the complaints that were so frequently made to the effect that annuals were not used in the embellishment of the flower garden in proportion to their merits, or grown in such manner as to ensure the development of their distinctive characteristics to the fullest possible extent. These causes for complaint have not as yet been wholly removed, but there has of late years been so marked an improvement both in the appreciation in which they are held by the flower loving community, and in their cultivation, that it is now possible to regard the progress that has been made with considerable satisfaction. The finer kinds are now grown somewhat largely, and with the clearer views that obtain with regard to their cultural requirements they contribute in no small degree to the summer attractions of many of the most beautiful gardens in the United Kingdom. This change in the estimation in which these subjects are held is in part due to the immense improvements that have been effected in them, as the result of unremitting endeavour on the part of the seedsmen and the facility with which they can now be included in the summer arrangements. When, as was the case for a long series of years, the plants were massed in beds or borders, or arranged to form divers patterns, it was practically impossible to employ annual flowers otherwise than in comparatively small numbers. But few of them could be made to fit in an elaborate colour scheme, and of these a very small proportion could be depended upon even under the most favourable conditions to continue to bloom until the close of the season. With the mixed style of planting that now enjoys so high a degree of popularity the difficulty of using them extensively has disappeared, and they can now be so associated with both hardy perennials and tender bedders as to produce the most delightful effects. Moreover, in mixed beds and borders the general effect is not materially impaired if a few of the clumps become exhausted before the end of the season. On the other hand, when in accordance with the old practice the plants used in the production of the summer displays were arranged in large masses, many of the beds containing but one kind, the collapse of any particular subject was a very serious matter. The improvements that have been made by judicious cross fertilisation and careful selection have greatly enhanced the value of annuals for garden decoration, inasmuch as they include a more vigorous habit as well as flowers of a higher quality and a wider range of colours. So materially have they been improved that it would be difficult to overestimate the splendid work that has been accomplished by the various firms engaged in the production and distribution of flower seeds. Especially is the value of this work evident in the newer types of asters, candytufts, centaureas, chrysanthemums, eschscholtzias, godetias, nemesias, Drummond's phlox, poppies, salpiglossis, scabious, stocks, sweet peas, and zinnias. It is hardly necessary we should refer otherwise than briefly to these important classes, but it may with advantage be pointed out that they include some of the finest of the flowers of annual duration, and should be given prominent positions in the flower garden. With regard to these, as to other classes, the self-evident fact may be stated that the same time and attention are required in the cultivation of inferior types as in those of the highest quality, while the effect produced is much less satisfactory; therefore, as the difference in the cost of seed of the two types is relatively small, that of the best only should be purchased and sown. If there be occasion for the exercise of the greatest economy in seed buying, the reduction in the cost should be effected by the purchase of a smaller quantity rather than by obtaining seed of a second rate type, and care be taken to fully utilise the whole of the seeds contained in each packet. In not a few instances a reduction in the quantity of seed available will be a distinct advantage, as the smaller number of seeds may have the effect of inducing cultivators to sow and plant more thinly than has hitherto been considered desirable. In the sowing of seeds of annuals, and in planting out those raised under glass, there is still much room for improvement, for seldom is sufficient space allowed for them to attain their full development and give their full complement of flowers. There has been a considerable improvement upon the old practice of sowing the seeds as thickly as those of "mustard and cress," and then thinning the seedlings to a distance of two or three inches apart, but as a rule room enough is not given for the plants to branch freely and thereby produce a succession of flowers extending over the whole season. Not only is enough space for the free development of lateral growth necessary, but it is essential to success that the soil be deeply dug and liberally enriched, and the plants thereby placed under the conditions favourable to their making a sustained growth.

MR. R. IRWIN LYNCH, M.A., V.M.H.,
Curator of the Cambridge Botanic Gardens.

Mr. R. Irwin Lynch, V.M.H., whose portrait graces the first page of this issue, has occupied the position of curator of the Cambridge Botanic Gardens for nearly thirty years, and during this period he has won the golden opinions of all who are acquainted with him and his work. Early in life, Mr. Lynch, like many other successful botanists and horticulturists, had the opportunity of spending several years in the Royal Gardens, Kew, and that he was careful to take full advantage of this has been made abundantly evident in the course of his career. While at Kew Mr. Lynch attained to a position of considerable responsibility, and in the fulfilment of the duties belonging thereto he achieved so high a degree of success that when the curatorship of the Cambridge Botanic Gardens became vacant he was appointed thereto. Going to Cambridge with a thorough knowledge of systematic and physiological botany and practical horticulture, those who were acquainted with his great natural abilities and aptitude for sustained effort were most sanguine in their anticipations with regard to the position to which he would attain. These anticipations have been more than realised, for the gardens of which he is curator have become one of the most important botanical establishments in the provinces, and he has become one of the principal authorities on several classes of plants of much importance. Mr. Lynch has been especially successful with the iris, to which he has devoted much attention, and his "Book of the Iris" is a model of its kind, and indespensable to those who take an active interest in these beautiful plants. The gardens under Mr. Lynch's care have acquired considerable fame for the comprehensive collection of hardy opuntias that he has succeeded in forming and cultivating so successfully. Mr. Lynch has also devoted considerable attention to the gerberas, and as the result of his labours a fine race of these distinct and beautiful plants has been created. The splendid work that has been accomplished by Mr. Lynch is fully recognised at Cambridge, as proved by the fact that two years since the University conferred upon him the degree of Master of Arts. Elsewhere his efforts in the cause of botanical science are highly appreciated, and as a mark of their appreciation the Council of the Royal Horticultural Society conferred upon him in 1906 the Victoria Medal of Honour in Horticulture.

The "Gardeners' Magazine" in 1908.—During the current year beautiful and interesting gardens will receive prominent attention, and will be freely described and illustrated. We shall make a special feature of illustrated descriptions of the great gardening districts in the United Kingdom. These will appear at regular intervals throughout the year. We commenced the series with an account of the horticultural features of the Isles of Scilly in the issues for January 4 and 11, followed in February (8 and 15) by descriptions of the more noteworthy gardens in the district of which the Sussex town of Horsham is the centre, and in this issue we give the first of the two articles descriptive of some of the more famous Cornish gardens. Special attention will also be given to garden architecture: rock, mural, and water gardening; hardy border flowers; roses and carnations; chrysanthemums; and sweet peas; orchids and their cultivation; birds and insects; plants and flowers from seeds; fruit culture in the open and under glass; the kitchen garden; and scientific horticulture and novelties. We shall continue to make a special feature of illustrating successful examples of cultural skill, artistic arrangements, and new plants, flowers, fruits, and vegetables. We would add that the rate of subscription is: One year, 10s. 6d., post free; six months, 5s. 6d., post free; to foreign countries, 15s. per annum, post free.

Absorptive Power of Peas.—In experiments recently conducted by Mr. A. D. Darbishire it was proved that a wrinkled pea takes up a larger amount of moisture during germination than a round pea, and that cross-bred peas, between round and wrinkled varieties, were intermediate in this absorptive power, between the parents.

British Gardeners' Association.—A public meeting of the association will be held at Carr's Restaurant, 264, Strand, W.C., on Saturday, March 7, at seven o'clock, when Mr. George Gordon, V.M.H., will preside, and an address on the work of the association will be delivered by Mr. J. Weathers, secretary of the association. This meeting is being held especially for the employees in the London parks and Metropolitan gardens, and a very large attendance is expected.

Paris Rose Show.—M. J. Gravereaux, the well-known rosarian of Hay, has called our attention to the exhibition of roses that he is engaged in organising. The exhibition will be held in that part of the Bois de Boulogne, Paris, known as Bagatelle, and will be devoted to varieties introduced in 1907 and 1908. Their merits will be determined by a competent jury appointed by the Municipal Council of Paris and the Prefect of the Seine, and this jury will meet in the first fortnight of June. Rosarians in this as in other countries are invited to contribute to the exhibition the varieties that they are distributing this year. Those who purpose taking part in the exhibition are requested to send a list of their varieties, with particulars as to the types to which they belong, the names of the varieties from which they have been obtained, and the names of the raisers and the places of origin, for the purpose of entering the roses in the catalogue and inscribing their names, etc., on the tallies to be affixed to them. The roses must be despatched to 4, Avenue de Villars, to reach there not later than the 14th inst.

Cigars from London-Grown Tobacco.—Cigars made from tobacco actually grown in London may appear an impossibility, but that is by no means the case. A portion of the 1906-7 tobacco crop grown experimentally in the gardens of the Royal Botanic Society, Regent's Park, has been properly cured and manufactured. The plants, as mentioned in these pages, were shown at the last International Tobacco Exhibition, and at the next exhibition, which will be held at the Horticultural Hall in the course of this month, the cigars made from their leaves will be shown. These cigars, it may be added, are smokable, though it is probable that a certain measure of patriotism and London pride is required to rise to the level of their aroma and taste. The growers of the London leaf and the makers of Flor de London do not claim to rival Havana. What they claim is to have established a record that of having produced and worked up into cigars a crop of tobacco grown in London, and this claim is fully justified.

Eaglesfield Park, Woolwich, a new open space of about nine acres, was opened to the public on Saturday, February 29. The park was purchased for £4,541, and as it is on the summit of Shooter's Hill, 420ft. above sea level, it commands extensive views over Kent and Essex. Mr. Ambrose Pomeroy, vice-chairman of the Parks Committee of the London County Council, presided at the opening ceremony.

Visitors to Kew.—We have already stated that the visitors to the Royal Gardens, Kew, during 1907 numbered 2,962,714. It is interesting to notice that this shows an increase of 623,222 upon the visitors during 1906. The average number of visitors for the ten years 1893—1902 was 1,352,425, so that the record for 1907 was more than double that average. The average attendance for 1903—7 was 2,011,748, the figures for the several years being respectively 1,352,548, 1,579,666, 1,824,319, 2,339,492, and 2,962,714. The total Sunday attendance for the same years amounted to 568,726 in 1903; 675 225 in 1904; 853,631 in 1905; 867,148 in 1906; and 1,268,501 in 1907. These figures prove how increasingly popular these National Gardens have become.

Spangle-galls of the Oak Eaten by Birds.—We learn from the "Kew Bulletin" that in October, 1907, a small packet of "seeds" was received at Kew from Mr. F. Monteith Ogilvy, Ledaig, Argyllshire, N.B., together with a letter in which it was stated that the contents of the packet had been taken from the crop of a Grey-hen (the female black grouse), shot on October 17. The crop of the bird was found to be full of these "seeds" and an immense number of small black beetles; a few days later the crop of a Black-cock was found with similar contents. The supposed seeds, which were yellowish-green and smooth, proved to be the common spangle-gall of the oak leaf (Neuroterus lenticularis), the characteristic hairs having been rubbed off. Again in December the contents of the crop of a pigeon (a bird of the year), shot close to Pembroke, were received at Kew through the Board of Agriculture and Fisheries, and in this case also the crop contained a large quantity of the common spangle-gall.

A Rubber Exhibition is to be held at the Royal Horticultural Hall, Westminster, in September next, and, remembering how great is the interest taken and how large the amount of money invested in the rubber industry, the exhibition should prove successful and educational.

Colpomenia sinuosa, a brown Alga found in the Mediterranean and other warm waters, has been discovered at Torquay and Swanage, and it seems to have established itself at both places. This seaweed has not hitherto been known to live nearer England than the coasts of Southern Spain and France, and, though the discovery is an interesting one, it has its drawbacks, because Colpomenia sinuosa has the capacity of doing much damage to oyster beds.

Sir George A. Cooper, Bart., of Hursley Park, Winchester, who was president of the National Sweet Pea Society during 1907, has been appointed by his Majesty to serve as Sheriff of the County of Southampton during the ensuing year.

Presentation to Mr. G. P. Miln.—On Saturday evening last Mr. A. W. Armstrong, the president of the Chester Paxton Society, entertained the officers and members of committee with a few friends at dinner at the Blossoms Hotel, and advantage was taken of the event for making a presentation to Mr. G. P. Miln, the hon. secretary and treasurer. Mr. Miln has occupied the dual position for upwards of sixteen years, and so admirably has he discharged the duties associated therewith that the society has greatly increased in strength and influence. When in 1891 Mr. Miln added the duties of honorary secretary to that of treasurer, there were 80 members, and now there are 341, the classes at the exhibitions had been increased by 44, and the prize-money by £62. Appreciating the value of the service that had been rendered by Mr. Miln, the committee decided to ask his acceptance of the society's gold medal suitably engraved. The presentation was, in the unavoidable absence of Mr. N. F. Barnes, made by J. D. Siddall, who paid a warm tribute to Mr. Miln's abilities.

Our Coloured Plate.—With this issue is presented a plate in colours of early flowering tulips, which form the subject of an interesting article in the current issue from the pen of the Rev. J. Jacob.

WEEPING STANDARD ROSES.

In a recent issue of the Gardeners' Magazine (February 1) I dealt somewhat fully with standard roses of the ordinary type, with a view to bring into greater prominence their usefulness in the flower garden, and the conditions under which they can be grown to the highest degree of perfection. It will be remembered by many of my readers that I strongly advised a more liberal use of standards of hybrid perpetuals, hybrid teas, and tea-scented varieties because of their value in relieving the flatness so common when dwarfs are grown alone, and of the charming appearance presented by the huge bouquets of bloom they produce when in a robust state of health. Attention was also directed to the importance of selecting varieties that are by reason of their vigorous habit of growth especially adapted for cultivation as standards, and the desirability of having plants that have been worked on comparatively young stocks. The necessity for good cultivation was insisted upon because of the impracticability of having specimens with large heads when the soil is indifferently prepared and allowed to become more or less exhausted of plant food.

Much that was written with regard to standard specimens of the varieties of the three sections mentioned will apply with equal force to standards of rambling, and other roses of a weeping habit. It is not necessary, or even desirable, to plant them otherwise than sparingly in the rose garden; but they produce an effect so distinct and pleasing when planted in suitable positions and placed under the conditions favourable to the full development of their growth, that a few specimens should be regarded as essential to the proper furnishing of that part of the garden devoted to roses. There is hardly any part of the garden in which they are not highly effective; but they appear to the greatest advantage when assigned positions in the rose garden where each specimen can have a small circular bed wholly to itself. They ought also to be distributed with some degree of regularity over the area. They might be arranged alternately with beds of dwarfs or ordinary standards alongside the principal walks in the rose garden, as the combination is an exceedingly good one. It is an excellent plan, and specially where the roses are not grouped together in an area somewhat shut off from the pleasure grounds, to have oblong or oval beds filled with dwarfs and standards alongside one of the main walks, and to plant a weeping standard between every two beds. The size of the mixed beds and the distance apart must be governed by the size of the garden, the width of the walk, and the taste of the owner. If the beds are of comparatively small size the preferable course will be to have two between the standards. There are two good reasons for taking this course; one the loss of dignity when the standards are a short distance apart and the other their comparative expensiveness. With reference to the latter point it may be well to state for the purpose of avoiding misapprehension that weeping standards are not unduly costly, but they are necessarily more expensive than ordinary standards, and the planting of a considerable number involves a considerable outlay.

Later in the season I may say something about the preparation of weeping standards, but for the present I shall confine myself to the points that should have the attention of those who are desirous of obtaining at once standards by purchase at the nurseries. Seven or eight feet is a suitable height for standards of weeping varieties, and the stocks should be stout, quite straight, and with a healthy brownish green bark. Previous to the rose being planted a stout iron stake should be driven firmly into the centre of the station, and this should be of a length that will allow of it being, when firmly fixed in the ground, the same height above the level of the soil as the rose. It follows as a matter of course that the rose be carefully planted, and the soil trodden firmly about it, that the stem be securely fastened to the iron stake, and that two or three liberal waterings be given during April. It is advisable to prevent the bark of the stem coming into contact with the iron, and this can be readily done by binding a small hay or straw band, or a piece of cloth round the stake at the points where the stem of the rose will be secured to it. In all cases it is advisable to put a strip of cloth round the stem to prevent the string injuring the bark. Generally speaking the pruning will consist chiefly in cutting out the old and exhausted wood and leaving the growths of previous season to take its place, after a few inches have been removed; but the first season all the shoots should be pruned rather hard back to ensure strong growths from their base. When the roses are well established and growing vigorously, an iron hoop about three feet in diameter may be fixed four feet or so above the ground level for the purpose of so regulating the growth as to produce well balanced specimens. These hoops can be supported by two or three iron rods.

A large number of varieties is not necessary, and the following selection may be suggested as comprising the finest of the varieties suitable for culture as weeping standards: Alberic Barbier, Blush Rambler, Dorothy Perkins, Flora, Dundee Rambler, Hélène, Felicité et Perpetué, Hiawatha, Jersey Beauty, Lady Gay, and Tea Rambler. Viator.

A BEAUTIFUL WEEPING STANDARD ROSE.
In the gardens of Town Close House, Norwich, the residence of E. T. Boardman, Esq.

Large Chrysanthemum Blooms.—On page 102 Mr. Molyneux invites me to show him blooms of F. S. Vallis sixteen inches in diameter. Permit me to say I do not believe such blooms ever existed in fact. The figures I took from Mr. Molyneux's own article on p. 333, December 8, 1907, and from a paragraph over the signature of "Sadoc" on p. 40 of the Gardeners' Magazine of January 11.—R. Barnes, Malvern.

GARDEN SEATS—I.

Leigh Hunt has written, "Oh for a seat in some poetic nook"—and how often in passing through a garden has one's own heart echoed that desire. Poetic nooks there are in plenty, and of garden seats there is no lack, but putting the two together has, apparently, in many cases, never occurred to the proprietor of the domain, and we have to take our choice of either resting on a seat commanding no particular view of charm, or feeling of peace, or, having found such a spot, must needs enjoy it standing, or court present discomfort, or possibly future pains, by reposing on the ground.

The disposal of seats in the garden is a matter that should claim the utmost thought and attention, both as regards their position in the landscape, the sense of their own picturesque value, and also the pleasing and restful effect of their surroundings on those who make use of them. For a seat to be merely an object to sit upon is to give it but a tithe of its opportunities. It should invite. It should give us just what we feel expressly in need of at the particular moment in the way of sun or shade. How many gardens are there whose seats have either permanently retired, like evil spirits, to the gloomy shadow of evergreen trees, or else stand, summer and winter, on a terrace or lawn, to which ladies are forced to carry their own shade with them in the shape of hats or parasols, poor substitutes for the cold fragrance of green branches?

Your seat should, above all things, offer rest and refreshment to the mind, the shadowy beauty of woodland in the summer, with, if possible, the audible sound of cool, running water, or harmonious voice of fountain or waterfall; and in the springtide of the year, a glimpse, in the near distance, of a primrose or bluebell-decked copse, with its orchestra of birds and little comedies of wild life for entertainment; a distant view of gently-sloping green cornfields, scarlet with poppies, or the crimson and golden glory of autumn. Very acceptable is a terrace with as cheery a scene as possible for the rare days of winter sunshine—a terrace to which one's feathered players of the April days shall transfer their stage, and titmice, robins, squirrels, and other little people of the woods, augmented, possibly, by visitors from foreign climes, shall give their performances by way of thanks for hospitality received. Let the garden offer of its best to those who rest awhile therein, particularly let it bring its perfumes for their refreshment, and let no old stone seat or quaintly-fashioned bench be set up without planting by it some fragrant flowers, to give a charm to present thoughts, and suggest, with that subtle power that all scents possess, the happy memories and fancies of the past.

If one has the advantage of beautiful views in the garden, a glory of colour, or a still pool, what is more to be approved of than the provision of some seat on which to rest and admire the charming sight, and to let the full beauty of the scene impress itself upon the retina of the mind? Yet how often are such opportunities neglected in the garden? And the chance of admiring to the full some lovely view in peace and quietness, or of resting after an arduous climb or lengthy walk is, unhappily, too frequently conspicuous by its absence in our gardening schemes.

S. W. Fitzherbert.

THE BEST SIX LONG KEEPING APPLES.

My remarks upon this subject will refer to culinary varieties of apples only, and the opinions given will be entirely confined to varieties that are capable of being kept in good condition until well on in March. These varieties we have cultivated here for a period of not less than fifteen years, so that it cannot be considered my judgment has been formed without fair experience. Further, we have a very good and representative collection of the leading varieties of apples, and the number of trees grown of each ranges from seven to thirteen.

Annie Elizabeth.

This variety is of compact, upright, clean growth, but does not bear well for several years after being planted; in fact, we at one time thought of regrafting our trees with another variety, but after they became well established they cropped well, and in some seasons they yield heavily. The fruits are large, solid, and handsome, and of first-rate quality; it is a variety well worth waiting for.

Bramley's Seedling.

As with the foregoing variety, trees of this do not crop satisfactorily while in a young state, at which stage, if grown as bushes, they may be improved in this respect by being root pruned. It is a robust grower, and is best when grown as a standard, under which condition a farmer friend, who grows a goodly number of varieties, considers it the best of the late keepers. Its fruit is very large, flattish, heavy, and briskly flavoured.

Hormead Pearmain.

This is one of the most regular and good croppers, and a long keeper, but it does not appear to be so generally planted as it deserves. The tree makes clean, free growth, and its fruits are moderately large, of conical shape, and though greenish-yellow in colour, it is handsome. It cooks well, and is also valuable for dessert in spring where apples are scarce.

Lane's Prince Albert.

Amongst choice apples this must be classed as one of the most fruitful; it is generally so fruitful, in fact, as to necessitate severe thinning. It is large, and, especially when exposed to the sun, particularly handsome. Its flavour is of the best, but some cooks object to the colour of the flesh after cooking. Its habit of growth is not wholly satisfactory, though it makes a better bush, or pyramid, than a standard. In the case of dwarf trees even it is often difficult, owing to extreme fertility when in a young state, to procure suitable wood to form good, shapely, full-sized trees.

Newton Wonder.

Taking every quality into account, I consider this the most valuable apple of my selection. It is of excellent constitution, and makes a splendid free-growing and free-bearing tree, either as a bush or standard. Its fruits are beautiful in shape and colour, large and heavy, and among the latest of keepers. This variety is being commonly planted in orchards in this district.

Dumelow's Seedling.

This is a well-known sharply flavoured and splendid cooking apple of medium size. It makes a prolific, well-shaped bush, but is in some places subject to canker, though here, planted upon a heavy, well-drained soil, it is almost exempt from this plague. The variety is best known as Wellington.

T. Coomber.

The Hendre Gardens.

LILACS.

Now that flowering shrubs are obtaining their proper position, choice varieties of lilacs will add interest to the garden during May and June.

Thanks to the energy of our French neighbours we have now quite a long list of varieties to choose from. Having a strong love for the better lilacs I venture to give a selection of desirable varieties.

Double Flowered Varieties.

Among white flowered varieties we have now several to choose from. Mdme. Abel Chatenay is quite one of the best; it has immense spikes of pure white blossoms. Mdme. Lemoine is an extra good variety, giving huge panicles of pure white flowers; this is a good variety for growing in pots. Mdme. Casimir Perrier is newer than the preceding, and is in every way a charming variety.

Of varieties of more recent introduction Miss Ellen Willmott is one of the finest, giving large trusses of snowy whiteness. Jeanne d'Arc is another of quite recent introduction. Taglioni, porcelain white; Banquise, and Mdme. de Miller are also quite new, the latter is a dwarf-growing variety.

Of coloured sorts the following are desirable; Alphonse Lavallee, very large panicles, blue, shaded violet. Charles Joly, dark purple, the finest of dark colours. Countess Horace de Choiseul, creamy white, shaded rose. Comte de Kerchove, rose, very free. Doyen Keteleer, pale rosy-lilac, large spike. Emile Lemoine, flowers large, panicles of fine globular form, colour lilac. La Tour d'Auvergne, flowers very double and large violet-purple. Mdme. Jules Finger, satiny-rose, very fragrant. Sauvenir de L. Thibaut light red, reverse of petals white. President Carnot, large panicles, pale lilac. Leon Simon, coral buds, changing to blue. Condorcet has large spikes of blue flowers. Mary Micheli, clear lilac-blue. Renoncule, pale mauve. Michael Buchner, pale lilac with pink margin. President Grevy, cobalt blue with rosy edging.

Among quite new varieties Dr. Troyanowsky has enormous flowers, blue, changing to azure. President Loubet, deep purple red, buds carmine, is one of the darkest. Maurice de Vilmorin has very large flowers, blue with a white eye. Waldeck Rousseau has extra large flowers, rose-lilac, white towards the centre, a charming colour.

Single Varieties.

Of single flowered varieties the following are good: Souvenir de Louis Spath, long panicles, individual flowers large, dark purple, quite one of the best lilacs in cultivation. Marie Legrave, an exceptionally free flowered white sort, valuable for forcing. Ville de Troyes, dark purple, distinct. Mdme. Briot, bright red. Gloire de Lorraine, red buds, changing to lilac. Philemone, dark red. Professeur Stockhart, blue-lilac. Triomphe d'Orleans, light blue, good habit. Gloire de la Rochelle, rose-lilac, changing to a pale blue. Beranger, blue-lilac, very free. Duchesse d'Orleans, pale blue, very free. Mdme. Kreutzer, large spikes of vinous red flowers. Toussaint Louveitre, dark crimson, changing to dark violet. L'Oncle Tom, deep violet-purple, large spikes. Pasteur, erect trusses, large flowers, colour wine-red, changing to mulberry-red.

E. Molyneux.

BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in The Amateur's Greenhouse, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London

SENECIO TANGUTICUS.

The introduction of this comparatively new ragwort to small and narrow borders has proved disastrous to many plants growing in association with it, and many have been compelled to regard it as more than an ordinary nuisance where space is limited. Its vigorous aggressiveness is, however, an excellent feature in the informal garden, the wild garden, and in woodland planting, as it proves beyond doubt it can take good care of itself, and in such positions the plant possesses a measure of attractiveness that well accords with its surroundings.

Studied as a border plant it falls short of a given standard of excellence by many points, its root system beats perennial sunflowers hollow in sheer aggressiveness, its inflorescence when studied at close quarters lacks refinement, and as a robber of plant food it has few equals. There is a saving grace in its handsome leafage, for the three months of summer, however, but this is not enough in a good border plant.

Used in the wild garden there is a different tale to tell, and it is probably in this sphere that its greatest garden value will be realised. It has all the characters of a plant that appears at its best in broad groups destined to be viewed twenty yards distant, and one can recommend it for rough broken ground disposed at this distance from the approach. Grouped thus it is decidedly picturesque, the leafage loses none of its elegance, the stout stems, two yards high, are in clear outline, and the giant panicles of few-petalled yellow flowers become distinctly plumy in appearance. Nor is this all. The silky pappus that follows the flowers give a silver-grey cloud of surpassing beauty, a feature that should do much to render this plant popular for sites difficult of cultivation.

G. B. Mallett.

CYMBIDIUM WINNIANUM.

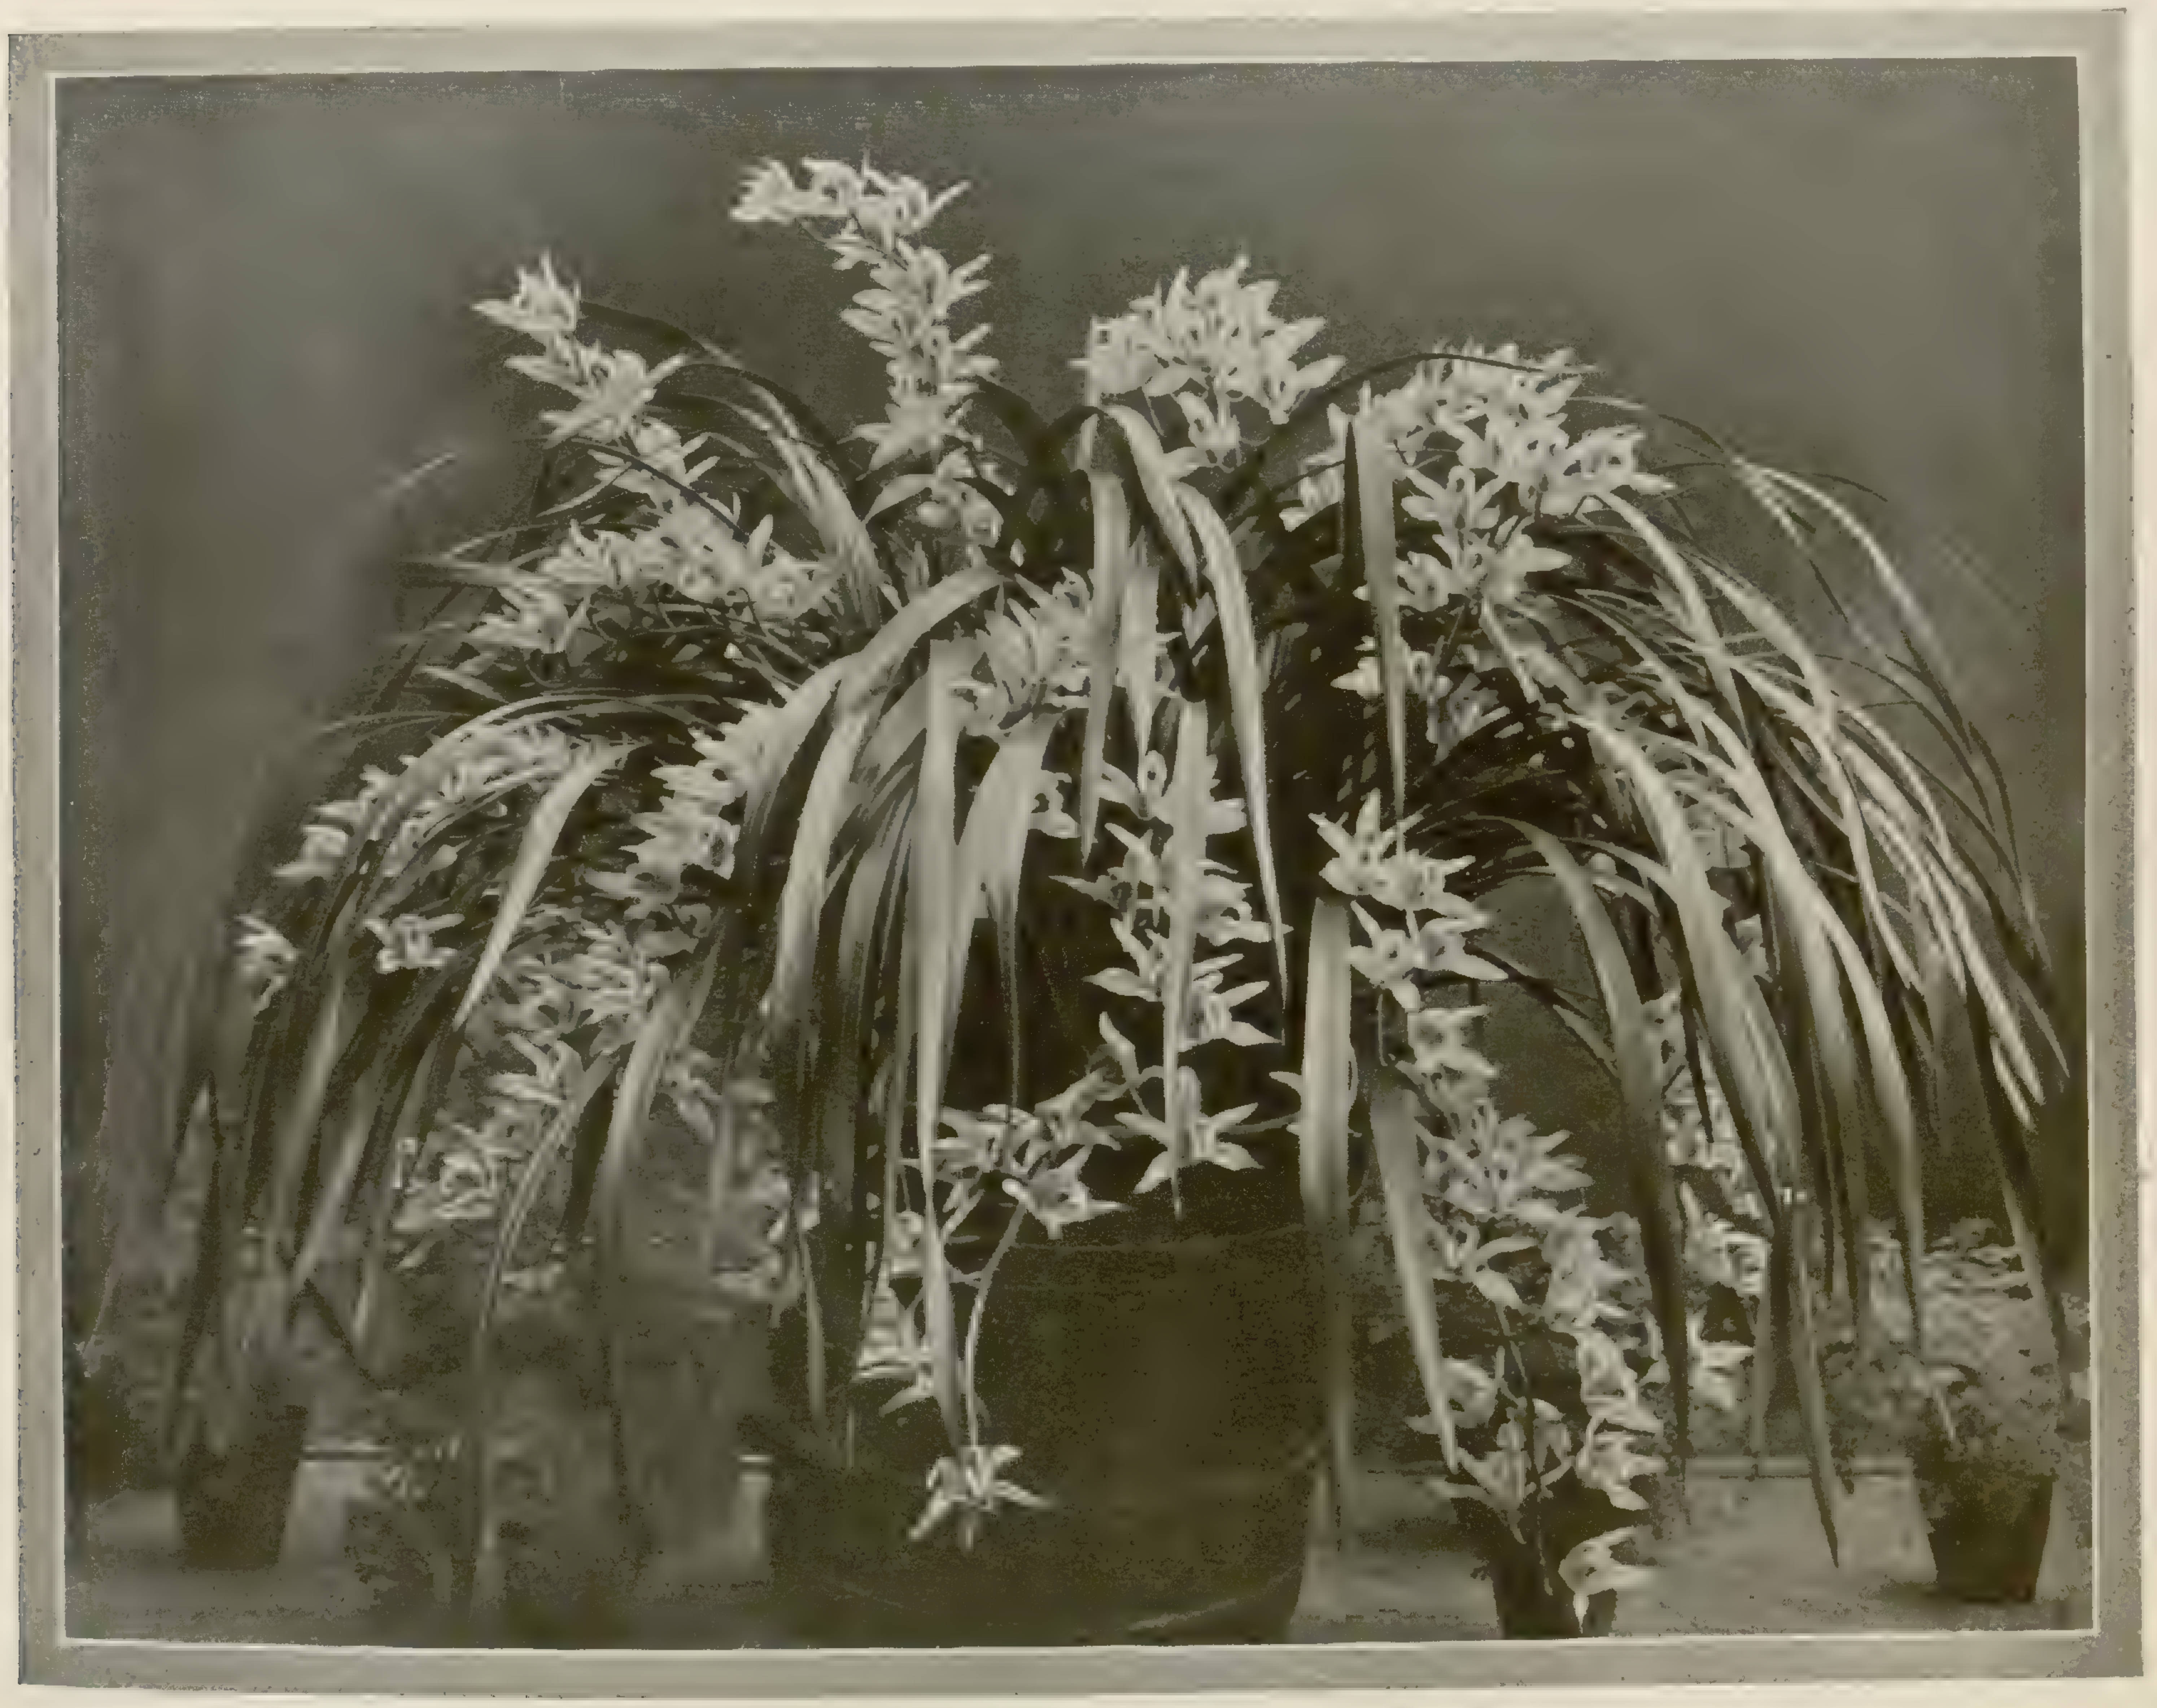
This distinct and handsome cymbidium was the second raised hybrid member of the genus. It was raised in the collection of Charles Winn, Esq., of Selly Hill, Birmingham, reputedly from C. giganteum and C. eburneum, and when a plant of it was shown by Messrs. Sander and Sons in 1891 it received a First Class Certificate from the Royal Horticultural Society. From the outset there was a suspicion that there was some mistake as to parentage, and since then it has been proved that C. Mastersi, and not C. eburneum, must have been the pollen parent. The accompanying illustration, which represents a noble specimen of this fine orchid, is reproduced from a photograph taken early in the year, of a plant as it flowered in the collection of Major G. L. Holford, Westonbirt, Tetbury. The plant bore twenty-one spikes, and an aggregate of two hundred and twenty flowers, the best spikes carrying fifteen flowers each.

Here the cultivation of specimen orchids is aimed at, and with a fair amount of success, and especially with terrestrial kinds. Eight years ago this particular plant was growing in a six-inch pot, now it is accommodated in a teak-wood tub eighteen inches in diameter, and no further disturbance is anticipated for some few years to come.

This hybrid has now many beautiful companions, thanks to the ardent hybridist. Nearly all are vigorous-growing plants, and therefore not adapted for small houses, but where head-room can be provided no more stately and beautiful orchids than the showy members of this genus can be desired. They are free blooming, healthy growing plants when properly attended to, and have few equals as regards the lasting qualities of flowers, either remaining on the plant or in a cut state. The plants soon grow into specimens, and it is only when thus seen, a picture of health and vigour, and well flowered, their full beauty can be realised. Full cultural details are not necessary here, as these are always dealt with so admirably in the proper season in the weekly orchid calendar. I may, however, add that in the cultivation of cymbidiums the mistake that used to be made was in treating them as if they were epiphytes. It should be borne in mind they are terrestrial orchids, and it is obvious that a substantial compost is necessary for them to root in. Another mistaken idea was that of growing them in too high a temperature. This has, however, proved to be erroneous, as the plants thrive best in a temperature slightly higher than that generally afforded odontoglossums, and with an abundance of fresh air.

H. G. Alexander.

Westonbirt Gardens.



CYMBIDIUM WINNIANUM.

A fine specimen in Major G. L. Holford's collection at Westonbirt.

PERPETUAL CARNATIONS FOR PRIVATE GARDENS.

It has, I think, long been recognised by practical men that what pays the market grower is also, in a great measuré, equally useful to the private gardener, excepting perhaps that some shades of colour may not be favourites with all owners of gardens.

The ever-increasing popularity of the perpetual-flowering carnations, their beauty, and usefulness as cut flowers, and for personal wear, and their comparatively easy culture places them in the front rank of winter-flowering plants, and, indeed, which may be flowered the year through if properly attended to.

PERPETUAL-FLOWERING CARNATION DUCHESS OF PORTLAND.
Award of Merit, R.H.S. Flowers, soft pink.

While it is not altogether necessary to build special houses for these plants, yet where a large display of bloom is required at one time a good house should be allotted to them, and this, with the addition of pits for bringing on the successional batches of plants, will give the cultivator all the accommodation necessary for the production of good blooms. There are, however, many gardens where existing glass structures that have been used for other purposes have to answer for carnations, and if they are light and airy, and the plants can be kept near the roof glass, such houses or pits answer well for the purpose. We grow and flower our plants chiefly in span houses or pits, the path running through the centre, and the stages on both sides. These pits have been used in former years for different purposes, among others for the culture of pineapples, and they make excellent places for the carnations, as the plants are near the glass, with abundance of light and ventilation. Much piping will not be required, but there should be sufficient to maintain a temperature of 50 degrees to 60 degrees without the pipes becoming unduly hot, for fire-heat will only be required in very cold and very wet weather, and the pipes should not be in close proximity to the plants.

In the selection of varieties one needs the best, but colour is a question of individual taste, and what may find favour in some gardens may in others be rejected. Mrs. Lawson is not liked here as it has not a good daylight colour, but it is very effective under artificial light. This shade is very prevalent in the American varieties, and it also shows itself in many of the seedlings from Mrs. Lawson. Of pink-shaded carnations Fair Maid is still one of the best for winter-flowering, or, in fact, any season of the year. I do not admire the form of the petals, but it has other good qualities which outweigh that objection. Of the merits of Mrs. Burnett, which created a furore last year, opinions will differ; it has done very well with us, and while it continues so we shall grow it in quantity. A recent remark of mine in the "G.M." concerning this variety brought me a note of congratulation from a noted grower who utterly condemned it, and complained of the flowers being affected by "sleep." Now it would be unfair to deny the fair lady a normal amount of rest. We have not experienced this fault in our blooms; "sleep" may be due to a cultural error. I have noticed it in other pink varieties, and at times in scarlets and whites. Enchantress will still hold its own as a light pink.

Mermaid is a pretty shade of pink, and gives a medium sized, neatly formed flower; it is an English variety, but a trifle weak in the stem. Fiancee is a rough, loosely formed flower, that does not appear to have much to recommend it, except stoutness of stem. Floriana is a useful shade of pink, and has other good qualities. Duchess of Portland, a beautiful large-flowered pink variety, introduced by Messrs. W. Cutbush and Son, is worthy of extended trial.

In cerise shades we have Mrs. T. W. Lawson, Nelson Fisher, and Elliott's Queen.

Whites will include White Perfection, a perfect shaped flower, but I fear not free enough to be grown largely, still, a few blooms of this variety are worth having. Lady Bountiful is supposed to be white, but we scarcely ever have a bloom without pink markings on the petals. Mrs. Norman is a fine white, but does not produce cuttings very freely. White Lawson possesses the good qualities of Mrs. T. W. Lawson.

Scarlets will include Britannia, but this is disappointing with me; it gives a nicely formed flower of good build, but is not free enough as yet. I am inclined to think this variety requires very little pinching. Robert Craig is a strong grower, and gives well-formed flowers. St. Louis has given us some beautiful blooms, that opened clear and good; it is a rich scarlet, always attracts attention, and gives the largest flowers we grow in this colour.

Crimsons are represented by Harlowarden; Daheim, good habit and colour; President, and Cardinal.

In fancies, white and yellow grounds, there are Dorothy Whitney, beautiful yellow fancy; Ceres, Prosperity, Mrs. M. A. Patten, and Jessica—the largest flowered in this section. Imperial, the new American bicolor, is now in bloom, but is far from pleasing in colour; Helen Gould is too variable as yet.

Among recent American novelties there appears much room for a freer branching habit of growth; a strong growth, with an occasional large bloom, is not sufficient return to make them profitable even in a private garden. As the best blooms are generally the first to open on the plants, to ensure a constant supply of high-class flowers many successional batches of plants must be grown to maintain the [illegible]. We appear to require for our winter-flowering period plants of free branching habit, so that as one bloom is cut others will speedily appear. The blooms should also be formed of large petals, without small ones in the centre, as such flowers would be more serviceable for our dull winter days.

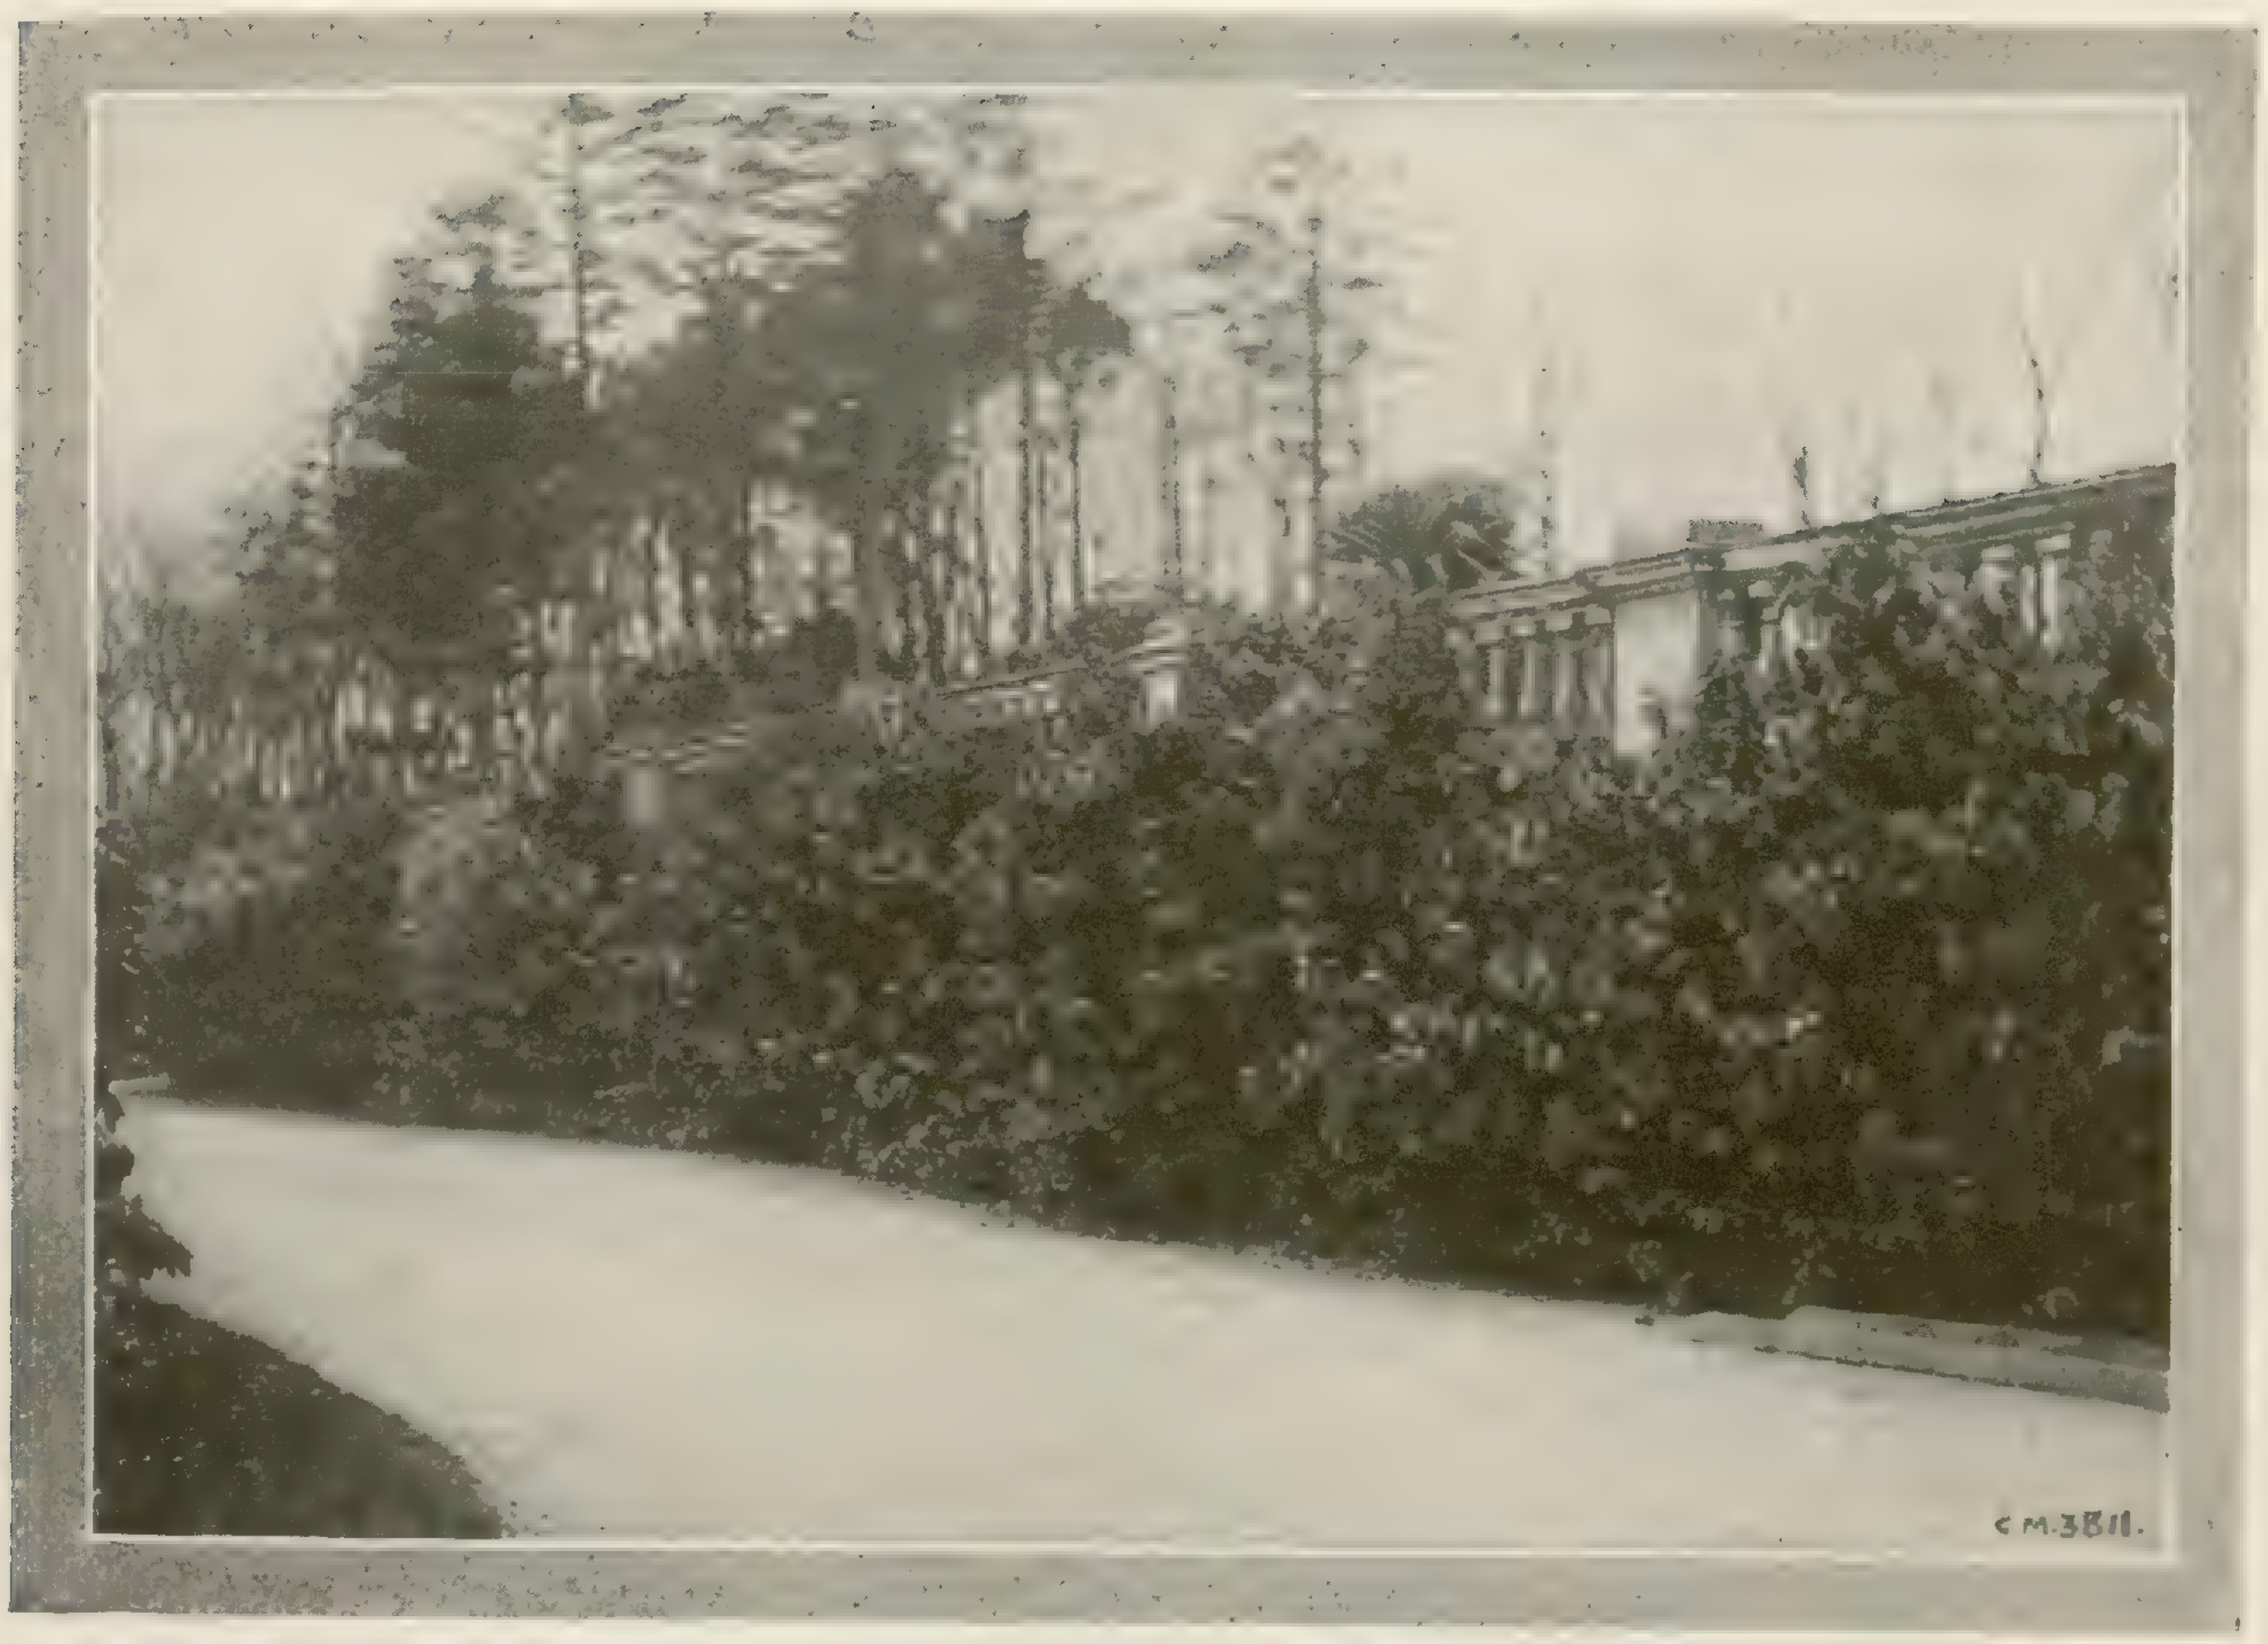
Poltimore Gardens.



CAMELLIA WALK AT TREMOUGH.

SOME CORNISH GARDENS.—I.

Because of its peninsular position the county or Duchy of Cornwall enjoys an unusually equable climate. Although it is the most southern portion of England, it cannot truthfully be called "the Sunny South." The west wind that brings so much warmth to Cornwall also brings much rain. The Falmouth district is a particularly favoured one, and the mean temperature for November is 47.5 degrees, for December 44.4 degrees, for January 43.2 degrees, for February 43.5 degrees, for March 43.9 degrees, and for April 47.4 degrees. These temperatures are the means taken over a period of twenty-nine years.

This equability of climate, especially during the winter season, is accounted for also by the action of the Gulf Stream. The sea round Cornwall is rarely below 46 degrees at the surface, even quite close to land, while some distance out the temperature is distinctly higher. Not only is the winter mean temperature very steady, but the range of temperature during that period is very small, i.e., about 4.3 degrees. These facts at once explain how it is that dracænas, palms, camellias, Himalayan rhododendrons, and even bananas flourish year after year out of doors unprotected.

Not so very long ago Lord Rosebery said, "Falmouth, preserve your beauty, for you will need it in the days to come, for the visitors who will throng to you." That advice is still needed, because in the matter of public gardens there is room for a great deal of improvement.

In natural beauty the Falmouth district is rich, especially round the harbour and for some distance up the River Fal. Many of the neighbouring private gardens adorn these beauty spots, and lend additional charm to a country where "the climate is that of the lotus-eaters."

Tremough.

Tremough, the first of the series of famous Cornish gardens to which attention is now drawn, is the property of D. H. Shilson, Esq., but the white mansion is now occupied by Colonel Brown. The entrance to the gardens is not far from Penryn Station, and as soon as one steps inside the gate the fact that rhododendrons are a leading feature is at once apparent. On either side of the broad drive that climbs slowly to the mansion are splendid examples of Rhododendron arboreum and other choice kinds, and one looks in vain for ponticum and other hardy sorts, such as grace the gardens in counties further north.

Tremough is a veritable home of the beautiful Himalayan rhododendrons. Not only do they thrive amazingly and flower profusely here, but they are made here—that is to say, Mr. Shilson and his late father, who was the pioneer of rhododendron culture in Cornwall, and Mr. R. Gill, who has so long had charge of the gardens, have ever been keenly interested in the hybridisation and cross-fertilisation of these beautiful plants, and have been particularly successful in raising new and beautiful ones.

Some distance up the drive the roadway is skirted with splendid masses of R. ciliatum, and in early spring these are smothered with their white flowers; they form compact specimens and make a capital foreground for the taller kinds. One of the larger specimens measures 18ft. through. Close to the house a long row of this beautiful rhododendron is used to form an edging to a huge bank of large Indian azaleas; in this case, the plants are smaller than those along the drive, but they are none the less beautiful.

After allowing ample room for carriages to reach the front door of the house, the drive continues through the gardens and estate. A little beyond the house the drive has been cut through the higher ground, and this has necessitated a retaining wall. This wall is surmounted by ornamental stonework, but it is all but hidden by the luxuriant growth of the fine camellias planted at its base. In early April these shrubs are gay with thousands of blooms.

Of formal gardening there is very little at Tremough. There are a few beds on the lawn, and these are kept bright with daffodils or begonias, according to the season. But the most interesting plants in this little flower garden are the big-branched examples of Dracæna indivisa in the several beds.

Coming again to the ever-present rhododendrons it is found that so numerous are the species, so remarkably varied their form and colouring, and so very fine the specimens, that there is considerable difficulty in knowing just where to begin or conclude any reference to them. As already stated, they skirt the long drive, they also fill huge beds and borders, and they clothe the margin of the thin woodlands that come down to the gardens on nearly every side.

The illustrations show something of the stateliness and wondrous beauty of the Tremough rhododendrons, and convey a little of the surprise they give to anyone familiar only with such plants in a big conservatory, winter garden, or the Temperate House at Kew. In one view Mr. Gill is standing by the side of a splendid R. arboreum about 20ft. high, and behind him is a densely flowered bush of R. ciliatum. Another picture shows a still larger tree, of R. arboreum roseum. This occupies a position close to the azalea bank, on the high ground above the camellia border, and part of it hangs gracefully over an old yew hedge. It must carry more than a thousand trusses of rosy blooms in its best seasons.

Not far from this spot the handsome R. Falconeri is found in a setting of R. arboreum varieties. This Sikkim species has enormous globular trusses of white flowers, admirably set off by the large, leathery, glossy-green leaves that are covered on the under surface with dense red-brown down. R. Thomsoni is perfectly lovely as I saw it, covered with neat trusses of blood-red flowers; it has smaller leaves, and is of lowlier growth than most others. Of R. campylocarpum, a yellow-flowered species, there is a fine example. R. barbatum is well represented, and R. arboreum varieties and seedlings are among the commonest plants in the garden. R. campanulatum and R. grande, two large-flowered species that are somewhat rare in more northern gardens, do well here.

A SPLENDID RHODODENDRON ARBOREUM ROSEUM AT TREMOUGH.

Among the hybrids there are some exquisitely beautiful things, and the chief of these are the glorious R. Shilsoni, the lovely rich pink Mrs. Henry Shilson, and the newer R. Duchess of Cornwall, and R. Gill's Triumph. R. Aucklandi, another species that is a success here, and gives the largest flowers of any member of the genus, has been used as a parent for many of Mr. Gill's seedlings, as is evidenced by the bold flowers and trusses so many of them possess.

The soil in which these rhododendrons thrive appears to consist of decomposed granite and leaf-mould, but soil and climate both suit them splendidly, and also agrees wonderfully well with the brilliant Embothrium coccineum, with the handsome Benthamia fragifera, with Andromeda formosa, with Clianthus puniceus—that flowers grandly against a wall, but is not otherwise protected, and with many other rare and choice plants.

At one end of the garden Mr. Gill has established a nursery, and here he has large breadths of many of these choice rhododendrons, lots of seedlings of Embothrium coccineum, and smaller plots of R. Falconeri, R. Shilsoni, R. Duchess of Cornwall, and R. arboreum varieties. Here, too, he has a home-raised stock of Dicksonia antarctica, seedling bamboos, a big batch of Lilium sulphureum, and scores of the fragrant Daphne indica. There are any number of other interesting plants at Tremough, including half a dozen strong seedlings resulting from the intercrossing of Rhododendron Falconeri and R. Nuttalli, all as yet unflowered, but these must suffice for the present.

Trelissick.

Trelissick, being translated, means The Dwelling on the Broad Creek. It is beautiful for situation, commanding delightful views over the River Fal, the broad Carrik Roads, and out to sea beyond Pendennis Point.

Trelissick has undergone a good deal of alteration and improvement of late, since G. J. Cookson, Esq., came to reside there. The estate is of considerable size, and the house is placed on the highest point of a ridge that slopes gently seawards, but very sharply on either side. This peculiar conformation of the ground has been taken advantage of, and one valley has been converted into a water garden. Here is a series of pools gradually descending from the head of the valley to the large lake down close to one of those broad creeks for which the estuary of the Fal is famous.

Around these upper pools are irises in great variety, and here and there where the land juts into the water bold clumps of gunneras luxuriate, their enormous leaves producing a wonderfully fine effect. Primula japonica is another subject that thrives around these upper pools. The slopes of this valley are well wooded, but near the pools rhododendrons are grouped, and various acacias give a wealth of fragrant blossoms in the spring time.

Probably, to anyone coming from less favoured counties, the chief interest of Trelissick would lie in the large lake at the bottom of the valley. A wide path runs along the top of the cliff that separates the lake from the creek, but from this path, during late spring and early summer, is seen one of the most wonderful sights to be found in English gardens. In the water, but near the bank, are masses of arum lilies, these extending right round the curved end of the lake. The plants are in perfect health, and in their season give thousands of beautiful white spathes. Of course, no protection is afforded at any time, in fact, beyond the occasional replanting of some part of the stock, this wonderful mass of arum lilies needs no attention.

In most places, the woodlands come down too closely and solidly to the margin of the lake, and so rather spoil the garden effect of this part of the valley.

Passing over the hill from this valley of the pools one reaches another and very distinct part of the garden. Here rhododendrons abound and bamboos flourish. Further round still, and not far from the famous King Harry Passage, across which one has to go to reach such places as Phileigh, Veryan, and St. Just, there is a good collection of coniferous trees. Here, too, is an extensive herbaceous border, very formally planted, with spreading lawns in front, and beds of T. and H.T. roses.

Trelissick is a garden of great possibilities. Nature, with some little help from art, has made it a garden of beautiful views. Mr. Day, the young head gardener, says there is only one drawback, and that is the poorness of the soil in many parts. The kitchen and fruit gardens need very close attention. Fortunately, the genial climate and moist atmosphere of this part of the delectable Duchy, are ever ready to lend powerful aid to any efforts put forth by the cultivator.

Rosehill.

In Falmouth itself, and set well up on one of the many high points the town possesses, stands the verandah-fronted residence of Howard Fox, Esq. From one point of view, nothing in the outward appearance of Rosehill would lead a person to believe there was anything of unusual interest within the garden boundary. But that is a way many of these Cornish gardens have. And yet, from among the many gardens I have visited I cannot call to mind one, in England, that is so altogether un-English as that at Rosehill.

Trim flower beds, gay parterres, spick-and-span pathways, and all the "smartness," so common in many new gardens—for these things Rosehill cares not at all. An almost tropical luxuriance prevails in this sheltered garden, and it would seem that the chief difficulty Mr. Jenkin (who has long had charge of the garden) experiences is that of keeping things within reasonable limits, rather than that of encouraging them to grow.

Rosehill has been badly misnamed. It should have been called Cordyline Hill, Banana Grove, or Musa House. There are plenty of roses at Rosehill, but surely no visitor ever looks twice at them. The fine old plants of Cordyline australis, the abundance of bananas, the vigorous and graceful bamboos, and the giant Arundo Donax, these are the things one admires, and of which Mr. Fox is pardonably proud.

The accompanying scene, taken from the lower part of the garden and looking upwards towards the house, indicates the character of the place. The broad stretch of lawn is bordered on either side with thick-stemmed, much branched Cordylines or "Club Palms," alternating with groups of Trachycarpus excelsus, tree ferns, and bamboos, the whole making up a picture of the character one associates in idle moments with a "Chateau d'Espagne."

But when one has grown accustomed to these cordylines Mr. Fox leads the way to his fern-bordered Banana Walk, and when you have pinched yourself to discover whether you are in England or whether there are "wisions about," he calmly remarks that in 1906 five specimens of Musa japonica fruited here, and that the tender Musa ensete often stands the winter at Rosehill.

I shall not attempt a detailed description of the various parts of the Rosehill gardens, but, instead, draw attention to a few of the choicer plants they contain. Acacia longifolia and A. verticillata, A. cordata, A. dealbata, A. ovata, A. armata grow freely, and bloom profusely. By the end of the summer a giant Datura sanguinea spreads its branches and bears its trumpet-shaped flowers over a space 75ft. in circumference! Bamboos are splendid, and during the summer of 1906 a stout young culm of B. fastuosa was measured carefully, and it was found to grow five inches in length each day for a period of three weeks.

On a wall facing south-west the citron flourishes, and is hardly ever without fruits. Olearia Gunni is a fine plant, and Piptanthus nepalense that needs a warm wall in the London district here becomes a bushy tree. Asparagus deflexus and Semele androgyna need no protection, and both fruit out of doors.

The bold Senecio petasites and S. grandifolia grow strongly and come into flower in January, and only in very bad seasons are their floral displays at all damaged. The ferns, too, are worthy of special note. Nowhere have I seen a larger mass of Lomaria procera than at Rosehill. Woodwardia radicans is in grand condition close by the doorway of the house. Plenty of fronds 10ft. long are to be found in this fine group. Mr. Fox says that several degrees of frost will do Woodwardia radicans no harm, but ten degrees will cut it down to the ground.

Senecio brachychætus ripanda is a splendid shrub 8ft. high. Diosma ericoides (syn. Coleonema alba) has been in flower for the past two years. Coronilla glauca, some genistas and fuchsias are also never without flowers, summer and winter.

Another plant, usually accounted tender, and with this I must conclude, is Rhodochiton volubile; it is a robust hardy climber here, and some further indication of the mildness of the climate at Rosehill may be gathered from the fact that it starts into vigorous growth at the end of March.

Penjerrick.

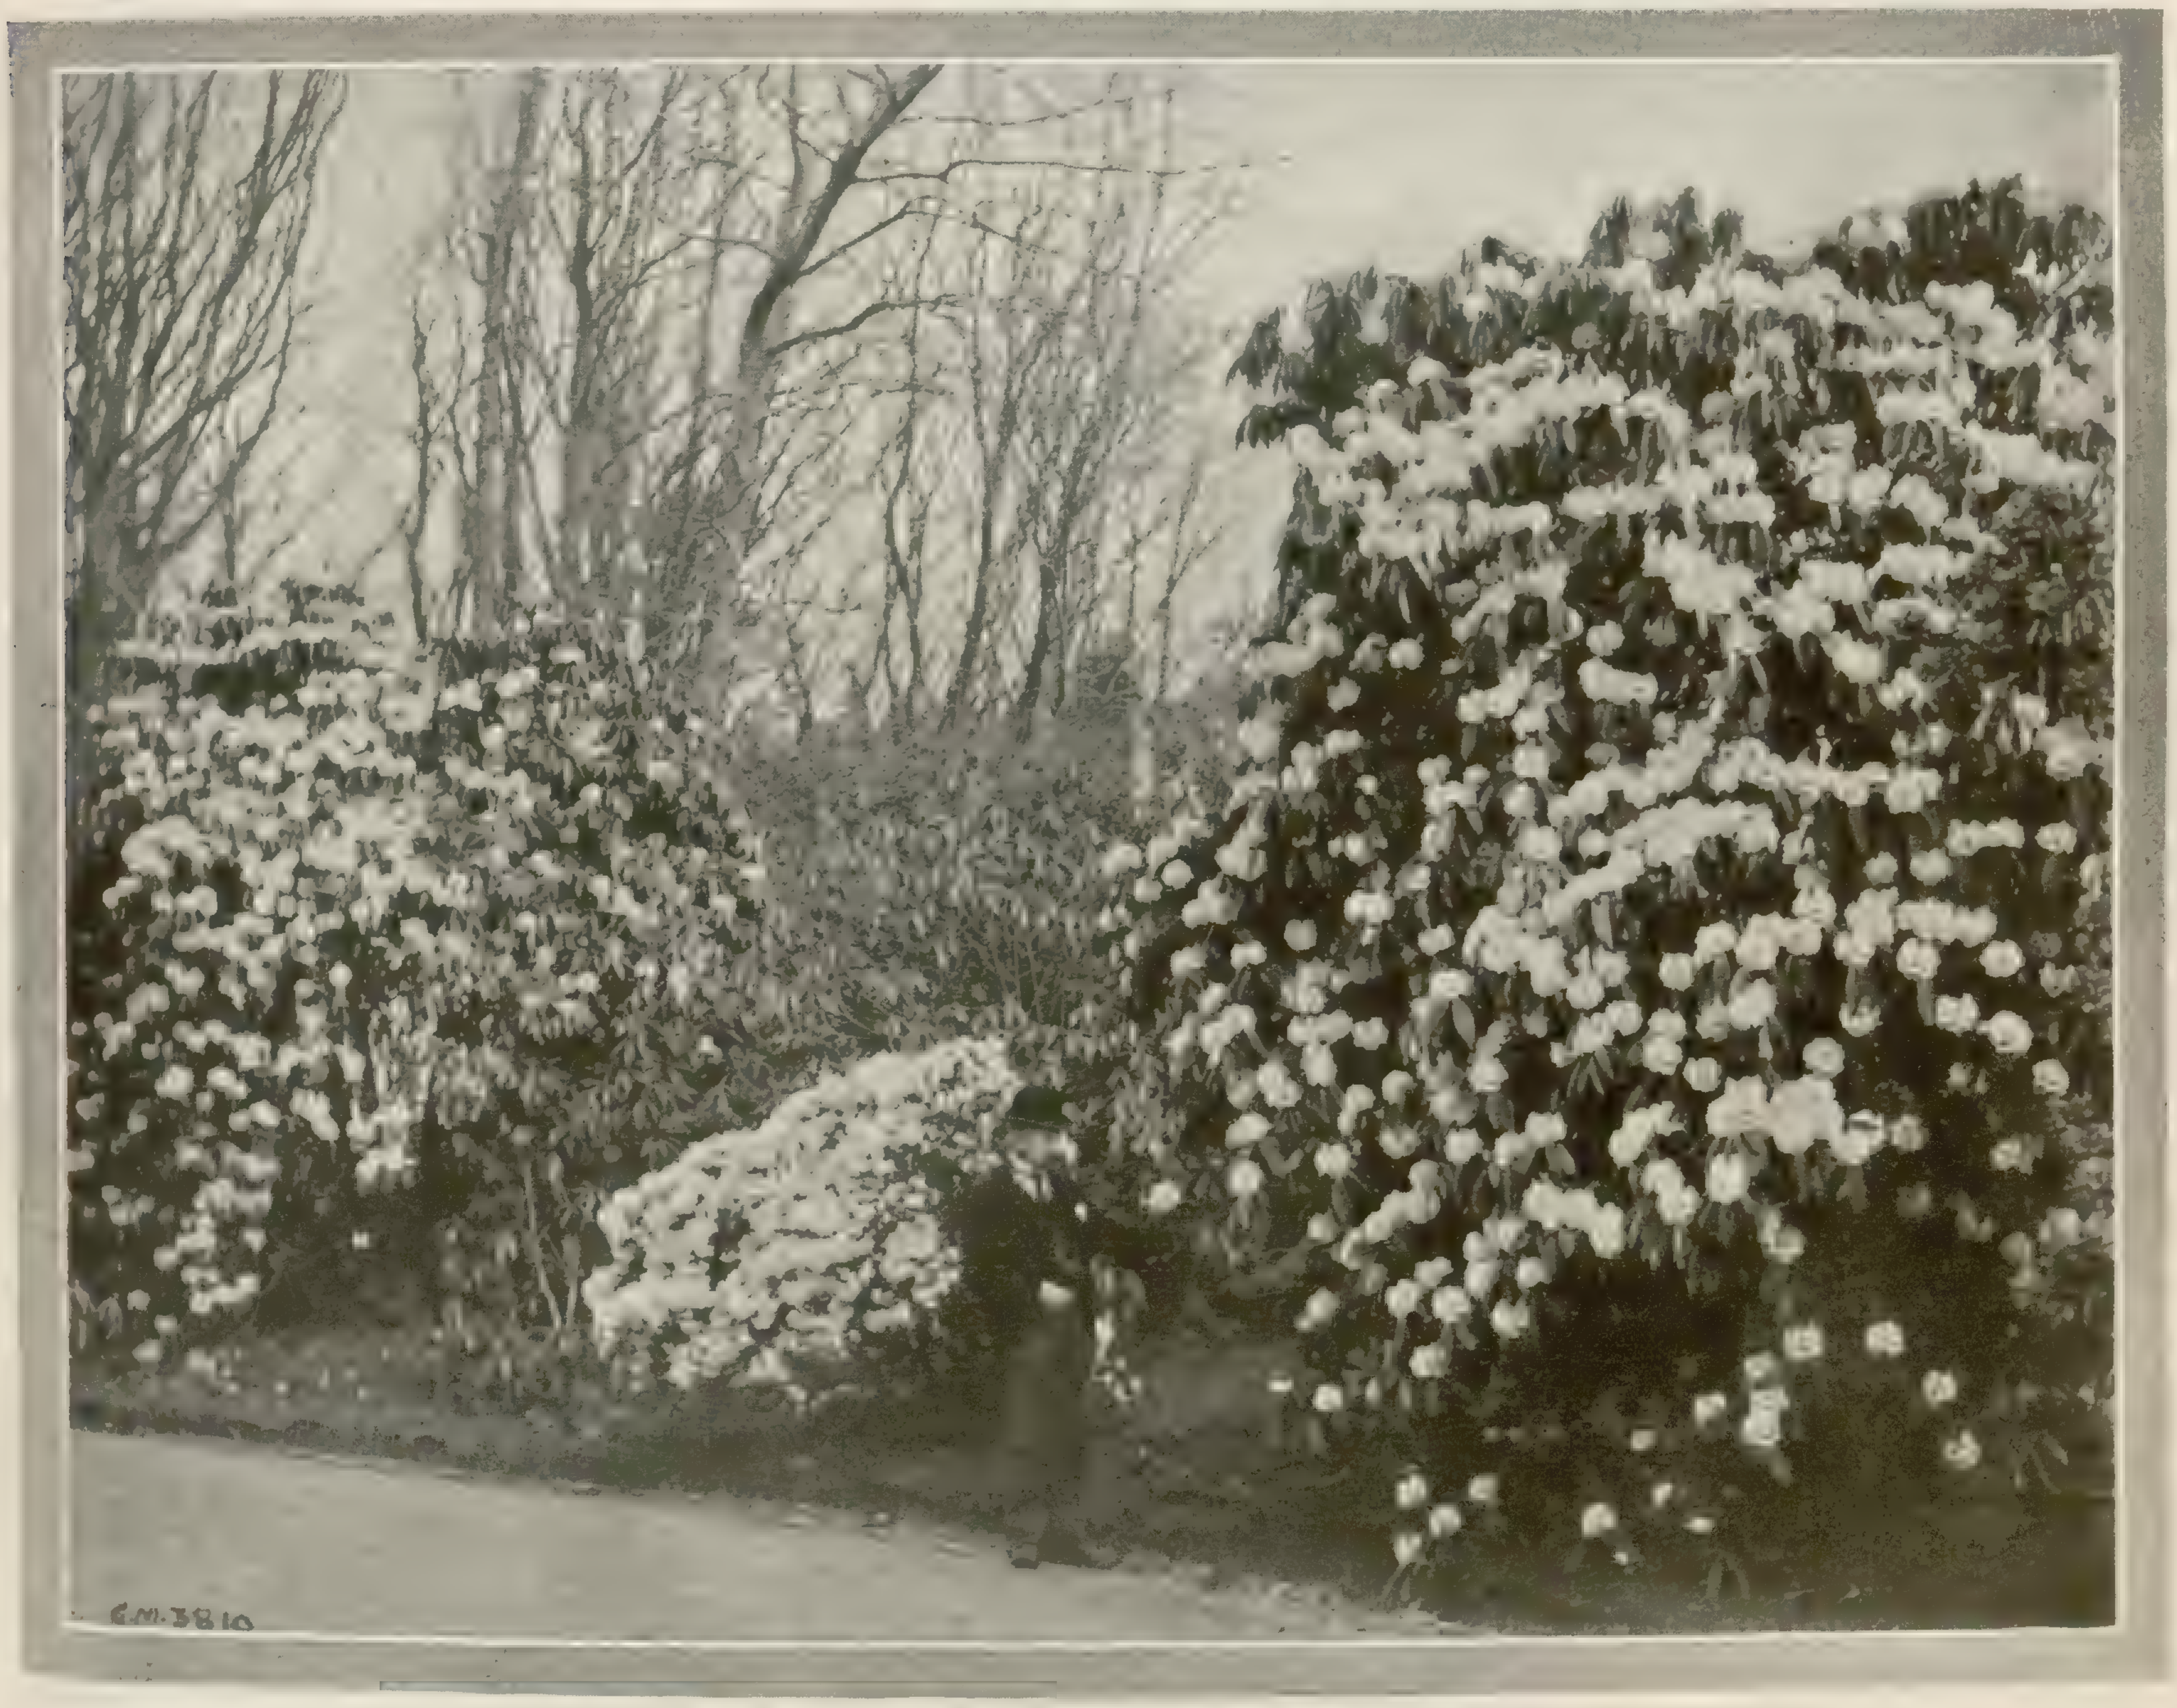
Camden has written:

> "By Tre, Ros, Pol, Lan, Caer, and Pen,
> You may know most Cornishmen."

The couplet would be equally as true if names of places rather than surnames were considered. These place names are of great interest because surnames were formerly taken from them; indeed, it is said that Cornish gentlemen of the eighteenth century, and earlier, not seldom changed their name when they changed their abode, using the name of the residence in each case.

Nearly all the names of the country residences have a meaning, and they are the remains of the Celtic language—Cymric, not Gaelic—once spoken over a considerable portion of the South of England. Penjerrick means "Head Rock."

Penjerrick, the residence of R. Fox, Esq., stands on a rocky eminence, at the head of a small valley that has been carved, wedge fashion, out of the hill side. The spot is a most picturesque one, and the wooded slopes give the garden ample protection, thereby increasing the favourable conditions of the locality. Here, as in most of the Cornish gardens visited, there is an utter absence of formality in design or planning. Fine rhododendrons abound, and stately conifers, big araucarias, and ancient dracænas raise their heads in all directions, showing by their colour and size how admirably the moist and mild climate suits them.



GROUP OF RARE HIMALAYAN RHODODENDRONS AT TREMOUGH.

Everyone familiar with the Crystal Palace will remember how, close to the great clock, there are some large examples of the giant asparagus, Semele androgyna. This robust climber covers a very large portion of the house front at Penjerrick, throwing up immense new growths every year, and fruiting and seeding freely on a south-eastern exposure; and yet this plant is a native of the Canary Islands. The Cydonia clambers over the porch, and in early spring is a blaze of brilliant scarlet flowers.

BANANA GROVE AT ROSEHILL.

The glass department is not extensive, but the whole of it is contiguous to the house. The most interesting part of it is a sunken, heavily-shaded fernery, where the ferns are prettily grouped in a very natural rock garden. Those exquisite gems of the fern world, the todeas and hymenophyllums, are perfectly at home in this moist indoor fernery, where, thanks to a kindly climate, they can dispense with artificial heat.

In the foreground of the charming scene that spreads out in front of Penjerrick, the several forms of the glorious Rhododendron arboreum at once attract attention early in the year, as they are clothed from head to foot in showy blossoms. Between these trees—for they are trees—one espies the noble frondage of that splendid Antipodean fern, Alsophila dealbata, and near by is the sweet Genista fragrans, a wealth of gold.

Along this upper portion of the garden are also some fine Yulans (Magnolia conspicua), and such grand rhododendrons as R. Pink Pearl, R. Falconeri, R. Nuttalli, and the magnificent R. Glory of Penjerrick. Indian azaleas are splendid at Penjerrick, great masses of them growing freely in this favoured spot and flowering profusely in early summer, while mollis azaleas are commonplace shrubs, but beautiful withal. All about here, among the trees, and also in other parts of the garden beneath trees, the handsome little Cyclamen hederæfolium seems to run riot, and its foliage alone makes it one of the most effective of lowly plants, and yet it refuses to grow in not a few gardens.

Among the interesting coniferous trees I was especially attracted by Fitzroya patagonica, a plant that is sometimes met with in large winter gardens, but here it is in fine condition out of doors. Here, too, is Sequoia sempervirens, 70ft. high, and with a trunk 16ft. round at about 5ft. from the ground; Cryptomeria japonica is 60ft. high, and Thuia gigantea rises to about 100ft., for some nine years ago, when carefully measured, it was 90ft. high. Cupressus Lawsonianus is very fine, and Pinus Montezumæ is unusually good. Some huge junipers are to be seen at the end of the terrace walk, and there is a handsome example of Podocarpus andina, as well as a particularly graceful specimen of Cedrus atlantica pendula glauca.

In the lower parts of the garden, by the water, the banks are clothed with rhododendrons, while by the water's margin Primula japonica is the commonest plant. Huge gunneras occupy prominent positions in this glen, but bamboos abound, and Phormium tenax is far finer here than in the Scillies. The water is not allowed to flow through and out of the glen in its own sweet way, but is held back in a series of pools, a method, by-the-way, that is not uncommon in these Cornish gardens.

But limits of space are inexorable, and so one can but mention a Laurus camphora 30ft. high, with yellow flowers, and fruits not unlike a marrow-fat pea; Boronia megastigma, that produces its deliciously fragrant blossoms out of doors; a great big unprotected Acacia dealbata, a tall Araucaria braziliana, the big groups of hydrangeas, Francoa ramosa, that flourishes in the herbaceous border; and ask how it came about that Mr. S. Smith, the gardener, had a sturdy plant of Primula Kewense come up among seedlings of P. japonica, two years ago?

And yet another word, and it is this: Mr. Fox opens this garden of Penjerrick to the public on Wednesday and Friday afternoons. Truly Cornwall has now, as a hundred years ago, "noble, free gentlemen," as well as men who are "sturdy, bold, honest, and sagacious," while even a wandering horticulturist quickly discovers it has "women lovely and modest, courteous, and unaffected."

Charles H. Curtis.

⁂ The second of the two articles on "Some Cornish Gardens" will appear in our next issue (March 14).

VIEW IN THE GARDENS AT ROSEHILL.

SWEET PEAS FOR EXHIBITION.

The subject of sweet pea cultivation is now exercising the minds of all those interested in these beautiful flowers, especially so in the case of exhibitors, so the following notes may not be without interest. My only excuse for writing is that I have been fairly successful in growing sweet peas.

One of the greatest factors towards successful cultivation of the sweet pea is the preparation of the ground, and this must be thought about long in advance of the time for sowing or planting out, which ever system has been decided upon, and at the outset I must say that I have quite come to the conclusion that for really high-class exhibition flowers autumn sowing in pots is far the best practice, though February-sown plants (also in pots) are very good.

Autumn and Spring Sowing.

Last year I found that plants from seed sown in pots early in October, 1906, wintered in a cold frame, and planted out early in April, gave me flowers of better size, substance, and colour, and continued blooming longer than those sown in February and treated similarly. The date of blooming of the autumn-sown plants was only a very few days in advance of the spring-sown ones. I should not like it to be inferred from this that I would rely entirely on the autumn-sown plants for exhibition purposes as late as July 24, the date of the National Sweet Pea Society's show this year, as I have generally found in this neighbourhood (twenty miles south of London), that plants sown as above are about at their best from July 1 to 10. Of course, three weeks after that, no matter what attention and care is given them, the flowers would have deteriorated somewhat, especially in the length of stem. I think the second week in March is quite late enough to sow for exhibition, and even then the plants do not prove so robust as the earlier sown ones. But the date of sowing must at all times be governed somewhat by the locality and the date at which the best exhibition flowers are required.

Preparing the Soil.

The times of sowing having been referred to, it is only here necessary to say that the seeds should be sown thinly in 48-sized or 32-sized pots, in a fairly light compost, afterwards placing the pots in a cool frame or on a shelf in a cool greenhouse, where they can have all the air possible on fine days; personally, I prefer a cold frame, as the lights may then be removed on all favourable occasions after the seedlings are up, and it is only in very frosty and wet weather that they need covering. But precautions must be taken against the attacks of birds, mice, and slugs.

Returning to the preparation of the ground: good deep trenching is absolutely necessary, though on some soils, owing to the nature of the subsoil, bastard trenching might do instead, but whenever possible it should be trenched three spits deep, and whether it is done in the autumn or early spring must be decided by the individual. I find in our cold, heavy soil that it is not advisable to trench too early, as a continuance of heavy rains consolidates the soil too much, so usually I leave the work until early spring. During the process of trenching plenty of strong farmyard manure should be worked in with the bottom and second spits, and if it can be obtained, blood and offal from the slaughter house can be thrown over it with advantage. Lime, soot, or bonemeal added to the soil will give very beneficial results. After trenching, if the soil is heavy, a good plan is to ridge it, as this allows the frost and air to have full play upon a good depth of soil, and the latter will be found to break down nicely and finely at the time of planting or sowing, and the young plants will grow away freely in it.

Planting and Staking.

The pots may remain in the frame until the time for planting out, and this operation should be done from the third week in March to the middle of April, according to the state of the ground, and as long as this is in a fairly dry condition, and the plants have not been coddled, the effects of frost need not be feared. Previous to planting the ground should be well forked over, and a sprinkling of superphosphate of lime be well worked in. Plant either in clumps or short rows, and leave the individual plants from nine to eighteen inches apart in double rows. I prefer planting in rows, as these are more convenient for shading in the event of hot weather, and the little shade one row gives the other is quite beneficial. After planting the rows should be carefully staked with some small twigs—old birch brooms I find very handy for the purpose. Soot must be used regularly to ward off the ravages of slugs, and it is quite advisable to cover the whole patch over with a garden net, which not only prevents attacks by greenfinches, etc., but helps to break the cold winds somewhat.

After planting and early staking there will not be much to do for some time, but as soon as the plants have made sufficient headway they will require to be permanently staked. Use good strong hazel stakes, making them very firm in the ground, and inclining them, if anything, a little outwards at the top, as this gives them a little more resistance to the wind, and the haulm is less likely to fall about. Also at about this time the plants will be making a good many shoots at the base, and these should be thinned out somewhat, and a tie given here and there where necessary, just to give them a hold until they throw out their clinging tendrils.

DRACÆNA WALK AT ROSEHILL.

Mulching, Shading, Etc.

After staking it is necessary to break up the soil between the rows or clumps, and to keep this well hoed at intervals up to the time the flowers commence opening, and at this time, if the weather is hot and dry, a good syringing overhead each evening will do good. A mulching of good fresh farmyard manure might also be given, especially if the soil is light, but if the ground is heavy and has been well manured, and the hoe kept going, this is not really essential; indeed, I think a good deal of the bud dropping that we hear about is caused by heavy mulching, and watering just previous to the flowers opening.

After the plants have got well into their flowering stage a little feeding is necessary, giving weak doses of farmyard liquid, and alternating these with an application of some good artificial manure, such as Clay's Fertiliser, nitrate of soda, or nitrate of potash, but always giving it directly after a good soaking with clear water. It is wise not to let sweet peas become really dry.

Shading will no doubt have to be provided to preserve or bring out the colour in some varieties, such as Henry Eckford, Helen Lewis, and a few others, but this only needs to be done three or four days before a show, and my practice is to cut all open flowers six or seven days previous to a show, and as the blooms get fairly well expanded shade them with very light tiffany, or, in most cases, with a double thickness of fish netting. This should be removed as soon as the flowers are gathered, because leaving it in position weakens the plants considerably.

Cutting and Staging.

When cutting for exhibition care must be taken to secure quite young and unmarked flowers, never cutting them when wet with dew or rain, though it may happen that one is obliged to do this sometimes; if so the best plan is to cut the flowers as carefully as possible, place each bunch separately in water, and leave them in a shed for a few hours where the air can get to them. They most certainly must not be packed until quite dry.

When arranging the blooms in vases aim at obtaining a light effect by giving each individual flower plenty of room, and make as much as you can of long stems, as at the present time in sweet pea exhibiting even good growers cannot afford to give away points, for the competition grows keener each season. When arranging the vases on the table place those colours near together that produce the best and most pleasing contrasts, never letting any one colour predominate at any one point in the exhibit. Label correctly and legibly.

Varieties are unlimited, and everyone has favourites, but from the following I am sure a good dozen could be selected: **King Edward, Queen Alexandra, Nora Unwin, Paradise, Mrs. Hardcastle Sykes, Lord Nelson, Lady Cooper, John Ingman, Black Knight, Henry Eckford, James Grieve, The Marquis, Evelyn Hemus, Rosie Adams, Helen Lewis, Helen Pierce, Jeannie Gordon, and Sutton's Queen.**

F. Stevenson.

Woburn Place Gardens.

CALANTHES.

There is undoubtedly much to learn yet in the art and craft of gardening, for, as Shakespeare said, "This is an art which does mend Nature, change it rather, but the art itself is Nature."

When describing the cultivation of a certain class of plants one is apt to forget the important part that Nature teaches us. The observant eye is not slow to detect the difference between the growth of plants in the well-watered fertile plains, and those on the poor upland moors, or between the crops that are produced on a well-cultivated farm, and those that are grown on poverty-stricken, ill-tilled land. It is the same with plants grown under glass. Where ample food of a suitable kind is provided, a genial temperature, regular supplies of moisture, and other things needful to their well being, there is but little doubt that what are considered difficult subjects will readily respond to the treatment.

Deciduous calanthes are, for the most part, hybrids, therefore they have no natural history to guide us in their cultivation. In the first place, we have to find out the soil most suitable for them to root in, the temperature most congenial to their well being, and a structure where this can be maintained. Soil is the first consideration, but the best material procurable may be spoiled in preparation, therefore a little explanation as to the mode to follow may be of service to those who contemplate making a start in the cultivation of these most useful winter-flowering subjects.

We are apt to advise people to take good turfy or fibrous loam, or this and the other material, but I may say at the outset that our loam is decidedly poor, but we make the best we can of it, and this is the way we manage. The sods, which are cut in the autumn, are stacked in a heap until the spring; they are then pulled to pieces, preserving what little fibre there is in them; most of the fine soil gets knocked out in the operation, and the fibrous portion only is used, and this is mixed with dried cow manure in equal proportions. Sufficient broken potsherds are added to keep the whole porous. This mixture is put into a heap in a warm place for a few days previous to use. By many this may be considered a light compost, but I may say that our soil is bordering on clay, so I will leave the reader to judge for himself of its nature. This then is the material we use for Calanthe Veitchi, C. bella, C. superba, C. rosea, C. Turneri, and that most beautiful of all calanthes, C. Harrisi.

As soon as the flower spikes are cut the bulbs are taken from the soil, and every particle of the old root is removed close up to the base. The bulbs are then stood in shallow boxes until the young growths appear. At no time are they subjected to a lower temperature than 55 degrees, as a low temperature, even when the bulbs are in a dormant state, is one of the chief causes of spot in the subsequent foliage. While in the boxes the bulbs should be examined frequently to make sure that none of the young growths are injured, and they should be turned round occasionally, so that they may have all the light and air possible.

In the matter of potting I believe our method differs from that of most people, and herein lies the secret of our success. We do not use pots for the large bulbs; these are either planted in baskets eighteen inches in diameter, or in pans specially made for the purpose. These latter are from twelve to fifteen inches in diameter, and about nine or ten inches deep. When the former are used a layer of moss is placed round the inside to prevent the soil from running through the meshes; the baskets are then filled with soil as loosely as possible, not pressed together in the least. If pans are used then these are moderately drained and filled with compost in like manner, but heaped up so as to form a cone. Bulbs of even size are then selected, having the young growths as evenly developed as possible. Five of the largest are chosen for a pan, and having placed one on the top of the cone this is secured in position by having two sticks thrust into the soil, one on either side of it, and a piece of raffia is then tied round to make the whole firm; by this means the bulbs are held in position through the summer. Four other bulbs are then placed at equal distances apart round this, about halfway between the centre and the rim of the pan, and these are secured in like manner. The pans are then stood in a melon house, where they remain until growth is completed. Very little water is needed at first, that from the syringe, which is used twice daily over the melons, being all that is required. We have no special time for potting the plants, but simply place them in the pans when the young growths are about an inch long, and before new roots have very much advanced.

Buxted Park Gardens.

(To be continued.)

CUCUMBERS IN ABUNDANCE.

Owing principally to the cheap methods of erecting glass structures, combined with a great improvement in the varieties and a better knowledge of their requirements, the cultivation of cucumbers during the spring, summer, and autumn is now practised in nearly every garden of any dimensions. They also form one of our greatest market gardening industries. People talk of tons of cucumbers nowadays as we used to speak of dozens a few years ago. This is, of course, a great boon to those who live in populous centres, for without the aid of the market grower they would be unable to obtain supplies.

Cultivation in Houses.

It is not at all necessary to have specially-built structures for the growth of cucumbers during the summer and the early part of the autumn. Almost any house provided with a hot-water apparatus for maintaining a reasonable amount of artificial heat, and commanding a full amount of sunheat will suffice. Except during the hottest part of the summer it is absolutely necessary to raise the plants in heat. The seed should be sown singly in small sixty pots, water the seeds in, but keep them moderately dry till after germination has taken place. Immediately the third leaf is made shift them into 32-sized pots, grow them on with the same temperature, and near the glass. Use every precaution to build up a stout, short-jointed growth, as weakly plants seldom give really satisfactory results.

While the plants are being nursed along the house in which they are to be fruited should be prepared for them. Make everything perfectly clean, and the walls, if there are any, should be limewhited. It is always well to arrange for a certain amount of fermenting material, and a bed from two to three feet thick will be ample, and there is nothing better than good oak leaves. A small quantity only of soil is required, and this should consist of good fibrous loam, a little sandy material from the roadside, and leaf-soil. Allow the soil to become nicely warmed before turning out the plants. Neatly stake and arrange for the growths to be trained to a wire trellis fixed about one foot from the glass. Allow a distance between the plants of about two feet. Endeavour to maintain a temperature of from 60 to 80 degrees, and during very hot weather no harm will be done if the thermometer rises over 100 degrees. The paths and stages should be continually damped down, and a moist atmosphere maintained, when the growth will be rapid, and in four or five weeks good fruits may be looked for.

Constant attention will be necessary in the matter of stopping and training. Carefully avoid overcropping, especially in the early stages, allowing a moderate crop only of the most shapely fruits. Do not allow any fruits to remain after they have become fit for use, as it is when the fruits begin to mature that they naturally impose a heavy strain on the plants. Add slight top-dressings from time to time as the roots push through, and give assistance by applying liquid manure when the plants are in full bearing. Do not syringe the growths after fruiting commences, but damp down the paths with farmyard liquid manure during the early part of the evening. On no account must the roots suffer from dryness of the soil, or the fruits are certain to be bitter. At all times apply this in a tepid condition.

Edwin Beckett, V.M.H.

Aldenham Gardens, Elstree.

A GARDEN OF ANNUALS.

Such a wealth of material for the adornment of our gardens as is provided for us to-day by the great and ever-increasing class of annuals was never dreamed of by our forefathers, though, before the introduction of the bedding pelargonium, and the subsequent bedding-out craze, they gave a good deal more attention to annuals than we do now. Adaptable to such diverse purposes are the members of this great class of garden plants that it is quite possible for a man going to live in a new house in the autumn, with only a piece of field for a garden, to have as gorgeous and varied a display the following summer as if he had been there for years.

Among annuals there are plants of every colour and of every conceivable habit of growth, from giant sunflowers to trailing plants, and when making out one's seed order one can arrange to have a garden at its brightest at that time of the summer when one is going to see most of it, except that in June, unless we have been able to follow Nature, and let our hardy annuals be autumn-sown, there are not many annuals from which we can expect much display before the latter part of the month. The same applies, however, in some degree, to many of what are generally known as bedding-out plants. The types, or classes, of annuals being of so varied a character, and the purposes to which they may be put so diverse, it will be as well to simplify the subject by grouping them together according as they more especially lend themselves to different parts of the garden scheme, premising that for the purposes of this article we will regard as annuals any plants which can be flowered the same year as they are sown, even though they may last more than one year if desired, or the necessary trouble taken to preserve them.

Let us deal first of all with those which are more especially adapted for use as

Bedding Plants,

such as stocks, asters, French and African marigolds, zinnias, petunias, pentstemons, verbenas, balsams, lobelias, Salvia patens, ageratum, Phlox Drummondi, salpiglossis, nicotiana, Dianthus Heddewigi, and others more or less suitable for this purpose. Nearly all annuals that are worth growing need good cultivation, none of those just mentioned being an exception, and fortunately plants in beds generally get it as far as soil goes, owing to the digging and manuring which such beds usually receive every year.

The next point, if they are to occupy the most important places in the garden, is that we should get them in flower as early in the summer as possible, say, by midsummer. Nearly all of those mentioned are only half-hardy, and consequently need to be sown in gentle heat not later than February, the middle of the month being better than the end, and brought on in the usual way, so that they are sturdy plants, ready to plant out with a good ball of earth attached, or even as single pot plants, by the end of May.

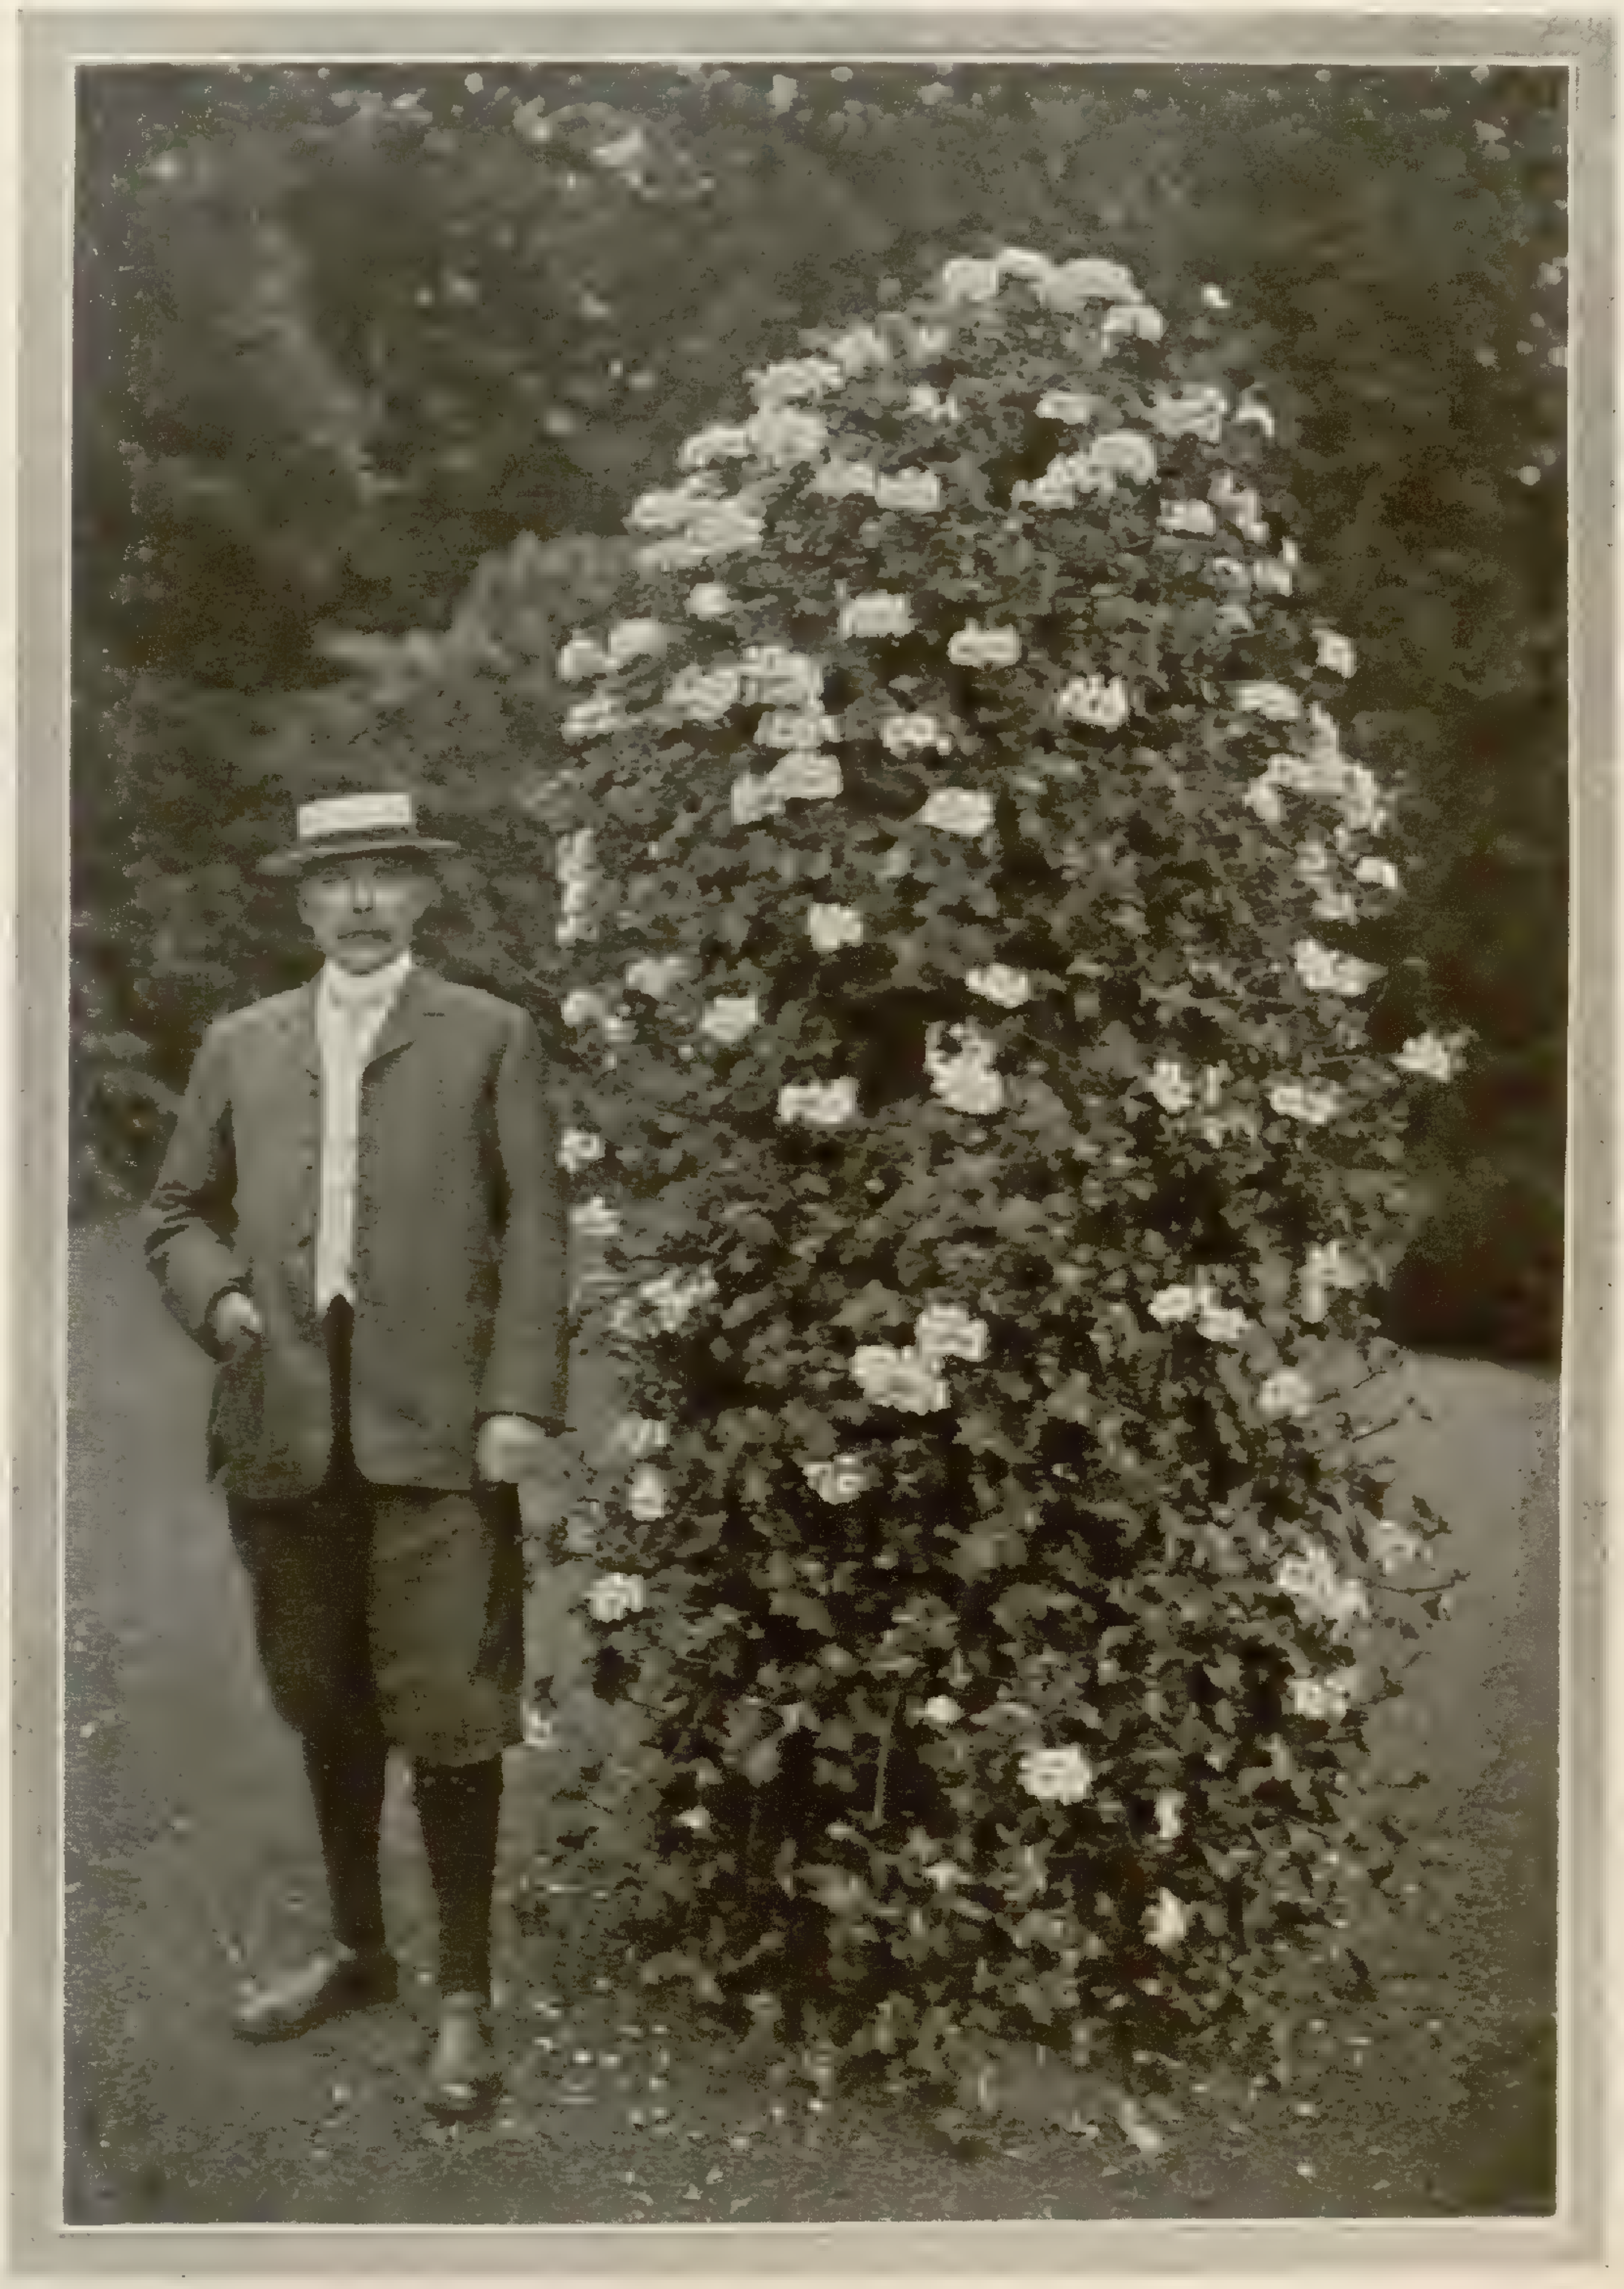
The complaint that annuals are of short duration applies to scarcely any of these, for most of them begin to flower by the second or third week in June, and continue to make a good show in a favourable season till late in September. Few things make a more beautiful bed than petunias [illegible] pegged down evenly all over it. The same applies to Phlox Drummondi, though these are more difficult to succeed with.

A. PETTS.

(To be continued.)

IVY-LEAVED PELARGONIUMS AT POOLE HALL, CHESHIRE.

Among the many things that are well grown by Mr. Forrest, head gardener to Sir William and Lady Holland, at Poole Hall, Nantwich, Cheshire, are ivy-leaved pelargoniums, and such exceptionally fine specimens has he produced of these that a note in the GARDENERS' MAGAZINE as to their size and effect may interest and stimulate some readers. It may be remarked that Mr. Forrest is an exceedingly keen and clever gardener, and if once he takes a subject in hand, neither interest or energy are lacking until he has attained results considerably beyond mediocrity.



A FINE IVY-LEAVED PELARGONIUM MADAME CROUSSE AT POOLE HALL.

In the case of ivy-leaved pelargoniums he had occasion to grow a few for corners of walks, and to break up the flatness of flower beds, etc., and these, during the summer of last year were very much commented upon by those who saw them. The finest specimen was 9ft. in height, and from 4ft. to 5ft. in diameter, and a picture of health and beauty from top to bottom. This was produced within eighteen months from the cutting, and the single specimen shown in the illustration, with Mr. Forrest standing by its side, will convey a fair idea of its proportions. On the east side of Poole Hall these ivy-leaved pelargoniums were employed to add colour to a portion of the lawn, and, at the same time, break up the stiffness of the surroundings.

These were propagated in the spring of 1906, grown on in pots, with liberal treatment as to food, until their roots demanded a wider sphere, when they were transferred to tubs. Strong bamboo stakes and wire were used to secure height and width, and the growths were trained to cover the tubs, so that when seen on the lawn they had the appearance of having been planted out. Only two varieties were used by Mr. Forrest, viz., Madame Crousse, a rather pale pink, and Souvenir de Charles Turner, a rich red-coloured variety, both of which are vigorous growers and free bloomers.

Although I have often advised others to employ ivy-leaved pelargoniums, and used them myself for such purposes as those at Poole Hall, yet my attainments, or those of my friends, have not in anyway approached the exceptional achievement of the chief of the Poole Hall Gardens. It is therefore a pleasure to record such results, as something to aim at for myself and others, and to draw attention to the fact that under thoroughly good management ivy-leaved pelargoniums may not only be used to break up the flatness of flower beds, but are also adaptable for covering pillars, fences, and even forming arches, as demonstrated by the rapid growth and well furnished plants at Poole Hall.

PEDESTRIAN

WINTER SPRAYING FRUIT TREES.

To many gardeners and fruit growers the operation of spraying the fruit trees is fully recognised as one of the most important items of fruit cultivation. Indeed, without spraying, it is almost an impossibility in many districts to produce some of the hardy fruits in the best condition and fit for the dessert table. Trees in a fruitful state will invariably produce a quantity of fruit, which may, and in most instances is, practically spoiled for either home use or for sale by one or other of the numerous enemies which are generally prevalent in gardens where fruit is much grown. Yet had a little labour been expended in spraying the trees, quite a different and much more satisfactory result would have been attained.

Another point, and this a most particular one, which should be well considered where apples and pears are required for use over as long a period of time as possible, is that clean and healthy fruits keep much better and give much more satisfaction than do those which have been attacked by insects or fungoid growth.

Summer versus Winter Spraying.

Insects and fungoid pests are much more in evidence during the summer months than at other times of the year; consequently spraying the trees with a weak emulsion is often practised, with the result, generally, that the foliage suffers more than the insects. Therefore we have to consider the best season to apply remedies for the destruction of the enemies, with the least possible danger to the trees.

My experience leads me to suggest that the season from October to April is the most suitable for this work, as during these months much more drastic measures may be adopted than would be possible at any other period of the year. The trees are without leaves the greater portion of that time, and there is nothing to prevent the emulsion from reaching to all parts of the branches and stems, and coming into direct contact with the pests. Many insects conceal themselves in the cracks and crevices of the bark, and in the axils of the buds, in which positions, if left alone, they pass through the winter months safely, notwithstanding the cold weather that may be experienced. The eggs of other pests are deposited on the branches of the trees, and generally in such positions as to be almost invisible, and, like the former, these seem impervious to the weather. As soon as the warm spring arrives, they hatch out, scatter themselves over the trees, and forthwith commence their work of destruction, and the large amount of mischief these minute objects can accomplish is almost inconceivable.

When to Spray.

The other points to consider are the best time to spray, and the most effective emulsion to use. The eggs of aphis are usually laid during the months of October and November, and it seems almost impossible to destroy them with an insecticide without damaging the trees. Efforts should therefore be directed towards combating this by destroying the egg-laying insects. This may be accomplished by a forcible spraying when the leaves commence to change colour and before they fall, using a rather strong solution of paraffin emulsion, and repeating the dose in the spring just before the buds begin to swell up, so as to kill any perfect insects which may have escaped the first application. This process will very greatly assist in keeping the pest in check. As most of the species of aphis protect themselves by curling up the foliage during the summer, it is then impossible to reach them with an insecticide, to that every opportunity should be taken for their destruction during the winter months.

Several caterpillars feed on the foliage of fruit trees, while others feed on the fruit. The last few seasons we have discarded grease banding for the winter moth, and depend entirely on spraying the trees just before the buds open, and again immediately after the fruit is set and the petals are falling, with an acetate of lead emulsion. This not only destroys the caterpillar of the winter moth, but also any other species that may be found on the trees. This emulsion is perfectly satisfactory, and we find it quite as effective, and much safer to use, than Paris green, as it is not so liable to scorch the young foliage as the latter.

Fungi, Moss, and Lichen.

Moss and lichen may also be classed among the injurious pests of the fruit garden, as they clothe the branches and stems in such a manner as to prevent air from reaching them, thereby hastening decay; they also provide ample security for many insect pests. Among the many remedies advised for the removal of moss and lichen we have found none so effective and so easily applied as the alkali wash, which quickly cleanses the trees, leaving the branches bright and clean; there is also no doubt that this is very destructive to numerous insects and their eggs.

Fungoid diseases, where prevalent, are very destructive, and should be kept in check by every means at one's disposal. We have a few apples and pear trees here which were at one time badly infected, but we have practically got rid of the disease by spraying the trees when dormant with a strong solution of Bordeaux mixture.

Summary.

To sum up these remarks, I would suggest that a spraying with paraffin emulsion be given to all fruit trees just previous to the fall of the leaf, and again before the buds start in the spring. The alkali wash may also be applied to all, but in a slightly weaker form on peaches and nectarines. For trees which have been infected with fungoid diseases the Bordeaux mixture may be applied at any time during the winter. For caterpillars give the acetate of lead wash as the buds begin to push forth in the spring, and again as soon as the fruit is set.

When spraying thoroughly wet the whole of the tree, using as fine a sprayer as possible, but do not spray when the branches are frozen.

The insecticides and fungicides I have mentioned can be obtained ready for use, but in case any would like to prepare their own I have added below the quantities. The mode of preparation has been so often described in these pages that it will be unnecessary for me to do so now.

Paraffin Emulsion.—Soft soap, two pounds; paraffin, one pint; rain water, ten gallons.

Alkali Wash.—Caustic soda, one pound; carbonate of potash, three-quarters of a pound; soft soap, one pound; rain water, ten gallons.

Bordeaux Mixture.—Two pounds of copper sulphate, two pounds of lime, and two pounds of treacle, to ten gallons of soft water.

Acetate of Lead Wash.—Three ounces of acetate of lead, one ounce of arsenate of soda, and two pounds of treacle, to ten gallons of water. Geo. Woodgate.

Rolleston Hall Gardens.

CARE OF GARDEN TOOLS.

One often wonders whether the numerous readers of the Gardeners' Magazine take into consideration the importance of keeping in order the various tools required in gardening operations. That these are both numerous and varied most people who have anything to do with such work must be aware, but of their number and kind very few who have not given the subject their consideration would have any idea. They range from the common dibber used in pricking out the smallest and most delicate seedlings, up to the latest motor lawn mower and the most approved and scientific instruments required for levelling and marking out ground.

All well-appointed gardens should have a tool house, fitted up with pegs and shelves on which tools may be hung or put away. There should be a place for everything, and everything should be kept in its place. Every man should have a separate set of such tools as spade, fork, rake, and hoe, and should be allotted a peg and place on which to hang or put his tools when not in use. He should be instructed to take them to their place each night, no matter in what part of the grounds he may be working. All bright tools should be cleaned and rubbed dry with a piece of cloth or canvas before being put away, and those not likely to be required again for some time should be oiled to prevent them from rusting.

Here the rule is to allow the men ten minutes or a quarter of an hour each evening to clean and put away their tools. Each man has his own set, and his allotted place, and he knows that if the tools are not in their place he will be called to account. By adopting this plan tools are brought to the shed and put away tidily.

Tools form a considerable item in the garden accounts, as some of them are costly, therefore, if they are not taken care of the expense is considerably increased. Nothing is more annoying than to find, when a certain tool is required for use, that it is either lost, broken, or is in such a state that it cannot be immediately used. It is far easier for men to work with clean bright tools than with those that are rusty.

Tools may be divided into three classes, such as blunt, sharp-edged, and machinery. If we take the former these include such articles as garden hose, brushes, sieves, baskets, wheelbarrows, and the like. Now if these are put away in the dry each time they are used, they will last longer than when allowed to remain out exposed to the weather. Sharp-edged tools include spades, billhooks, shears of various kinds, picks, knives, turfing irons, etc. All these should be cleaned and rubbed dry before being put away.

Of machinery the chief items are lawn mowers, sprayers, garden engines, rollers, and the like. Oh! that is only an iron roller, and will come to no harm if left out! But it should be remembered that the weather has considerable influence on iron, causing it to rust, and flake, therefore all parts that have any wear should be oiled before the roller is put away in the dry. It is no uncommon thing to see rollers left for months together close to where they were last used, but this is not taking care of one's employer's property. Lawn mowers are costly machines, even the smallest are expensive if not taken care of. They will soon become unusable. They ought to be cleaned each time they are used before being put away. And when the season for mowing is over, all the parts that are not painted should be thoroughly cleaned and oiled before being stored away.

H. C. P.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

EAST INDIAN ORCHIDS.—With the exception of one or two species, these fine orchids have practically dropped out of general cultivation. It is only in the older collections and botanical gardens that we meet with anything like a representation of these most beautiful subjects. I think this is to be regretted, for there are certainly included among them some of the most deserving, as well as the most beautiful plants in the orchid family.

VANDAS. — The large growing section, which includes the remarkable variations found in V. tricolor and the allied V. suavis, were for many years included in groups at the summer shows throughout the country, and most attractive subjects they proved. Even when not in flower, there are no orchids that give a more graceful effect. These plants will now be commencing to make new roots, and any repotting necessary should now be attended to. Where the plants have become leggy from loss of the lower leaves, and have ample aerial roots between the lower remaining leaves and the surface of the potting compost, such plants may be cut down. First carefully turn them out of their pots, the operator is then better enabled to see what length of the stem can be dispensed with; after the stem has been shortened to the desired length, a stick sufficiently strong should be secured to the stem, and, after carefully working the roots in the pot so that the stem may be in a desirable position, the pot should be filled to one-half its depth with drainage, carefully avoiding damage to the roots; the remaining space may then be filled in with chopped sphagnum moss, intermixed with broken crocks or peat. Plants that are in good condition should not be disturbed. The sphagnum moss and decayed material on or near the surface may be carefully removed, and fresh material given. The shorter-growing sections, such as V. Parishi, V. concolor, V. cristata, V. Roxburghi, V. Amesiana, and V. Kimballiana, are best grown in pans or baskets suspended near the roof-glass. These should also be attended to at the present season.

AERIDES are scarcely known to our younger orchid growers; these should also have received attention, being treated in the same manner as vandas. The dwarf-growing kinds, such as A. Fieldingi, A. maculosum, A. Lobbi, A. affine, etc., may be grown in baskets, and suspended near the roof-glass. The tall section should be grown in pots. The whole of the foregoing plants may be successfully cultivated in the ordinary plant stove, if a house cannot be set apart for them. All plants that have been repotted should be carefully shaded from the direct rays of the sun. A humid atmosphere should be maintained, and every encouragement be afforded. Syringing overhead, when the outside conditions permit, will prevent undue shriveiling of the leaves, and will aid root action.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

FUCHSIAS.—Plants that have been wintered in cold houses will now be breaking into growth, and it is a good plan to take from them a few stout shoots as cuttings, ere cutting back the old branches. When pruning is done in the early winter, and breaks are not so good in the spring, usually all the best shoots are then needed to furnish the plants. If any tops be taken off to make cuttings the shoots should have become at least six inches long, so that they have enough of base left to break afresh. Plants wintered in an unpruned state usually break freely from every leaf joint, so that there is abundance of shoots to select for cuttings, and then when the young branches are cut back the growth of the new shoots is stout and [illegible]. Fuchsias bear hard pruning remarkably well, but the roots like ample pot room and feeding, and as the fuchsias have again become popular for summer bedding, it is well to propagate liberally in the early spring, growing them somewhat freely. Pinching is needed to prevent flowering; indeed, keep the plants growing all the season so that fine ones, three to four feet high, are produced for the following summer.

NERTERA DEPRESSA. — When this interesting little plant is thickly set with its bright orange scarlet berries it is sure to attract attention. As the plant flowers early in the year, it is best increased by division at once, so as to encourage an early growth and a greater number of blossoms. These latter are of a greenish hue, and appear in the axils of the leaves. The plant grows freely in light sandy loam, mixed with fine brick rubble. When potting keep the plants on a level with the top of the pot, so that a mound-like form may result when growth ensues; give plenty of moisture overhead during the growing season. The nertera may be well grown in a cold frame, and in such I have wintered large numbers satisfactorily.

DOUBLE PETUNIAS. — These are extremely useful for a summer display in the greenhouse and conservatory, young vigorous plants keeping up a show over a very long season. It is quite a mistake to keep old plants, as is often done, as they are lanky and untidy in appearance if not cut back, while if so treated the flowers are never so fine as from young plants. Seeds may be sown now, but it is much the better plan to obtain a good variety and propagate by cuttings yearly, throwing the old plants away in autumn, after reserving a few for stock. These will be cut back and kept in the greenhouse during the winter. They will now be covered with short stubby shoots two inches or so in length, and it is now quite time to strike these. They strike with the utmost ease in light sandy compost, about five or six being placed in a 4-inch pot. The soil must be well watered at once, and kept moist; and the cuttings will be rooted in about a fortnight. Pinch the tips out of each one a few days in advance of putting them singly in small pots; after this repot by gradual stages, never allowing the plants to get pot-bound before shifting them, as this will cause flowers to be produced before growth has sufficiently advanced. Growth is rapid in a greenhouse or frame temperature. By the time the final pots are filled with roots they will be dense bushes about a foot high, and as much through, and for three or four months these plants will produce an almost unlimited supply of flowers for cutting or, if needed for this purpose, will be useful for the conservatory.—T. B. Field, Ashwellthorpe Gardens.

THE FLOWER GARDEN.

LAWNS.—Continue to sweep and roll lawns, and trim verges so as to insure good order and appearance. If possible, remove all strong plantains, dandelions, etc., rake over any mossy parts of lawns, and apply a good top-dressing of wood ashes, fine soil, and well-rotted manure, lightly rake in, and give a good rolling. Endeavour to bring all lawns into good condition, as patchy turf detracts from the appearance of the place.

SUBTROPICAL GARDENING. — Where this is practised, or tubs and plants are plunged in mounds on grass, positions may now be prepared in readiness for the summer. Dummy tubs may be placed in mounds, and turfed over until the summer occupants are brought out.

ROSES.—Protecting material should be very carefully removed, but where newly-planted and tender roses have been protected with leaves and mulching on the ground this may remain a week or two longer. A few of the most sheltered plants may now be pruned; the very weakest of the wood should be cut quite out, the moderate growths cut well back, and the strongest growths left somewhat longer. H.P.'s should be cut closer than teas and H.T.'s; China or monthly roses need but very little pruning; the bulk of rose pruning is, however, best left until nearer the end of the month, or late frosts may damage young growths.

PERMANENT EDGINGS of box, armeria, aubrietia, arabis, daisies, etc., used around flower beds, should be attended to, and any vacancies that may have occurred be at once filled in.

ECHEVERIAS, sempervivums, kleinias, etc., should be examined and have any dead leaves or decaying parts removed. If they have been wintered in unfavourable quarters have them removed as soon as possible into more favourable positions to prepare for planting when the time arrives.

TUBEROUS BEGONIAS may now be brought from their winter quarters, examined, and placed moderately close together in leaf-mould and sand, in shallow boxes, and placed in a light position in a temperature of from 50 to 55 degrees. As growth ensues, they may be potted up singly, or planted in frames, from which they can afterwards be planted out.

DAHLIAS.—If further increase is necessary, roots may still be placed in heat, and cuttings taken from them; dividing old roots is best left somewhat later. Lobelia cardinalis varieties, if not already divided and potted or boxed up, should be attended to.

ANNUALS.—A further sowing of annuals should now be made inside. Continue to prick off and grow on all plants from previous sowings. An early sowing of annuals in sheltered places outside may also now be made of poppies in variety, mignonette, cornflowers, godetias, French marigolds, calliopsis, and others. Do not bury the seed, but only lightly rake it in on a well-prepared fine surface. In cold, late districts it will be best to postpone sowing for a week or two.—E. F. Hazelton, Knowsley Gardens.

HARDY FRUITS.

TOP DRESSING.—I am greatly in favour of top-dressing most fruit trees early in the autumn, before the leaves fall, especially on light soils and if the trees have borne a heavy crop of fruit. In fact, as soon as the apples have been gathered from our bush and wall trees we give the roots a thorough soaking of liquid manure, and shortly afterwards a good top-dressing of loam, basic slag, and manure is applied to the roots of each tree. But where this work has not yet been attended to, it may be done at once with advantage; first remove some of the old soil, taking care not to injure any more roots than possible, and then give a good dressing, and, should the soil be light, add a good mulching of decomposed farmyard manure.

PEACH AND NECTARINE trees in good bearing will be all the better by having a thorough top-dressing annually, so as to keep the roots near to the surface. The condition of the roots is of more importance than that of the branches, for if the former are unhealthy, or get down into the cold, clayey subsoil, all the attention possible to the latter will be of no use. A firm medium growth is most essential.

RASPBERRY CANES. — These may be shortened back to the required height. If on wires, do not train the canes too thickly, and should the soil be light and porous mulch well with manure. Raspberry canes will be greatly improved by a good top-dressing of loam, or potting soil of a loamy texture.

BLACKBERRIES.—Some blackberries are well worth a little extra care and attention, as the fruits give variety to the year's supply. The old wood, which has borne fruit should be cut out to allow room for that which is to fruit in the coming season. Blackberries may be grown on trellises or on poles.

LOGAN BERRY.—This should find a place in all gardens, as the fruits make excellent tarts and preserves, and are so abundantly produced that many pounds in weight can be gathered from a comparatively small amount of space. Train them similarly to blackberries, and feed well if the soil is porous and light.

GRAFTING.—Head back trees ready for grafting as early as possible. Trees of unsuitable varieties, if healthy, will quickly come into bearing if regrafted.—H. Markham, Wrotham Park Gardens.

THE WEM SWEET PEAS.

The accompanying illustration of the field of the Eckfordian sweet pea, Queen of Spain, is a timely reminder of the immense influence for good the Wem firm has exercised in the past, and continues to exercise upon the development of the fascinating Lathyrus. Every mention of the founder of this house, who a few years since passed away at a ripe age —Henry Eckford—revives pleasant memories either of personal association or of the introduction of some new variety that gave pleasure alike to the raiser and to the cultivator of sweet peas. In these pages the story of Henry Eckford's career has been told at length before to-day. It is therefore enough to mention that this able Scottish gardener, after matriculating at Bewley, Lord Lovat's seat at Inverness, came south, and at Salisbury, and subsequently at Coleshill, the fine Berkshire seat of the Earl of Radnor, devoted much attention to hybridisation and cross-fertilisation, especially amongst dahlias, of which he raised many varieties of exceptional excellence; and this he did without sacrifice of energy and care for the plants under glass, or the occupants of the kitchen garden or fruit plantations.

SWEET PEA QUEEN OF SPAIN, AS GROWING AT WEM, SALOP.
Flowers large, delicate soft pink.

Then, at threescore years of age, when men usually seek repose rather than new worlds to conquer, Henry Eckford became associated with the sweet pea, and in its development and improvement he laboured with unbounded enthusiasm and energy until his death. How successful was his work is well known to all who take an interest in this fragrant flower. It may, however, be mentioned, for the information of those who have within a quite recent period turned their attention to sweet peas, that, although he had only half a dozen or so of varieties at his command when he commenced his memorable work, the varieties he had succeeded in raising by 1890, when the Sweet Pea Conference was held, ran well into three figures. At this great gathering, which will ever occupy a prominent position in the history of the sweet pea, growers from the Continent of Europe and the United States of America, as well as authorities at home, testified in no uncertain manner to the splendid work Mr. Eckford had accomplished.

The reputation of the Wem business as the headquarters of sweet peas has been well sustained. Mr. J. S. Eckford, the son of the founder, as every lover and cultivator so well knows, is as loyally devoted to the cult of these flowers as his father was; and has done, and is doing, much useful work in their development. The Queen of Spain that we have pleasure in illustrating is one of the fine varieties introduced to cultivation by Mr. Eckford last year, and now, with others sent out at the same time, is rapidly passing into general cultivation. The list of novelties for the current season comprises varieties distinguished by the splendid development of their blossoms and the wide range of colours they afford, and thus promise to fully maintain the high reputation the Eckfordian sweet peas have so long enjoyed. The 1908 novelties include James Grieve, a considerable advance among yellow sweet peas; Mima Johnston, a charming variety, exquisitely coloured rose-carmine; H. J. R. Digges, a rich claret-coloured flower that will find much favour with those who appreciate dark sweet peas; Purple King, a richly-coloured flower of much merit; and May Perrett, an extremely beautiful variety with large flowers, ivory white suffused with buff. There are other novelties not less noteworthy than those mentioned, but we would suggest that a copy of the seed catalogue issued by Mr. Eckford be obtained and the lists of sweet peas carefully studied. It is a matter of much interest that the seed of the new sweet peas is so inexpensive as to enable the amateur with very limited resources to participate in the pleasure of growing the new introductions the first year they are placed in commerce.

In addition to the trial grounds at Wem, and the seed farms at the headquarters and elsewhere, a new estate—Althorne Lodge—has been acquired by Mr. Eckford, and this affords a largely increased area for sweet pea culture for seed purposes, which, by the way, has been rendered necessary by the extension of business during recent years. Situate within an easy distance of Burnham-on-Crouch, in Essex, and possessing a soil admirably adapted to the growth of the plants, and a climate favourable to the perfect ripening of the seeds the new farm should prove a most valuable adjunct to the business.

Tubs of Plants, for terraces, verandahs, garden walls, and walks, may now be prepared, these being very attractive when well grown and suitably placed. Old petroleum or other casks sawn in two are very suitable for the purpose, if charred inside and painted outside, and with two handles fixed on and holes bored in the bottom. Numerous plants may be used to fill them, some of the most suitable being zonal and ivy-leaf pelargoniums, fuchsias, marguerites, petunias, hydrangeas, lemon-scented verbenas, and agapanthus. Tubs should be well-drained, and moderately rich soil must be used, that in which melons, cucumbers, and tomatoes were grown in the previous year being suitable.—E. F. HAZELTON, Knowsley Gardens.

TULIP COLOUR EFFECTS.

In the early days, when tulips were almost unknown in Western Europe, an Antwerp merchant one day received a package of bulbs from the East. Part he had cooked as onions, and the rest he planted among the cabbages in his kitchen garden. Here most of them seem to have perished, but the few that lived were taken care of by George Rye, of Mechlin, with whom they produced a variety of beautiful flowers.

It is a long time from then to now, and our gardens and our gardening ideals are vastly different. Perhaps I am not far wrong in thinking that the taste of to-day lies in the direction of being able to maintain a succession of flowers for as long a period as possible. With this end in view many an old favourite has been restored, and new species and varieties introduced. We are familiar with the beautiful effects which can be obtained from suitable and tasteful schemes of colour when early-flowering tulips are used for spring bedding. For example, Artis and White Pottebakker, Prince of Austria and Ophir d'Or, Thomas Moore and Yellow Pottebakker give delightful results when used together in proper proportions.

When, however, we come to the late or May-flowering varieties, we find their value by no means so fully appreciated. In many gardens they are only conspicuous by their absence, and we need some modern George Ryes to rescue them from their neglect, and take them under their care.

In arranging the position of tulip beds or clumps it is well to remember how much depends on environment. Nothing helps tulips more than plenty of greenery. I have in my garden a narrow border, betweent some variegated cupressuses and a walk, and another with Pinus cembra as a background. In both I generally plant tulips. Last spring I had alternate clumps of Coleur Cardinal and White Swan in one and some of the best Darwins in the other. Mr. Farncombe Sanders, White Queen, Night, Europe, Donders, Edmee, Rev. H. Ewbank, and Pride or Haarlem were planted in groups of twelve to eighteen, and made a fine show. Any stiffness was relieved by their difference in height and the daffodil leaves which came between each.

Coleur Cardinal and White Swan belong to what might be appropriately called (to revive an old name) medios or middle flowerers. They are the latest of the earliest and the earliest of the late; Coleur Cardinal is a truly magnificent shade of crimson-scarlet, with a bluish shade or reflection on the exterior of the petals. The stems are stout and solid, and every flow stands stiff and erect. White Swan is the well-known large egg-shaped white, and is famous for the length of time it remains in bloom.

A combination that I had last year, a which I liked immensely, was Bouton d'O and Mrs. Wolseley. The former is a r deep yellow Darwin-shaped flower, with black anthers, and the latter is a very fine form of the old red Maculata. Margarita, rosy-carmine, is a telling variety, a might be substituted for Mrs. Wolseley. A handsome and uncommon effect wh I hope to try another year might be by using Inglescombe Pink and some dark Darwin, such as Zulu or Zanzibar. Another combination that I think would look very nice would be Vitellina (primrose) and Cassandra, cherry-rose.

In the mixed herbaceous border any kind may be introduced if due care is taken to plant so that the colours har-

harmonise with each other and with any other flowers that happen to be near. Naturally, the dwarfer varieties would have places in the front. Among those that are suitable for this position mention might be made of La Rève, a large lasting flower of an indescribable blend of yellow, rose and lavender; Monmouth, a magnificent large scarlet; Isabella, a distinct and very attractive flower of carmine-rose and primrose-yellow; Gloria Mundi, a small bright red flower, with stripes of yellow (I often call it the lamp tulip, for it suggests lighted gas lamps in the street); Glare of the Garden, a long-shaped bright crimson-red; and Strangulata primulina, a beautiful shade of primrose-yellow.

Where it can be managed these late tulips look very well in large beds of one variety. Mr. Farncombe Sanders, bright rosy-red; Scarlet Emperor, scarlet; Inglescombe Yellow, a lovely pale yellow; Bouton d'Or, deep yellow; Sunset, a beautiful Billietiana yellow, with the ends and margins of its leaves a bright red; Gesneriana spatulata, intense crimson-scarlet, with a deep blue base; and La Merveille, orange-red, are some nice varieties for this purpose. They have, however, this drawback. Their bulbs are not properly ripened when it is time to lift them to make room for other plants, hence doubtless the greater popularity of the early section for bedding. Three of the very best varieties for massing in beds of one colour are Artis, bright red; Prince of Austria, orange-red; and Coleur Cardinal, crimson-scarlet. These rival any of the later section.

Space does not permit me to mention the "parrots," and the specific varieties that might be used for brightening the spring and early summer border. Fosteriana, one of the recent introductions from Central Asia, is perhaps the most gorgeous tulip in the world, and a bed of Kaufmanniana (the water lily tulip) resembles nothing so much as a pool of water covered with lovely primrose lilies.

Joseph Jacob.

Libonia floribunda.—At this season of the year libonias, with healthy dark-green foliage, and covered with tubular blooms of vermilion and yellow, are among the most striking occupants of the conservatory. They are at present, unhappily, almost out of fashion, and it is rarely they are seen well grown nowadays, but there are few subjects that fill the gap during the first months of the year so satisfactorily and enduringly, [illegible] adequate attention is accorded. Cuttings should now be struck in heat, potted as soon as rooted, and shifted on during the spring and early summer, taking care that the shoots are well stopped to lay the foundation of a bushy and symmetrical plant, after which they may be stood in a frame until October, when they should again be housed.—T. B. Field, Ashwellthorpe Gardens.

The Banksian Rose, under Glass.—What a charming rose the yellow Banksian is for conservatory planting. It should be given a conspicuous position, such as a wall, pillar or roof. So rapid a grower needs much space to allow of its full beauty being seen, and especially should it be allowed to grow its own way. The White Banksian, too, is even more precious, owing to its powerful violet-like fragrance. There never need be any fear as to these two beautiful roses failing to flower when grown indoors, if attention be afforded them immediately after flowering. This would consist in cutting out the extra vigorous sappy growths, and removing a few others where overcrowded. These Banksian roses flower upon the [illegible] growths imaginable, so that it is necessary not to overcrowd the growths.—T. B. Field, Ashwellthorpe Gardens.

BRITISH GARDENERS' ASSOCIATION. A PUBLIC MEETING will be held at CARR'S RESTAURANT, 264, Strand, W.C. (Close to Temple, Strand, and Holborn Stations), This Evening, SATURDAY, March 7th, 1908, at 7 p.m.

The Chair will be taken by Mr. GEORGE GORDON, V.M.H., etc., Editor of the "Gardeners' Magazine," supported by Members of the Executive Committee.

An ADDRESS on the B.G.A. will be given by Mr. J. WEATHERS, Sec. of the Association.

All Professional Gardeners working in the London Parks and Metropolitan Gardens are invited to attend. Full particulars and Forms for joining the B.G.A. can be obtained by Gardeners from the General Secretary, Talbot Villa, Isleworth.

WOLVERHAMPTON
GREAT ANNUAL FLORAL FETE.
July 7, 8, and 9, 1908.
Valuable Prizes. Schedules now ready.
WILLIAM E. BARNETT, Secretary.

NEWCASTLE FLOWER SHOW.—In conjunction with the Royal Agricultural Show, Newcastle-on-Tyne, July 1st, 2nd, and 3rd, under patronage of the Royal Horticultural Society, whose deputation will award Medals, Certificates, etc., to ANY exhibits deemed worthy.

ENTRIES CLOSE JUNE 10th.

Schedule and full particulars from J. WILFRID PACE, Secretary, Emerson Chambers, Newcastle-on-Tyne.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

MARCH 3.

A wonderfully fine display of plants and flowers delighted the large numbers of visitors to the Royal Horticultural Hall on March 3. The spacious hall was filled with splendid exhibits of forced flowering trees and shrubs, gorgeous orchids, carnations, and early hardy flowers, and during the afternoon the visitors were so numerous that it was difficult to get near some of the displays.

FLORAL COMMITTEE.

A glorious exhibit of forced trees and shrubs was splendidly arranged opposite the entrance by Messrs. R. and G. Cuthbert, Southgate. The firm has set up many beautiful displays, but not one finer than this. Magnolias formed the centre of the group, with lilacs and standard mollis azaleas rising over and around them. On either side were groups of lilacs and large Azalea mollis and Ledum latifolium, with the groundwork filled in with dwarf azaleas. All the plants were finely grown and abundantly flowered. Mr. L. R. Russell, Richmond, Surrey, contributed a beautiful lot of standard lilacs, dwarf mollis, and Indian azaleas, and the fragrant Buddleia asiatica, arranged with palms and euonymuses. Mr. J. Wilkinson, Highlands Gardens, Minchin, Hampton Bourn, contributed a group of well-grown cyclamens.

Carnations and liliums were delightfully shown and arranged by Mr. W. H. Page, Tangley Nurseries, Hampton. The carnations were chiefly Enchantress, Lady Bountiful, Governor Roosevelt, Beacon, Mrs. T. W. Lawson, White Perfection, and Harlowarden. The beautiful Iris reticulata was well represented by Messrs. G. Jackman and Son, Woking, in a group of Primula denticulata alba, Cyclamen Coum, White Squills, and Daphne Mezereum.

In the rockwork arrangement set up by Messrs. J. Cheal and Sons, Crawley, there were coloured primroses, cyclamens, saxifragas, and a few alpine shrubs.

Some splendid blooms of perpetual carnations were set up by Mr. H. Burnett, Guernsey; there were wonderful flowers of Marmion, Mikado, White Perfection, Enchantress, Mrs. H. Burnett, and Jessica. Mr. A. R. Allan, gardener to Lord Hillingdon, Uxbridge, showed a big batch of the useful and effective Lachenalia Nelsoni, thoroughly well grown. The Misses E. and M. Kipping, Hutton, Essex, showed a few rock plants, such as saxifrages, Primula cortusoides, and coloured

INOCULATION
OF

REGISTERED TRADE MARK.
NITRO-BACTERINE
No Packet is genuine without the signature of W. B. BOTTOMLEY.

The Bacterial Cultures are now supplied in 5/- and 2/6 packets, of all Agents & Seedsmen throughout the World.

An interesting pamphlet (Illustrated) giving fullest information will be sent to any address, post free, 4 stamps.

ADDRESS—
NITRO-BACTERINE,
"Review of Reviews" Office,
NORFOLK STREET LONDON' W.C.

primroses. Messrs. T. S. Ware, Lim., Feltham, contributed an exhibit of alpines, staging saxifragas in great variety, primulas, alyssums, drabas, cyclamens, anemones, adonis, hellebores, crocuses, and fritillarias.

Messrs. Barr and Son, Covent Garden, showed a large variety of hellebores, crocuses, and early daffodils. Their varieties of Helleborus orientalis were very interesting, and the new deep marone-purple variety named Peter Barr (A.M.) was one that attracted a great deal of attention, as it had shapely rich-hued blooms freely borne. A very pretty and interesting group of freesias and irises was contributed by Mr. Chapman, of Rye. The Freesia Chapmani, the yellow form, was well staged, and the many seedlings from it show that in the future we may expect numerous distinct varieties to add to our old F. refracta alba.

Carnations were extensively displayed by Messrs. Hugh Low and Co., Bush Hill Park, Enfield, their exhibit including Britannia, Winsor, Mrs. Burnett, Enchantress, Oriflamme—a very free bloomer, pots carrying 50 flowers and buds being shown; White Perfection, Beacon, etc. This firm had also a number of acacias, daphnes, and cyclamens, making up a couple of groups of these flowers. A group of choice lilacs was set up by Messrs. Paul and Son, Cheshunt, and this contained Belle de Nancy, Alba grandiflora, Marie Legray, Marechal de Bassompierre, Mdme. Lemoine, etc., all deliciously fragrant.

Messrs. Jas. Veitch and Sons, Chelsea, contributed growing plants of all the popular carnations, showing their habit as well as their flowers. They also had batches of splendidly flowered Indian azaleas, of Primula Kewensis—beautiful plants, carrying abundance of golden flowers; of Kalanchoe Dyeri, of the sweet Boronia megastigma, of the blue Coleus thyrsoideus, the golden Coreopsis Granti, and the curious pink-flowered Lopezia miniata. A big bank of camellias, the plants smothered with flowers, and associated with pretty plants of Clematis indivisa lobata was arranged by Messrs. W. Paul and Son, of Waltham Cross, and attracted much attention. This firm also exhibited numerous baskets of camellia blooms in a high state of development. Zonal pelargoniums were grandly shown by Messrs. H. Cannell and Sons, Swanley, who also had a fine assortment of free-growing and free-flowering forms of Chinese primulas.

Messrs. W. Cutbush and Son, Highgate, showed a bank of forced azaleas, lilacs, laburnums, and magnolias, and a miniature rock garden filled with Primula denticulata, lovely hepaticas, early tulips, daffodils, adonis, etc. In another group the Highgate firm arranged a collection of perpetual carnations, showing Nelson Fisher, Britannia, Winsor, Mikado, and Mrs. Burnett in fine style. Ferns were largely shown by Messrs. H. B. May and Sons, who had some beautiful nephrolepises, platyceriums, etc., as well as plants of the pelargonium Clorinda, a fine strain of Primula japonica, elegant plants of Clematis indivisa lobata, and a good batch of Primula Kewensis.

Himalayan rhododendrons were well shown by Mr. R. Gill, Tremough Gardens, Penryn, Cornwall, who had a big display of R. arboreum, R. Henry Shilson, R. Mrs. H. Shilson, R. arboreum roseum, and many other delightful forms, rich in colour and fine in truss.

Messrs. J. Hill and Son, Barrowfield Nursery, Edmonton, submitted a group of very fine ferns, showing splendid examples of Gymnogramma elegantissima, Gleichenia semi-vestita, Polypodium conjugatum, Adiantum Bausei, Platycerium grande, Davallia canariensis elegans, Lastrea patens, etc.

Mr. Howe, gardener to Lady Tate, Park Hill, Streatham, made up a splendid group of forced tulips, daffodils, Roman hyacinths, azaleas, liliums, arums, and Solomon's seal, arranging quantities of these useful and well-grown subjects with ferns and palms, and making up a most effective exhibit. From the Guildford Hardy Plant Company, Guildford, came a small group of heathers and alpines. Messrs. R. Wallace and Co., Colchester, sent Iris reticulata, Saxifraga Burseriana major, crocuses, adonises, and hardy cyclamens. Messrs. J. Peed and Son, West Norwood, were represented by a batch of the useful Lachenalia aurea, L. Cammi, and L. Nelsoni, and hepaticas, saxifragas, daffodils, and cacti. Mr. F. Spillard, gardener to Lord Zouche, Parham Park, Pulborough, Sussex, sent a batch of large, freely-flowered cyclamens, all well grown.

Mr. G. Mount, Canterbury, showed some lovely rose blooms, the varieties shown being chiefly Joseph Lowe, a lovely pink H.T., and Richmond; all were grandly exhibited. Mr. G. Reuthe, Keston, Kent, showed Rhododendron grande, R. arboreum, camellias, hellebores, hardy heaths, irises, snowflakes, snowdrops, hardy cyclamens, etc. Forced flowering trees and shrubs were prettily shown by Messrs. Jas. Veitch and Sons, Chelsea, whose display was a large one, consisting chiefly of the white Rhododendron Coombe Wood Seedling, Amygdalus Clara Meyer, Cerasus J. H. Veitch, lilacs, Buddleia asiatica, deutzias, spiræas, forsythias, and wistarias, all very beautiful.

ORCHID COMMITTEE.

A glorious display of choice orchids was charmingly arranged by Mr. H. Alexander, orchid grower to Major G. L. Holford, Westonbirt, Gloucester. It contained magnificently grown dendrobiums, such as D. splendidissimum, D. rubens grandiflorum, D. Wiganianum, D. Psyche, and D. nobile nobilius; these were set up at the back with palms, ferns, odontoglossums, and phalænopsis. In the centre of the group was a bold exhibit of such fine-flowered plants as Cattleya Trianæ, C. T. Westonbirt var., C. T. Aurora, C. T. ampliata, C. T. Perfecta, C. T. Hydra, and a wonderful Lælia Jongheana. At either end were groups of Lælio-cattleya Ariel, a glorious golden-orange hybrid between L. Cowani and C. aurea, but one group had deep orange flowers and the other golden-orange flowers, though all were from the same seed pod. Cœlogynes, Lælio-cattleya Pizarro (A.M.), many superb cypripediums, Lycaste Ballæ, May Gretrix, and the new Lælia Goldfinch were a few other glorious orchids in this superb display.

Messrs. J. Cypher and Sons, St. Albans, showed a batch of Sophronitis grandiflora, set amid dendrobiums in variety, cymbidiums, Lælia Jongheana, Lycaste Skinneri, Odontoglossum Wiganianum, etc. Messrs. Sander and Sons, St. Albans, contributed a small group of orchids, and the leading plants in it were Cymbidium insigne superbum (F.C.C.), C. i. splendens (F.C.C.), Phaius maculatus, the pretty and graceful Odontoglossum Lairessiæ, Cypripedium Curtisi Sander's var., very fine; and a few cattleyas.

Another fine group of orchids was an extensive one set up by Mr. W. P. Bound, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate. Dendrobiums were the great feature of the exhibit, but they were rather too crowded. A few very fine things were D. Cybele Gatton Park var. (F.C.C.), D. Ainsworthi Hazelbourne var., D. Othello, D. Wiganæ, D. Cybele giganteum, D. stratius, D. Chessingtonense (A.M.), D. nobile Dormanianum—a fine plant, and D. Wardianum album. In the centre of the display fine forms of Cattleya Trianæ were grouped into a tall pyramid, with cypripediums at the base. At the ends of the group were Cymbidium grandiflorum, fine examples of Dendrochilum glumaceum and calanthes, the whole making up an elegant exhibit.

From Messrs. Hugh Low and Co., Bush Hill Park, Enfield, came a small group of orchids, consisting of dendrobiums, a few cypripediums, the curious Pleurothallis Roezli, and the handsome new Odontoglossum crispum Carmania, with a pair of heavily marked shapely flowers, the reddish shading being very intense and rich. Messrs. Heath and Son, Cheltenham, brought up finely flowered plants of Primula Kewense, P. grandiflora, Chinese primulas, nephrolepis, and a few orchids.

Several new and beautiful orchids were shown by Messrs. Charlesworth and Co., Heaton, Bradford; these were Odontoglossum Clytie (A.M.), a graceful light purple flowered hybrid between O. Edwardi and O. Pescatorei; and Odontioda Lutetia—O. luteo-purpureum and Cochiioda Noetzleana; other fine things were O. Phœbe, Cymbidium Woodhamsianum, Eulophiella Elizabethæ, the glowing Lælio-cattleya Hypatia, Sophrolælia Felicia (A.M.), Odontoglossum ardentissimum O. Ossulstoni, and the curious O. mulus tenebrosa. Mr. G. Day, gardener to H. S. Goodson, Esq., Fairlawn, West Hill, Putney, showed Miltonia Bleuana with two spikes of fine flowers; several odontoglossums, dendrobiums, and cypripediums were included, and a very pretty form of Cattleya Schroderæ.

Mr. Duncan, gardener to C. J. Lucas, Esq., Warnham Court, Horsham, showed Ansellia africana, many forms of Odontoglossum crispum, O. Wilckeanum, O. triumphans, and several lælio-cattleyas. A very fine plant of Lycaste luteo-alba (A.M.) came from W. Cobb, Esq., Normanhurst, Rusper (Mr. C. J. Salter, gardener, this merited a cultural commendation. Mr. Walters, gardener to H. J. Elwes, Esq., Colesbourne, Gloucester, sent up Pleione yunnanense, and several cypripediums. From Sir Trevor Lawrence's collection came a fine plant of Zygopetalum Balli. The beautifully veined Cattleya Luddemanniana alba var. Empress was shown by J. Bradshaw, Esq., Southgate. Messrs. Armstrong and Brown, Tunbridge Wells, contributed Lælio-cattleya Daffodil (A.M.), several good cypripediums, sephronitis, and odontoglossums. M. Mertens, Mont St. Amand, Ghent, staged several choice odontoglossums, chiefly O. Harryanum hybrids. M. Jules Hye, Ghent, showed beautiful flowers of Cattleya Suzanne Hye de Crom, a glorious white-flowered hybrid between C. Wagneri and C. Gaskeliana alba. Mr. Brooman White, of Ardarroch, sent a small lot of good odontoglossum spikes. From Messrs. Stanley and Co., Southgate, came a group of odontoglossums, dendrobiums, and cattleyas. M. Maron, Brunoy, France, submitted the large-flowered and beautiful Lælio-cattleya Helen Maron (A.M.), soft purplish-lilac, with big frilled lip.

Mr. H. J. Chapman, gardener to Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne, showed some beautiful odontoglossums, but among the many good things the seedling O. crispum Chapmanse, raised from O. Cooksonianum and O. Cooksoniæ, was the most interesting; O. c. Memoria Battle of Waterloo was especially good.

FRUIT AND VEGETABLE COMMITTEE.

Mr. Spillard, gardener to Lord Zouche, Parham Park, Pulborough, showed a few dishes of finely-kept clean apples, such as Annie Elizabeth, Hoary Morning, Gloria Mundi, and Blenheim Pippin.

CERTIFICATES AND AWARDS.

First-class Certificate.—Dendrobium Cybele, Gatton Park var., from Mr. W. P. Bound, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate; Cymbidium insigne superbum and C. insigne splendens, from Messrs. Sander and Sons, St. Albans.

Award of Merit.—Dendrobium Cheningtonense, from Sir J. Colman, Bart.; Maxillaria luteo-alba, from W. Cobb, Esq., Rusper. Lælio-cattleya Helen Maron, from M. Chas. Maron, Brunoy, France; L.-c. Pizarro, from Major Holford, Westonbirt, Gloucester; L.-c. Daffodil, from Messrs. Armstrong and Brown, Tunbridge Wells; Sophro-cattleya Felicia and Odontoglossum Clytie, from Messrs. Charlesworth and Co., Bradford; Helleborus orientalis Peter Barr, from Messrs. Barr and Sons, Covent Garden.

MEDALS.

Gold.—Mr. H. Alexander, orchid grower to Major Holford, Westonbirt, Gloucester; Mr. W. P. Bound, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate; Messrs. R. and G. Cuthbert, Southgate, Middlesex.

Silver-gilt Lindley.—Mr. W. Howe, gardener to Lady Tate, Park Hill, Streatham.

Silver-gilt Flora.—Messrs. J. Veitch and Sons, Chelsea; Messrs. W. Cutbush and Son, Highgate; Messrs. Hill and Sons, Edmonton; Mr. H. J. Chapman, gardener to Norman C. Cookson, Esq., Wylam-on-Tyne.

Silver Flora.—Messrs. Charlesworth and Co., Bradford; Messrs. J. Cypher and Sons, Cheltenham; C. J. Lucas, Esq., Warnham

Shrewsbury Floral Fete.

ANNUAL MEETING.

At the annual meeting of the Shropshire Horticultural Society, held at the Music Hall, Shrewsbury, with the Mayor in the chair, a most gratifying record of the year's work was presented by the committee. After the usual preliminary matters had been disposed of,

Mr. W. W. Naunton read the annual report, in which the committee said they had again to congratulate the members of the society upon a successful year's work. The summer show had been remarkably good, and the weather propitious, which, having regard to the past summer, was most fortunate, and the attendance in excess of any previous year. The total receipts from all sources amounted to £5,922 12s. 8d., being £283 17s. 5d. in excess of the previous year, which year was higher by £400 8s. 4d. than any other year. It was gratifying to see that the number of annual subscribers steadily increased, the subscriptions last year amounting to £536 11s. The takings at the gates on the two days were also greater, amounting to the sum of £3,485 4s. 3d., as against £3,317 10s. 11d. The accounts showed that the balance of assets in 1907 amounted to £786 11s. The expenses of carrying on so great a show were necessarily large, but the committee were keeping a watchful eye on the expenditure side of the account, and would see it did not unduly increase. It was almost unnecessary to refer to the main features of the show, as the magnificent results obtained were so well and widely known. The committee reported that, in consequence of a rearrangement of the refreshment tents, considerably more space was available for the public in the Quarry, and, although the numbers present were greater, the pressure seemed less. Some changes were also made in the musical arrangements last year, which the committee trusted were found to be beneficial. The committee regretted to report that, in consequence of certain technical and legal difficulties raised by the Board of Trade, it had not been found possible to carry through to a successful end the proposal to register under the Companies Act 1867, mentioned in the last report, and the matter had therefore been dropped for the present.

Mr. James Vine next submitted the financial statement, which showed that on the receipt side the items included £735 1s. from refreshment contracts, £506 18s. 1d. tickets sold before show, £100 5s. 9d. profit on sale of programmes, £1,203 3s. taken at gates first day, £2,282 1s. 3d. taken at the gates second day. The disbursements included £142 8s. 4d. spring show expenses. With regard to the summer show, the prize money expended amounted to £1,238 12s. 3d., and among other items were £544 7s. special attractions, fireworks, etc., £500 bands, £102 11s. horse-leaping, £195 0s. 11d. printing, £608 5s. 7d. hire of tents, staging, and fittings, £219 5s. 7d. advertising, £169 11s. 8d. ground expenses, and £188 2s. 9d. bill posters. The society's total receipts for 1907 amounted to £5,922 12s. 8d., and the payments to £5,136 1s. 8d., leaving a balance of £786 11s. The receipts from the summer show amounted to £5,683 9s. 4d., and the payments to £4,449 3s. 11d., leaving a profit on the summer show of £1,234 5s. 5d.

The report and balance-sheet were, on the motion of Mr. Peele, seconded by Mr. Deakin, unanimously adopted.

Mr. Beville Stanier was unanimously elected president for the year. Votes of thanks were accorded as follows: Colonel Hope Edwards, for his services as president during the past year; to the Mayor and Corporation for the use of the Quarry for the purposes of the summer show; to the managing committee, to Messrs. Phillips and Vine, the treasurers; and to Messrs. Adnitt and Naunton, the hon. secretaries. In submitting the votes of thanks to the several officers and members, the speakers referred in eulogistic terms to the splendid services they had rendered the society by the judgment and energy they had brought to bear upon the management of the society's affairs.

SIAMESE ROYAL WARRANT.

In a recent issue we had the pleasure of announcing that Messrs. James Carter and Co., the well-known seedsmen of High Holborn, had been appointed seedsmen by Royal Warrant to His Majesty the King of Siam; and now, through the courtesy of the firm, we are able to give a facsimile of the warrant, and an illustration of the Royal Arms of Siam. As the Siamese characters and the Royal Arms are by no means familiar to residents in this country, the illustrations of them can hardy fail to prove of much interest to our many readers.

SIAMESE ROYAL WARRANT.

OBITUARY.

THE MARQUIS OF LINLITHGOW.

The Marquis of Linlithgow, whose regretted death took place at Pau on February 29, was a liberal patron of horticulture and arboriculture, and his magnificent estate at Hopetoun House, Linlithgowshire, was kept in the finest of condition. Within recent years the gardens, which have been described in our columns, have been improved through the active personal interest of the Marchioness, who is a devoted gardener, and the late nobleman was justly proud of his beautiful gardens and the policies, in the former of which Mr. Thomas Hay, the gardener, has done some splendid work in the way of development and improvement. The late Marquis was a model employer, and the relations between master and servants were excellent. Lord Linlithgow was a generous supporter of horticultural societies, and took a special interest in those connected with his extensive estates.

MR. WM. COLEMAN.

For a long number of years one of the most famous of horticulturists in this country was "Coleman of Eastnor," but during recent years, during the quiet evening of his life, the name of Mr. William Coleman has been less prominently before the public. Mr. Coleman died on Thursday, February 20, and was buried at Eastnor on Monday, February 24. He was born at Rolleston in 1827, and his gardening career led him to Cole Orton, Grimston Park, Pontypool Park, Crewe Hall, Veitch's Chelsea Nursery, and finally to Eastnor Park, Ledbury, where he was appointed head gardener in 1860. He continued to act as head gardener for thirty years, and was then promoted to the position of agent to the Eastnor Estates for Lady Henry Somerset. Altogether, he was forty-two years at Eastnor, and during that time made the place and himself famous. Mr. Coleman was a fine character and a splendid gardener, a man in whose footsteps not a few of our younger men are striving to tread—what better fame can a man have.

TRADE NOTE.

Sun-dials now form a part of the ornamentation of most gardens, and those who have not studied the forms and styles of these timepieces will be surprised how varied they are. We have before us a most interesting and entertaining catalogue, issued by Messrs. F. Barker and Son, 12, Clerkenwell Road, London, a firm who specialise in sun-dials, wind vanes, barometers, etc. We learn that the sun-dial was in use 2,600 years ago, and we are asked: "What could be nicer in making a garden interesting and attractive than a sun-dial mounted on a suitable pedestal, and placed 'Amyddst ye fflowres to mark ye passing of ye houres,' and a rustic seat close by, where one can sit and meditate in quietude, lifted, as it were, out of the dulness of ordinary life into a region of romance and imagination? A garden, however beautiful, seems, to some extent, destitute of dignity and interest without a sun-dial, however simple of construction. There is a feeling of curious interest and '[illegible] into' in this silent monitor of time; there is no irritating ticking, or striking of [illegible], but silently as surely the sun-dial does its work year in and year out."

The method of setting the various sun-dials is given, and there are an equation table, numerous illustrations of dials and pedestals, a disquisition on the magnetic compass, an interesting set of fifty different mottoes for sun-dials. This catalogue is a useful one to keep at hand.

ANSWERS TO CORRESPONDENTS.

ADDRESS.—S. J., Cambridge: The address is Mr. James Douglas, V.M.H., Edenside, Great Bookham, Surrey.

ANNUALS FOR CUTTING.—M. A., Brighton: A good selection of kinds for your purpose includes asters, coreopsis, sweet sultans, double godetia, chrysanthemums, mignonette, dwarf sunflowers, Gypsophila elegans, Lavatera trimestris, stocks, scabious, poppies, and sweet peas.

SINGLE PYRETHRUMS.—R. J. H., Lancaster: There is no need to wait until autumn before planting single pyrethrums. If your ground has been well prepared then order the plants at once, and plant them directly they arrive. Plant firmly, give water if necessary, and mulch with half-decayed manure to prevent March winds from drying up the soil.

RENEWAL OF BOX EDGING.—A. R., Taunton: The work of replanting a box edging should be done at once. The chief points to consider are the maintenance of a perfectly straight and level line of plants, and to be careful that the plants lifted are not unduly exposed. Place a damp mat over them, and draw out sufficient for immediate use as the work proceeds.

NEW CHRYSANTHEMUMS.—P. C., Scarborough: We understand that the leading class at the National Chrysanthemum Society's exhibition, to be held in November next, will be a new and distinct one. Only those varieties distributed in quite recent years will be eligible. We have not the full particulars before us as the schedule has not yet been issued, but we may say that Messrs. Davis, Godfrey, Jones, and Wells are contributing the substantial prizes.

EMPLOYMENT AT EDGBASTON.—R., Burton-on-Trent: If we are to judge from your letter—and that is all we have to help us—there is considerable need for you to improve your general education. Your caligraphy is good, but there is room for improvement in grammar and composition. We believe there are no special regulations at the Botanical Gardens, Edgbaston, as there are at Kew, but you will receive full information if you send a request for employment to Mr. Thomas Humphreys, curator, Botanical Gardens, Edgbaston, Birmingham.

FUCHSIAS.—F. S. H., West Leigh: The fuchsias have been very hardly treated. Place them in the smallest pots that will accommodate them, and stand them in a warm house; take a few cuttings from the young shoots that will soon push from the tips of the old wood, and as soon as this has been done prune the old plants back rather severely. This will induce root action, and new growths will start from the basal buds, and these may be pinched once, and then allowed to grow freely. It would be a mistake to cut the plants right down; the cuttings will give you sufficient dwarf plants if they are properly cared for. In the case of the roses, plant these at once, and as soon as they show signs of growth prune them hard. We cannot promise you much success, and everything depends on the present condition of the several plants.

LYCOPODIUM FOR SURFACING.—W. B., Bridgwater: It is, no doubt, to Selaginalla Kraussiana you refer, as this plant is used for surfacing, and is not infrequently known in gardens as lycopodium. For table plants the selaginella may be dibbled in thickly over the soil surface soon after potting, and nothing more will be needed, because every bit will root readily in a warm house. When so treated there is a danger of the surfacing becoming bare or straggling in due course, hence another plan is frequently adopted, and that is of propagating the selaginella freely and frequently in shallow pans or boxes, and lifting and placing the amount required on the surface of the pot, in the case of plants that are to do duty in the house. S. Kraussiana strikes freely in heat, but it should not be kept in strong heat very long, or it will become drawn.

GRUBS IN CYCLAMEN AND FERN ROOTS.—N. D. P., Littlehampton: The grubs sent are those of Otiorhynchus sulcatus, the vine weevil, a pest closely allied to and very much like O. picipes, the clay-coloured weevil, so well figured and described on p. 166 of the GARDENERS' MAGAZINE of February 29. It sometimes happens that the soil used for potting contains grubs, and if there is a possibility of this then such soil should be sterilised before use by submitting it to heat sufficient to kill all animal life. The weevils are often very destructive in vineries, and should be hunted for at night after the manner described on p. 166. Where ferns and other plants are infested, it is possible to kill the grubs by immersing the plants in water for from twelve to twenty-four hours. The condition of the plants must be considered, of course, otherwise the cure may be as bad as the disease.

ALOCASIA METALLICA.—W. B., Bridgwater; The probability is that your plant has been wintered in a rather too low temperature, and kept too dry. A good winter temperature is 65 degrees. The present is a good time to deal with alocasias, and an annual potting is usually desirable. Turn the plant out, remove all old soil and decayed roots, and put the plant in a clean pan or pot. The latter should be amply drained, a third of its depth being filled with crocks. Over these place some rough material from the potting compost. A suitable mixture consists of two parts peat fibre, one part loam fibre, and two parts clean sphagnum moss, with a plentiful addition of small crocks and coarse sand. So arrange the plant that its crown is well above the compost, the latter sloping from it to the rim of the pot or pan. Thus you will see that the method of potting is very much the same as followed for many orchids. Abundance of heat and moisture are necessary to secure the best results from alocasias. A. metallica may be grown to a very large size.

TAR PAVING FOR TERRACE.—A. W. G., Cardiff: We are not sure that we fully understand your question. If the present answer does not meet the case please write us again. Over a well-drained and solid foundation place about three inches of material made by mixing moderately fine gravel with hot tar and pitch until a stiff, mortar-like consistency is obtained. Rake this into shape, sprinkle with fine binding gravel and roll well, adding more gravel as the rolling proceeds. Sufficient gravel may, of course, be added to produce a gravel surface, but as a walk depends, for its firmness, on its solidity, it will be obvious that if much gravel is added, and not rolled into the tarred material, it will form a surfacing that is likely to move with use. If you want a gravel path only, then there is no need whatever to use tar beneath, provided a good foundation is made, with the coarse gravel over this, and then three to six inches of good binding gravel of a finer description. If the work is well done and the gravel good such a path will be firm enough for all ordinary garden purposes.

NAMES OF PLANTS.

S. P. R., Crawley.—Anœctochilus Dawsonianus.

E. S., Carlisle.—1, Iris japonica; 2, Saxifraga Burseriana.

W. B., Bridgwater.—Eranthis hyemalis, the Winter Aconite.

A. B. J., Bridgwater.—1, Corylopsis spicata; 2, Hamamelis arborea.

R. N. H., Ipswich.—1, Dendrobium Ainsworthi; 2, Lælia anceps, a good form.

D. D. G., Hampton.—1, Clematis cirrhosa; 2, Asplenium Fabianum; 3, Didymochlæna lunulata.

C. T. F., York.—1, Leonotus Leonurus; 2, Saintpaulia ionantha; 3, Cupressus nutkænsis; 4, Dendrobium cretaceum; 5, Cypripedium villosum; 6, Nephrolepis Duffi.

NOTES OF THE WEEK.

Bark.

Bark, in its numerous forms is one of the most curious means of plant protection, consisting as it does of a sort of crust of dead inert matter secreted and accumulated outside the living, active cellular growth which builds up the annual ring of the tree or shrub concerned. A fair parallel to it may indeed be found in the animal kingdom in the shape of crustaceous and other shells, which in like fashion serve as protection to the tender, living tissues beneath them. Bark, however, varies in its nature far more than do shells, which are merely lime or carbonate of lime, or, it may be, flint, for combined with the dead ligneous matter, there are various alkaloids and other chemical agents which are of great use to mankind, but which were primarily evolved, no doubt, to prevent insect attack by their bitterness, or even poisonous qualities. Thus in the oak we have the intensely acrid principle of tannin, so valuable in our leather industries: in the cinchona we have the invaluable alkaloid quinine, the finest febrifuge and tonic known: and in the willow we have the less potent, but still valuable salicine as a milder remedy on similar lines. These are but types of many such repellent salts which must be of great service by preventing the boring into and destruction of the protective bark by grubs, etc., which often lead to the death of more assailable trees. Barks also vary markedly in structure and thickness. Thus, in the birch the bark consists of thin skins, smooth of surface and silvery in colour; in the plane it appears as a series of plates, the outer ones of which are shed annually as fresh ones form below: in the oak it forms ragged masses, and in the cork tree we have it in very thick sheets, corrugated outside, and formed throughout of the dense elastic brown material with which we are so familiar. A curious feature is the variable modes in which barks that are not shed adapt themselves to the annually increasing girth of the tree they envelop. The corrugated rough and rugged barks become so by a process of cracking, as the new wood beneath demands more room, fresh bark being deposited to heal the fissures thus caused; and as these fissures continue to be the weakest points in the armour, the natural result is that they get deeper and deeper, and the ruggedness of the exterior consequently becomes more and more emphasised. Other barks, such as that of the beech, are more elastic, and adapt themselves to increased girth by a fairly uniform expansion, fresh bark being, as it were, infiltrated from beneath in the process, so that few actual fissures become evident. Bark proper is confined to such plants as produce annual rings of wood outside those previously formed, the so-called exogenous trees. A tree trunk really consists of three parts, a central cylindrical mass of wood which contributes nothing to the vitality of the tree, but only to its structural support; outside this is the active, living formative cells, which, during the growing season perform two offices, that of conveyance of the sap collected by the root system to the foliage above, and of recieving in return from that foliage some of the material elaborated by the leaves under the influence of the sunlight, and converting this into wood, and, finally, there is the bark which covers and protects the whole. The life of the tree, therefore, so far as the trunk is concerned, is confined to a thin ring of active cells, of which the bark is the only protector, so that it is quite easy for us to understand that stripping the bark on a large scale may easily prove to be a mortal wound. Furthermore, when we consider that it is precisely this thin underskin of vitality which constitutes the feeding ground of any vermin, but actual wood eaters, we can see how essential it is that bark protection should be thorough. Hitherto we have spoken only of the trunk, but bark pervades the entire tree; trunk, branch, and minutest twig have their armour-plating on lines relative to their age and size, and also contain the register of their age in the number of wood-rings beneath.

MR. ALFRED TATE.
Vice-President of the National Rose Society.

Mr. Alfred Tate, whose portrait we have the pleasure of giving in this issue, is well-known as an enthusiastic and highly successful rosarian; he is happy in the possession of a genial temperament, and generous in permitting others interested in roses to freely participate in the enjoyment of his wondrously beautiful garden, and is held in the highest estimation. Mr. Tate is best known as an exhibitor of garden roses, and the magnificent collections from his gardens that have been staged at the leading exhibitions have done much to popularise good free blooming varieties. Having regard to his remarkable success as an exhibitor of garden roses at the shows of the National Rose Society and some other of the leading societies, it is a matter of some interest to mention that Mr. Tate does not attach undue importance to bunches of large size. He would appear from the evidence derived from his collections to regard high quality and taste in arrangement as of primary importance. The collections are indeed models in their way, for the flowers are invariably in the highest state of development, and they are presented in a manner that at once arrests attention and gives pleasure to those fortunate in the possession of artistic perceptions. With exhibition varieties Mr. Tate has also been successful, and notwithstanding the disadvantages of soil he has on more than one occasion attained to a high position in the contest for the amateur championship; and in other classes he has been successful in winning first prizes well-nigh innumerable. The rose garden which Mr. Tate has formed at Downside, his charming residence at Leatherhead, is unique, and may well be described as a veritable triumph of art over nature. It is unquestionably the finest garden of its kind in the United Kingdom, and we shall be surprised to learn that it has an equal in any part of the world. Had the soil at Downside been more or less suitable for roses the garden would have been deserving of the highest praise for the taste with which it had been designed, the skill with which it was planted and the luxuriant condition of the thousands of roses located within its boundaries. So far from the soil being a deep holding loam such as that in which roses delight, it is thin, and rests upon a bed of chalk of enormous thickness. Therefore all the beds and borders had to be excavated to a depth of several feet, and the chalk with its thin covering of soil replaced with good loam brought from a distance. When any considerable proportion of the soil of a garden of quite moderate dimensions has to be replaced with new it is usually regarded as a serious business; and when it is stated that the rose garden at Downside has an area of between three and four acres there will be no difficulty in appreciating the task Mr. Tate has accomplished. Mr. Tate, it may be added, is hardly less appreciative of hardy herbaceous plants, carnations, water lilies, and beautiful trees and shrubs, and as a consequence thereof these subjects form great and attractive features in the delightful gardens of Downside.

Royal Horticultural Society.—The next Fruit and Flower Show of the Royal Horticultural Society will be held on Tuesday, the 17th inst., in the society's hall. A lecture on "Beautiful Flowering Trees and Shrubs," illustrated by lantern slides, will be given by Mr. George Gordon, V.M.H., at three o'clock. At the general meeting of the society held on March 3, 113 new Fellows were elected, making a total of 305 elected since the beginning of the present year.

Compounds (Poisonous) for Horticultural and Agricultural Purposes.—The Poisons and Pharmacy Bill has successfully passed its second reading in the House of Lords, and has been referred to a Joint Committee of both Houses of Parliament. The horticultural trade is materially interested in this Bill, as by Clause 2, power is given for persons, other than chemists, such as nurserymen, seedsmen, and agricultural agents, to stock and sell (under provisions to be made by the Privy Council) weed killers, insecticides, sheep dips, etc. It will be remembered that the Traders in Poisonous Compounds for Trade Purposes Protection Society has, for years past, been working to this end, and it is due to the efforts of the society that this clause has been inserted in the Bill. All those interested in the sale of these compounds should assist the society in its efforts to induce members of Parliament to support Clause 2 of the Bill, so that the same may become law this session.

Foreign Fruits were rather more plentiful in British markets during February than in the corresponding month of last year, the largest increases being in the imports of bananas, lemons, and oranges, with which fruit growers in this country are not immediately concerned. The largest decrease was in the imports of apples, the total having been 267,448 cwt. of the value of £603,840, against 329,579 cwt. of the value of £653,337. Peaches and apricots were also imported in smaller quantities, the total having been 209 cwt. of the value of £1,128, or a decrease in quantity of 155 cwt. and in value of £1,222, Of bananas the imports were 420,077 bunches of the value of £112,092, an increase in number of 96,932 bunches, and in value of £37,431. There was also a material increase in the imports of grapes, the total being 1,506 cwt. of the value of £6,979, an increase in quantity of 898 cwt. and in value of £4,333. Lemons, almonds, and oranges were imported in considerably increased quantities, and the totals were very large. The imports of pears were larger than they have been in the corresponding month of several years past, and as they reached this country in rather better condition than for some years they commanded a good price. The total of the imports was 3,405 cwt., and the value was £7,061. There was a big drop in the imports of plums, the aggregate having been only 440 cwt. of the value of £977, against 775 cwt. of the value of £2,196 in the corresponding month of last year. Still larger was the relative decrease in the imports of unenumerated fruits, the total having been 2,786 cwt. of the value of £4,855,.or about one-half the quantities received in February, 1907. The total value of the fruits imported during the month was £726,827, or an increase of £51,460.

Gardeners' Royal Benevolent Institution.—The Liverpool Auxiliary has arranged their annual smoking concert in aid of the funds for Saturday next at the Bear's Paw, Liverpool. Allan H. Bright, Esq., J.P., has promised to preside, and the committee has obtained the services of a band of capable artistes, through whom they hope to provide a most enjoyable entertainment. Mr. R. G. Waterman, of Woolton, is the hon. secretary.

Insects and Flowers.—Professor Bottomley gave a most interesting lecture before the Royal Botanic Society, at Regent's Park, on Friday last. He pointed out how insects were attracted by the colour, odour, and nectar of flowers, and thus induced to perform the work of fertilisation. He described the floral world as a place of unlimited public-houses, with free drinks, and, citing the Cuckoo pint or wake robin, he showed how midges became intoxicated by its nectar, but as soon as they recovered they at once flew to the next sign—the purple shaft or spadix of the flower.

Mr. James Whytock, the new president of the Scottish Horticultural Association, in his inaugural address at Goold Hall, Edinburgh, expressed the opinion that the art of gardening would flourish more than it yet had done, and that there was a great future for commercial horticulture, and for horticultural specialists. Mr. Whytock roughly grouped professional gardeners into four sections—nurserymen and seedsmen, market gardeners, city and town gardeners, and private gardeners.

R.H.S. "Journal."—The first part of the thirty-third volume of the Royal Horticultural Society's "Journal" has been issued, and is remarkable both for its interest and usefulness. The most important of the contributions to its pages are "The True Darwinism," by the Rev. George Henslow, V.M.H.; "British Guiana," by J. A. Barbour James; "The Relation of Meteorology to Horticulture," by Mr. R. H. Curtis; "The Amateur and Horticultural Law," by Mr. H. Morgan Veitch; "Japanese Dwarf Trees," by M. A. Maumerné; "Mistletoe," by Mr. W. Smythe; and "Gesneraceæ: Annotated List of Genera and Species." The reports on the trials of perennial asters, cannas, dahlias, tulips, melons, strawberries, French beans, kales, and outdoor tomatoes, conducted at Wisley, form an important part of the "Journal," and are especially deserving the attention of cultivators.

Preparation of Potato Sets.—Recognising the fact that home-grown seed potatoes are often in a bad condition at planting time, the authorities at the Harper Adams Agricultural College arranged an experiment with a view to ascertain the effect on the vigour of the plant and on the crop of removing the first sprout in early and mid-season varieties. The varieties selected for the experiment were Ninetyfold and British Queen, and the first sprout was retained in one lot of each variety, and the sprouts rubbed off the tubers of the other lots previous to planting. The haulm of the sprouted seed was first in making its appearance above the surface, and made the most vigorous growth throughout the season. When the crop was lifted the results obtained were per acre: Ninetyfold, sprouts retained, 9 tons, 3½ cwts., sprouts removed 6 tons 14 cwt. British Queen, sprouts retained 11 tons 1¼ cwt., sprouts removed 9 tons 8¼ cwt. The results obtained in this experiment clearly indicate the need for careful treatment of seed potatoes and of the value of sprouting, more especially in the case of early varieties.

Vegetable Imports.—These were considerably larger in February than in the corresponding month of last year, all the kinds showing increases. The imports of potatoes aggregated 509,195 cwt. of the value of £102,037, as compared with 73,353 cwt. in February, 1907. Of the quantity France sent 289,369 cwt., Germany 54,705 cwt., Channel Islands 3,659 cwt., and other countries 161,462 cwt. Of onions the imports were 743,910 bushels of the value of £80,071, an increase in quantity of 171,655 bushels, and in value of £10,412. The imports of tomatoes were 69,350 cwt., of the value of £57,3[illegible], against 58,289 cwt., of the value of £50,765, in February, 1907. The imports of unenumerated vegetables were of the value of £37,525, or an increase of £6,603.

Ghent Quinquennial.—The King of the Belgians has consented to open the great exhibition of the Royal Agricultural and Botanical Society of Ghent, which will be held next month.

Brussels International Exhibition.—At a recent meeting of [illegible] Council of the Société Royale de Flore was decided to offer to the Committee [illegible] the International Exhibition to be held [illegible] Brussels in 1910 the assistance of the [illegible] ciety in organising the flower shows. [illegible] offer is made in conjunction with the [illegible] Royale Linnéenne. It has further [illegible] decided to form floricultural, orchid, [illegible] chrysanthemum, scientific, rose, and [illegible] den architecture sub-committees.

Floral Decorations at Bishop's Waltham.—In the schedule of the Bishop's Waltham Horticultural Society, just received, we find that floral decorations receive special encouragement. At the show to be held on July 29 there will be an open class for a table decoration, orchids excluded, and the prizes are £5, £3, and £2, respectively. We are glad to find a class for a table decoration of wild flowers, grasses, or berries, and several classes for flower arrangement open only to ladies. Vegetables and sweet peas receive much attention, and cottagers are well catered for. An interesting side issue of this society is its children's show, to be held on July 10. There are fourteen classes open to the youngsters, who are grouped according to age; the classes are chiefly for wild flowers, grasses, and tree twigs, and all the vases or other designs have to be made up in the schoolroom under the eye of the committee. Our friend, Mr. E. Molyneux, V.M.H., is hon. secretary of the Bishop's Waltham Society.

CYMBIDIUM INSIGNE SANDERI SPLENDENS.
Flowers pink and purple. F.C.C., R.H.S., March 3; Messrs. Sander and Sons, St. Albans.

Forestry Education at Oxford.—We learn from "Nature" that the average number of forestry students at Oxford during 1907 was fifty-seven. The forest garden and experimental plantations in Bagley Wood have been much increased during the year, and the lack of accommodation is about to be met by the generosity of St. John's College. A block of buildings for the accommodation of the professor of rural economy was erected in Parks Road during the years 1906-7. It is now proposed to add further accommodation for the forest branch, consisting of a lecture theatre, a class-room, a museum, a library, and a professor's room. The new buildings will be ready by the end of 1908.

A Hopeful Outlook.—American nurserymen foregather more frequently than do their British confreres, and they have grouped themselves into several associations. The Western Nurserymen's Association recently met, and the members deplored the ill effects of the weather last autumn on their stock. Mr. A. Willis, the president, referred to this matter, to the money panic in America, and to the consequent disorganisation of railway carriage, but added that the losses had not been sufficient to cripple their work. His closing remarks were: Let us contemplate the scene before us; there are lands to plant as fertile as the Valley of the Nile, there are seeds and plants within reach, there are labourers with willing hands waiting our bidding, the bright sun shines, the gentle rain waters the thirsty earth, and a gracious heavenly Father has commanded that the seed sowed shall bring forth plants and trees after their kind, and a multitude all over this broad land are stretching forth their hands to us and asking for the products of our craft that they may plant and grow fruit for food and trees and plants for shelter and beauty. Let us arise and plant, being sure we shall reap in due time if we faint not.

Solanum Commersoni Violet, about which a good deal has been heard and written, has not realised the expectations of its friends. Some French growers claimed for it considerable disease-resisting and frost-resisting powers, and M. Labergerie had great faith in its usefulness under varying conditions. In Ireland, however, a series of experiments conducted by the Department of Agriculture, go to show that this potato has not established any claim for special consideration, and that there are many superior varieties.

PLECTRANTHUS CRASSUS.

From Central Africa we have, within the last decade or so, received several pretty flowering members of the Labiate family. One of them, Coleus thyrsoideus, has for a long time been an established favourite owing to the flowers being of such a charming rich shade of blue. A second species, C. shirensis, of more recent introduction, is decidedly pretty, but scarcely likely to attain the popularity of the older kind. The blue of the flowers is not so striking, though the habit of the plant is good. To these two African labiates may be added Plectranthus crassus, which well merits extended cultivation. It is a stout-growing plant, reaching a height of eighteen inches to two feet or more, the stems being clothed with ovate leaves about four inches long and half as much in width. In colour they are of a pale green. The flowers, which are borne in narrow terminal spikes, are arranged in whorls, which develop for a considerable time, and thus maintain a succession of bloom. In colour they are of a lavender-blue tint, certainly less showy than Coleus thyrsoideus, but decidedly useful in the depth of winter. The shoots, even if the tops are pinched out, do not branch very freely, hence this plectranthus is seen to better advantage when three plants are disposed triangularwise in one pot rather than grown singly. When one remembers how readily the different coleus intercross with each other, and how quickly a great number of foliage varieties made their appearance after the introduction of two or three kinds with handsome leafage, it is almost a matter for surprise that Coleus thyrsoideus and its near relatives have not been taken in hand by the hybridist.

W. T.

NEW PLANTS, ETC.

◆

CYMBIDIUM INSIGNE SANDERI SPLENDENS.

This beautiful orchid has flowers from three to four inches across; white, rose, or blush-tinted sepals and petals, with a line of colour down the centre of each. The lip is especially handsome, deep rosy mauve, freely marked and spotted with rosy crimson. F.C.C., R.H.S., March 3; Messrs. Sander and Sons, St. Albans.

CYMBIDIUM INSIGNE SANDERI SUPERBUM.

In this variety the flowers are of a charming pink shade, and the lip is of similar colour, with spots and markings of deep rosy purple. F.C.C., R.H.S., March 3; Messrs. Sander and Sons, St. Albans.

DENDROBIUM CYBELE GATTON PARK VAR.

A very large-flowered and handsome dendrobium, derived from D. nobile nobilius crossed with D. Findlayanum. The broad sepals and petals are white tipped with purple, while the big, rounded lip is deep and bright purple with a large central orange blotch. A very fine orchid. F.C.C., R.H.S., March 3; Mr. W. P. Bound, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate.

DENDROBIUM CHESSINGTONENSE.

A shapely dendrobium, obtained by crossing D. aureum with D. Wiganiæ. It has very soft light yellowish sepals and petals and a rather brighter lip, on which are deep brownish markings, suggestive of D. aureum. A.M., R.H.S., March 3; Sir Jeremiah Colman, Bart.

LÆLIO-CATTLEYA DAFFODIL.

A rather small-flowered, but shapely and beautiful hybrid from L.c. Mercia and L. Jongheana alba. The flowers are of excellent substance, white, shading to yellow at the tips of the sepals and petals, with a rich yellow lip. The latter is very pretty, and has a frilled margin. A.M., R.H.S., March 3, Messrs. Armstrong and Brown, Tunbridge Wells.

ODONTOGLOSSUM CLYTIE.

An unusually pretty and graceful odontoglossum obtained by crossing the deep purple, small-flowered O. Edwardi with O. Pescatorei. The branching spike is tall and arching, and carries a large number of neat light purple flowers, freely marked with dark vinous purple. For grouping this should eventually become a very popular hybrid. A.M., R.H.S., March 3; Messrs. Charlesworth and Co., Heaton, Bradford.

BRASSO-CATTLEYA HELEN MARON.

A very fine form, suggestive of B.-c. Digbyano-Mendeli; parentage unrecorded. The plant exhibited carried a pair of splendid flowers, of a soft lilac shade, with a big fringed lip that is lilac, lightly marked with purple and shading to green in the throat. A.M., R.H.S., March 3; M. Chas. Maron, Brunoy, France.

MAXILLARIA LUTEO-ALBA.

A very old species, with flowers that are coloured yellow, green and white. They are of fair size and freely produced in a semi-pendant fashion. The plant exhibited carried about seventy flowers, and was a very fine example of good culture. A cultural commendation was awarded. A.M., R.H.S., March 3; Mr. C. J. Salter, gardener to Walter Cobb, Esq., Normanhurst, Rusper.

LÆLIO-CATTLEYA PIZZARO.

A handsome and large-flowered hybrid derived from Lælia Jongheana and Cattleya Dowiana aurea. The flower shown was large, well-expanded, and substantial. The ample sepals and petals are of a deep rose-purple colour, while the large lip is dark orange, veined and shaded with deep purple. A.M., R.H.S., March 3; Mr. H. Alexander, orchid grower to Major G. L. Holford, Westonbirt, Gloucester.

SOPHRO-LÆLIA FELICIA.

This is one of the largest-flowered of the sophronitis hybrids, and its parents are Sophro-lælia Heatonense and Lælia præstans, therefore, it is a secondary hybrid. The shape of the flower at once suggests the sophronitis, but the flower is three inches or more across, flat, and deep rich magenta-purple, with deep crimson-purple lip. A.M., R.H.S., March 3; Messrs. Charlesworth and Co., Heaton, Bradford.

HELLEBORUS PETER BARR.

An effective oriental hellebore, and a very free-flowering one, carrying numerous shapely flowers of a bright marone-purple colour. A.M., R.H.S., March 3; Messrs. Barr and Sons, Covent Garden.

CHIMONANTHUS FRAGRANS

This deliciously scented winter-flowering shrub is worthy of wider culture than it receives, as it comes into flower during the dull months of the year. It is evidently at home in a fairly light and well-drained soil. We have it growing near a north-east wall, in which position it does well. It is mostly seen with short twiggy shoots on which the flowers are produced, but its usefulness and beauty are greater when the plant produces strong shoots, as these enhance its usefulness.

We have been cutting branches several feet in length, and these, placed in trumpet glasses, with a spray or two of evergreen, give a delightful perfume in a room. There is no comparison between such flowering shoots and those small shoots of several inches in length, which are only suitable for shallow bowls.

We find that after flowering fairly close cutting back is the best way of inducing the plant to make these strong shoots. Even if deciduous, all sweet smelling shrubs are acceptable during winter, and doubly valuable if the flowering shoots can be cut of good length. T. H. Slade.

Poltimore Gardens.

LEUCOJUM VERNUM.

It is a pity the Spring Snowflake is not utilised more than it is as a companion to the earliest spring flowers of our gardens. Many years ago, staying in Poland through the winter, I saw in February a beautiful colony of L. vernum on the slope of one of the outliers of the Carpathian mountains. For a large space the grass was intermingled with the shining green foliage of this plant, surmounted by innumerable clusters of snow-white hemispherical bells as large as a shilling and with the tips of the petals delicately tipped with green à la snowdrop. Each stalk, about six or eight inches high, bore two or three of these bells, reminding one rather of huge lilies-of-the-valley. Although naturally bulbs were unavailable at the flowering period, friends on the spot collected some for me later, and sent me a bag full. That is some 15 years ago, but ever since, early in February, I am gladdened by the appearance of three clumps of these, with their characteristic flowers, though, owing to a purely suburban environment, I rarely get more than one flower on a stalk, despite which there is a sufficient number to form a very pretty and desirable group. The whole time they have taken care of themselves, having only been shifted once when removal took place to another house and garden. Leucojum æstivum, the Summer Snowflake, is far less attractive, being taller and more straggly, and with much smaller flowers. The two must not be confounded. C. T. D.

CORONILLA GLAUCA.

Coronilla glauca is one of the most useful plants we have for brightening up the cool greenhouse at this period of the year. Its beautiful yellow and fragrant flowers make it a most desirable plant. The treatment necessary is precisely the same as the genista or Cytisus racemosus needs, but the coronilla is a trifle the hardier, and will bear rough usage patiently, and it may be fairly said that whoever fails to keep it for some years, and to have at least one display of its flowers annually, either has very much to learn in the way of plant growing or is wanting in genuine love for plants.

The glaucous coronilla, like the golden greenhouse broom, is a free-growing shrub that attains to considerable dimensions if encouraged to grow, and kept from harm in the winter. Severe frost will certainly kill it, but a light one will do it no harm, and it may be exposed to the weather with advantage during six months of the year. To obtain young plants, cuttings may be struck at any time during the summer; young shoots should be selected, as the hard wood does not serve the purpose. If dibbled into sandy soil, pressed firmly, and covered with a bell-glass, they soon form roots, and may then be put into small pots in any light loamy soil. When the small pots are filled with roots the plants should be shifted into pots one size larger, and in these they should remain for the winter, and the proper place for them is a light airy greenhouse. They are very accommodating; they will thrive in peat or loam, but the soil should be substantial, and there should be about a sixth part of sand added, and there may be added also about a fourth or fifth part of decomposed hotbed manure.

To secure handsome specimens the plants should be carefully pruned as soon as flowering is over. This is intended to keep them in shape, and to prevent them becoming unreasonably large. But they will do as well without pruning as with it, and if the shape and size are satisfactory, and some increase of size may be allowed, it is simply waste of time and waste of growth to prune them. Having pruned them, turn them out of the pots, remove some of the old soil, and repot in clean pots of the same size, and do not disturb them again until they are growing freely, then shift them into pots one size larger. Thus, before the growing season is over, you will have promoted a free growth, and if this is well ripened by sunshine and fresh air, and a slight diminution of the water supply, a grand display of flowers will be seen in due time.

I had for many years some fine plants of coronillas and cytisuses; they had the most simple treatment, were always in perfect health, and flowered superbly. When they grew somewhat too freely I kept them two years in the same pots without any fresh soil. But the routine treatment consisted in turning them out of their pots in the month of April and removing some of the old soil, and putting them back into the same pots, or into pots one size larger, and filling in with a mixture of equal parts of loam, leaf-mould and rotten manure. They were kept in the open air, on beds of coal ashes all the summer, and they usually flowered in spring and in autumn, the spring bloom being the most abundant. T. B. Field.

Ashwellthorpe Gardens.

SOME CORNISH GARDENS.—II.

◆

During a tour of Cornish gardens it is borne in upon one that here in this favoured country is the home of the water garden and the wild garden. The moist atmosphere, the abundance of running water, and the genial temperature, all encourage this free style of gardening, while the lay of the land in so many of the larger gardens is a further inducement to practice this method. In but few gardens can one find a formal flower garden or any extensive plan of spring or summer bedding. There is, if anything, rather too much of the same kind of gardening, and in most places a little formality and some bold flower beds would serve as an excellent contrast to the freer methods, and give colour at a season when the spring-flowering and early summer-flowering subjects have yielded their wealth of bloom for the season. Cornish gardens are beautiful in a way of their own, and for those who live in less favoured districts they possess a long drawn out interest; but an attempt to follow their general style would, in many counties, end in hideous failure, even if hardier plants were used, simply because the atmospheric conditions would not be so suitable as they are in the Duchy, where "all our trees are shrubs, and all our shrubs are trees."

Carclew.

About half-way between Truro and Falmouth, and on the southern bank of the deep and broad Restronguet Creek—the valley with the deep promontory—lies the Carclew estate, with its extensive and finely wooded park. The nearest station is Perranwell, and not very far distant are the Gwennap Mines. Carclew has for some time been the residence of the Tremayne family, and the present proprietor is Captain Tremayne.

The garden proper occupies a valley, with the mansion on the higher side, set amid fine trees, and with the gardener's (Mr. Simmons) house nestling behind rhododendrons on the other side. The kitchen garden and the glass department are close to Mr. Simmons' house, and the glass houses are more important at Carclew than in many Cornish gardens. Allamandas are splendidly grown in the stove, and Cæsalpinia (or Poinciana) pulcherrimma is a feature of this house. This is cut hard back each year, and then grows vigorously, and produces its handsome red and yellow flowers freely. This species is by no means common in gardens; it has roundish seeds, and these only take two days to germinate. Carica Papaya does well here, and Stephanotis is particularly fine. Plants and indoor fruits are well managed, and the conservatory is always well filled, so that, in addition to the hardy plants, there is much of interest at Carclew.

A part of one side of the valley is terraced, and the levelled spaces are so many different gardens. The glass houses already referred to occupy the highest point. Sheltered by one of the walls there are large plants of Clianthus puniceus, Coronilla glauca, Mitraria coccinea, Carpenteria californica, Cantua dependens, and a very large Rhyncospermum jasminoides. Swainsonias stood out of doors unprotected for four years, but they were cut right down in the winter of 1906-7. The pretty blue-flowered Australian liliaceous plant, Dianella lævis, has been a success at Carclew, though unprotected during two winters. Lapagerias are common wall climbers in the shadier places. Pleroma macrantha has stood out against a wall, but has not yet flowered in the open.

CEDARS, RHODODENDRONS, AND WATER GARDEN AT CARCLEW.

A little lower down the valley slope the rose garden is planted, and from it a charming view of the water below and the splendid rhododendrons and camellias beyond is obtained. Further along this terrace are to be found Paulownia imperialis, a large Myrtus (Eugenia) Luma apiculatus, Abies Albertiana, 90 feet high; Sequoia sempervirens, 85 feet high; and Cletha arborea in fine form. In a little border the interesting Tricuspidaria dependens, a Peruvian plant, has flowered, and it is regarded with special pride.

The lower garden at Carclew is very fine. On either side are glorious rhododendrons and camellias, with winding walks in among them. There are big trees here and there, and many large ones on the higher ground above. Right in the bottom of the valley is an open space that holds a formal pond, with its ornamental boat and tea house at one end. Herewith are two views of this water scene, one showing the famous Lucombe oak, that was planted at Carclew years ago; it also shows the rhododendrons overhanging the water. The second view shows the water lilies and pampas grass, and the noble cedars and rhododendrons beyond.

Seedling varieties of Rhododendron arboreum abound, and they are fine plants, indeed in most cases care has been taken to keep all these fine Himalayan rhododendrons shapely, by occasional pruning, and by allowing each plant room to develop. Overcrowding is a sin as common in Cornwall as elsewhere, but it has been avoided at Carclew. The principal species and varieties of rhodendrons so successfully grown here are R. arboreum, R. Shilsoni, R. Hodgsoni, R. Sir Charles Lemon—a lovely white variety; R. Thomsoni, R. Falconeri, a splendid specimen; R. Aucklandi, raised from seed; the yellow-flowered R. campylocarpum, figured herewith; R. Manglesi, a hybrid between R. Aucklandi and

R. album elegans; the glorious R. Beauty of Tremough; R. Lucombei, a hybrid between R. Fortunei and R. Thomsoni, and probably raised here; R. eximium, a huge-leaved variety of R. Falconeri; R. campanulatum, a grand plant, with very handsome foliage; the rose-coloured R. Fortunei; the splendid R. grande, bearing great trusses of whitish blooms; the curious red and yellow-flowered R. Keysi, from Bhotan; the interesting R. Roylei; a scarlet-flowered form of R. Aucklandi; and the Chinese R. Fordi. This does not exhaust the list, but it gives the principal and most distinct species and hybrids. Certainly Carclew possesses one of the finest collections of these rhododendrons to be found in the country, and the collection is well cared for, and a credit to Mr. Simmons, who has so long had charge of them. There is one huge R. arboreum, with an immense trunk, and its spreading branches have long since extended right across the pathway at one point, so that you pass under the tree, and can only see its fine proportions when you look back from close to the pond.

All around this lower garden are sheltered nooks, and in every one of these there is something of special interest. There is a little fern dell, where Dicksonia antarctica and Cyathea dealbata thrive, but the nook is so enclosed, and the plants so large, that it was a practical impossibility to photograph the group. One other little nook is filled with polyanthuses, and another with lily of the valley. Close by is Azara microphylla 20 feet high, an Embothrium coccineum nearly 40 feet high, and a huge Choisya ternata that was a small plant in a pot twenty years ago, but it now a magnificent specimen 21 feet in diameter.

THE LUCOMBE OAK, AND RHODODENDRONS AT CARCLEW.

The tree pæonies are also a feature of Carclew, and they are planted on the slopes of the lower garden, and they must look fine in summer time, when they produce their big glowing flowers. Ginkgo biloba, the Maidenhair Tree, and the deciduous cypress, Taxodium distichum, are also fine in the lower garden.

Passing out of this little wonderland, and joining the drive where it comes through the park and ascends to the house, another good bit of free planting comes into view. Here is an old water wheel, formerly used to raise water, but now only a picturesque reminiscence of the past. There is a fairly deep gorge, with a stream broadened out into a lake at its foot, and all along the slopes are great breadths of mollis and Indian azaleas, and of the best of those Rhododendron arboreum seedlings that spring up so abundantly in the garden behind. Bamboos have been also freely planted, and there are some fine gunneras and big colonies of Arum lilies at the water's edge.

At Carclew one gains the impression that Captain Tremayne and Mr. Simmons are steadily extending the garden into the park and woodlands around, and not the impression that comes all too frequently after inspecting many gardens, that the park and woodlands are being allowed to extend into and encroach upon the garden proper. I hope to visit Carclew again some day.

Trebah.

Several miles south of Falmouth the Helford River discharges itself into the sea. Like the other Cornish rivers, it is wide-mouthed, and the waterway branches out into innumerable creeks and backwaters, the whole of the valley making up a very charming and peaceful scene in spring and summer, but, towards Mawnan, during the winter the scene may be a terrible one.

Many estates overlook this pleasant river, and one of these is Trebah. Another is Bosahan, on the south side of the river, and concerning which I shall have something to say on a future occasion. Trebah, the home of C. H. Hext, Esq., is charmingly situated in one of those gigantic hillside depressions that slope sharply to sea or river, and that are a so common and beautiful feature of Cornish scenery.

The house was undergoing repair at the time of my visit, but the builders could not hide the glory of Passiflora kermesina, Tacsonia Van Volxemi, and Cassia corymbosa, with which it was mostly covered. The house commands fine views over its gardens and fields, and over the river. The sides of this valley garden are finely wooded, and splendidly sheltered from the north, east, and west; broad pathways are cut along its slopes, and all along under the trees daffodils, snowdrops, bluebells, and primroses carpet the ground, and in their several seasons give delightful displays. By the streamlet in the bottom of the valley are any number of arums, colonies of Primula japonica, and some big gunneras.

Near the house, on the lawn, are three large specimens of Dicksonia antarctica, a very fine Exochorda grandiflora, a big juniper, a number of graceful bamboos, and, farther down, several stately cordylines or dracænas. Formal gardening does not find a place at Trebah, and it is not missed; indeed, the informality of these Cornish gardens, and their fine collections of rare trees and shrubs are their chief and interesting features.

The right-hand side of the valley, passing riverwards, is the garden side, and here, in sheltered recesses, are little gardens that form picturesque and interesting surprises. In one of these there are splendid masses of Lomaria procera, and a mass of Woodwardia radicans, 25 feet across, many of the huge drooping fronds measuring 10 feet long. This occupies a position on a bank, which it clothes in a graceful manner. Musa japonica does well here unprotected, and there are three plants of the more tender Musa ensete. Streptosolen Jamesoni lives here unprotected, and arums thrive beneath the taller bananas.

Another of these little side gardens contains several fair-sized examples of Dicksonia antarctica, a good Cyathea dealbata, and also a sturdy plant of Cycas revoluta. Around this recess Benthamia fragifera flourishes, so that within a small space there are grouped plants from Australia, New Zealand, China, and Nepaul.

On the lower slopes rhododendrons do well, and I understand from Mr. Thomas, the head gardener, there are several arboreums from 12ft. to 18ft. high now out with hundreds of blooms on them (March 9, 1908). On the other side of the valley, coming down quite close to the water, splendid masses of the common laurel were just coming into flower at the time of my visit, and the difference between these huge specimens, clothed with large deep green leaves, and bristling with flower spikes, and the smoke-begrimed and closely-cropped plants one sees so frequently in the neighbourhood of large towns, was very remarkable.

Trebah has its magnolia garden, and this must provide a pretty picture in the early summer. Here, too, are Daphne indica and Banksia quercifolia, and behind, on the higher ground, is a fine plant of Acacia longifolia, and a beautiful tree of Acacia dealbata over 30 feet high, that is a glorious mass of graceful golden florescence in the early springtime. Cyclamen hederæfolium covers the grounds in many parts of Trebah, flourishing beneath evergreen oaks.

A fine pair of trees of Thuia Lobbi, and a handsome Cupressus macrocarpa lutea 20 feet high, attract attention ere this valley garden ends in an extensive orchard of apples and pears. Passing through this, and over some meadows, one reaches the high cliffs that keep the Helford River within bounds.

Enys.

Enys, beautiful Enys, lies within easy reach of Penryn; indeed, it is about halfway between Penryn and the Carclew estate. Penryn, famous for its granite quarries, is almost as good a centre as Falmouth for anyone who wishes to see a number of good Cornish gardens, but it has not the attractions or the romantic associations of Falmouth. Londoners may remember, however, that Waterloo Bridge is built of Penryn granite.

The owner of Enys is J. D. Enys, Esq., who takes much interest in his fine estate, and his home steward and gardener, Mr. Hogbin, is a keen horticulturist, while the foreman gardener, Mr. Frost, is a skilful cultivator. Small wonder then that Enys is not merely a big estate, with fine woodlands and pastures, and a garden, but is a garden of many gardens. I was fortunate in finding Mr. Hogbin at home, and under his guidance a very pleasant afternoon was spent in exploring the extensive grounds, the extensive water garden—the Enys Ponds, the admirable farm and stables, and part of the splendid beech and oak woods. Timber is well managed at Enys.

From whatever side Enys is approached the visitor must pass up very long drives, and cannot, as a consequence, fail to notice how unusually well-wooded this estate is, as compared with many others in the district. I was told that one small wood, fortunately quite isolated, is the home of innumerable starlings. Time and again efforts have been made to materially reduce their numbers, but with very little success, and it would appear that nothing short of levelling the wood will disperse them.

Along the nearer approaches to the house rhododendrons have been planted extensively, and in spring the view from the front door is especially fine, by reason of the splendid trees and great banks of arboreum varieties that are literally smothered with big trusses of effective blooms. The garden front of Enys House is treated with some measure of formality. The lawns are on a higher level than the park, and separated from it by a low wire fence, and retaining walls. There are groups of mollis and Indian azaleas, and a small set of flower beds in the centre, surrounding a small temple of Crimson Rambler roses. Spring flowers, notably daffodils, tulips, wallflowers, and polyanthuses are made a feature of here, and over these fragrant and beautiful flowers Mr. Enys can, from his favourite window, obtain a fine view across the park beyond.

In what part of the estate, relative to the house, the various gardens lie, I do not know, because, in spite of a fairly well-developed bump of location, I confess to have lost my bearings at Enys. But this matters little, as a request for admission is rarely denied to a horticulturist, and a visitor will prefer to see the gardens rather than study a plan of it. It may be at once stated that Enys possesses a very fine walled-in kitchen garden that bears ample evidence of good cultivation. The glass department is a fairly extensive one, and its upkeep bears testimony to the good relations existing between employer and gardener. It is at some distance from the house, and in the conservatory the largest batch of Rehmannia angulata I have seen was flowering. Brugmansias or daturas were also a noteworthy feature. The vineries were interesting because in several of them the vines are grown under express culture. They are grown on freely and well ripened one year, fruited heavily the second year, and then pulled out. In the peach houses the unusual method of growing standard trees in the border, instead of up the roof, is practised with great success.

Under the conservatory wall the Belladonna Lily flourishes, and in a garden close by there is a collection of rarities that would delight the heart of most plant lovers. Some rare old branched examples of Cordyline australis occupy a central position, and here and there are some big specimens of Agave americana. At the end is a splendid Phœnix canariensis, 12 feet high, and with frond-like leaves 12 feet to 15 feet long, the picture of health, and yet it is never protected.

In the beds are numbers of those plants that one goes to the Temperate House at Kew to inspect. Daphne indica and D. i. rubra dispense their fragrance all around. On the wall is a beautiful specimen of Berberidopsis corallina, with the Chilian Rhaphithamnus cyanocarpus as a near neighbour. Grevillea alpina is 2½ feet high, and G. rosmarinifolia rises 8 feet high. Eucalyptus cordata and Corokia buddleoides, a yellow-flowered New Zealand shrub, are near neighbours.

Further along in this garden one finds Celmisia Munroi, the elegant Lagerstrœmia indica, Clianthus puniceus flowering finely against the wall, the elegant Grevillea Thelemanniana, Correa speciosa, Tricuspidaria splendens (Crinodendron Hookerianum) 5 feet high, coming into flower, and the rare, small yellow-flowered Rhododendron anthopogon. Leptospermum myrtifolium, a white-flowered myrtaceous plant, from Australia, rises to a height of 8 feet, while skimmias and Desfontainia spinosa are common plants here and in other parts of Enys, the latter making big bushes and producing its scarlet and yellow flowers freely during summer time. Of Trachycarpus excelsa, large or small, one takes little heed, or even of the colony of Crinum Moorei in a narrow border. But Citrus trifoliata is a big bush, and the climbing hydrangea—Schizophragma hydrangeoides, clambering up a mespilus, are rather out of the common, while Photinia serrulata, a close relative of the Japan medlar or loquat, fills up a big corner, and is about 34 feet across.

RHODODENDRON FALCONERI AT CARCLEW.

There is a very interesting border of plants outside the kitchen garden wall, and near to the rock garden, where hardy ferns flourish in the moist atmosphere and the genial shade of tall trees. In this border a few of the prominent plants are Magnolia Lennei, 20 feet high, Rhododendron calophyllum, R. Roylei, a fine R. Falconeri, R. grande finely in flower, some of the choicer forms of R. arboreum, fine plants of Erica codonodes, and among them all the stately Lilium giganteum is a great success.

The giant Chatham Island Forget-me-not. Myosotidium nobile, is one of the many things well managed at Enys. It is planted under a north wall, and the three dozen clumps of this herbaceous perennial are worth going a long way to see. It is liberally treated, and responds nobly to that treatment. Shortia galacifolia and Soldanella alpina are lowlier plants of great beauty that are perfectly at home at Enys.

DICKSONIA ANTARCTICA AT CARCLEW.

Leaving these and many another very interesting and beautiful subject, one passes on to the ponds, noting by the way a fine Pittosporum undulatum 40 feet high, and, sheltered by a cupressus, a fine example of the deliciously fragrant Drimys aromatica.

Nature and art have combined in pleasing fashion to open up the Enys Ponds and make them beautiful. They are really a series of small lakes, the one opening out from the other. All are set in a dense woodland, and the whole forms a very beautiful water garden, views of which have already appeared in these columns. Masses of rhododendrons are grouped irregularly all along the water margin, and here and there they dip into the water. Gunneras thrive here as they do in few places, and one leaf has measured 10 feet 4 inches across. The giant osmundas, with their feet in the water, make splendid growth, and bamboos are ever green and graceful. The little bays have their colonies of water lilies, these sometimes extending far out into the lake. Arum lilies and irises abound, and reeds and pampas grass have their allotted positions.

The slightly formal pond at the head of the series has also its special interest. Along one side of it a path runs beneath the overhanging branches of trees up to a rustic summerhouse. Between the path and the edge of the water is a colony of Primula japonica, and this colony is from 3 feet to 4 feet wide, and 150 yards long! From the summerhouse these primulas present a very fine and unique picture when they are in flower. They seed with the utmost freedom, and thousands of seedlings have to be hoed up each year on the path.

Another feature, the concluding one for the present, is the fine pair of plants of what is known as Cordyline indivisa vera. These are at some distance from the ponds, and they stand, backed by C. australis, in a groundwork of hardy ferns. They are about 12 feet high, and, as the illustration shows, are finely furnished with broad handsome leaves.

Penmorvah.

Only a few yards from the entrance to Penjerrick stands the entrance to the Rev. Ed. Hensley's very interesting little garden. The place is named Penmorvah. It was quite by accident I called on the reverend gentleman, but, when driving past with my friend, Mr. Gill, the latter suddenly pulled up with the exclamation, "Have you seen ferns growing in soda water bottles?" I replied that I had seen many a one, but he again asked, "Have you seen them by the hundred together?" To this I had to give a negative answer.

The owner, and his very enthusiastic gardener, Mr. Ould, were as delighted to show off their treasures as I to inspect them, and let me say that Penmorvah, with its six acres of garden and orchard, is one of the best kept places I saw in the Falmouth district. Larger gardens contained rarer trees and shrubs, and finer scenery, but for smart up-keep Penmorvah is more after the style of the better gardens in the home counties and northwards.

Mr. Ould is quite a character. He is a born gardener. He has not been to Kew, or Chiswick, or Swanley, or Wisley, or other seats of horticultural learning, nay, he has scarcely heard of them, but he knows how to garden all the same. With the partial help of one other man he not only keeps Penmorvah's six acres trim and neat, but he grows excellent vegetables in plenty; his fruit trees are the picture of health and fruitfulness; his little plant houses are well stocked; his frames of violets are a treat to inspect; and his three little vineries yield well over a thousand bunches of grapes per annum. I fail to understand how Mr. Ould gets through the work, but the garden is evidence of his ability and thoroughness. He also has some hobbies, and bottled ferns and tame fish are among them.

It was by accident that Mr. Ould found ferns would grow inside an upturned soda water bottle, and so he set to work, and selecting tiny seedling hardy ferns, chiefly scolopendriums, he planted one in the neck of each bottle he could secure, turned the bottle upside down, and buried a third of it in the soil, and in this fashion he has edged a part of the kitchen garden with bottled ferns. There is a small, round pond, with an edging of ferns, and a few water lilies, and it is inhabited by gold and silver fish. Mr. Ould has only to whistle softly and the fishes crowd to the side of the pond next to him, to be rewarded by a few crumbs.

Most of the trees at Penmorvah are of Mr. Ould's planting, and he is as proud as his employer of a group of Picea pungens glauca, of a fine Araucaria excelsa, Pinus insignis, and Cupressus macrocarpa. There is a very big fig tree near the glass houses, and the wall fruit trees would do anyone great credit.

In the pleasure garden there is a very fine Desfontainia spinosa, while roses are

PART OF THE FLOWER GARDEN AT ENYS.

a great success. In different parts of this garden are two rose temples, one almost wholly covered with Crimson Rambler, and the other with a variety of strong-growing climbing varieties.

The whole garden is prettily laid out, lawns, evergreen and deciduous trees, roses, herbaceous plants, fruits, and vegetables all occupying their rightful positions, and the house itself is well clothed with various creepers. Penmorvah is, to use a feminine expression, a little love of a garden, and Mr. Hensley and Mr. Ould are to be congratulated upon its admirable upkeep.

Charles H. Curtis.

HARDY SHRUBS UNDER GLASS AT KEW.

Although some of our hardy shrubs have for many years been forced prematurely into bloom for the embellishment of the greenhouse or conservatory, their popularity has increased of late, and we now find a greater variety of subjects so treated than was at one time the case. At the end of February and early in March forced shrubs of different kinds contributed largely to the display in the large greenhouse (No. 4), and in the Temperate House, quite large bushes of some of them serving to lighten up the latter structure in a remarkable manner.

A BEAUTIFUL WATER-GARDEN SCENE AT ENYS.

Rosaceous plants are, as usual, strongly represented, particularly noticeable among them being Spiræa arguta, which is one of the very best shrubby spiræas for the open air as well as for forcing. A second species, Spiræa prunifolia flore plena, has the leafless branches wreathed for some distance with clusters of pure white double blossoms, whose clearness of tint is intensified by contrast with the dark-coloured bark, which, in some instances, is almost of a blackish hue.

That delightful member of the cherry family. Prunus pseudo-cerasus roseo plena has very large double flowers of a delicate pinkish tint, while the dwarf-growing Prunus japonica, known also by the specific name of sinensis, has two charming double-flowered varieties, one pure white, and the other tinged with pink. In any selection, however limited, of plants for forcing, Prunus japonica, as represented by one or other of its double forms, is certainly entitled to a place. Prunus triloba, with double pink flowers, varying in depth of colouring according to the amount of exposure they have received, is fully recognised as most desirable for forcing, and large numbers of it are grown every year for the purpose. The double peach, represented by a rich rose-coloured form, is very conspicuous in the Temperate House. Pyrus floribunda, which, when out of doors, has such bright coral-red buds, is under glass almost white, but is even then very pretty, and exceedingly floriferous. The last of the rosaceous plants to mention is an old and well-known inhabitant of our gardens, yet it is not often employed for forcing, though it has been treated in this way at Kew for years. I allude to the ordinary double-flowered Kerria japonica, whose blossoms, like little yellow roses, are borne in great profusion. The bright green of the bark is, indoors or out, a notable feature of this kerria.

Next in quantity to the rosaceæ comes the different members of the rhododendron family, with which the azaleas are now included. Rhododendron Cunningham's White, or caucasicum album, is in some nurseries grown in large numbers for forcing. A group of it in No. 4 greenhouse shows its suitability for this mode of treatment. The deciduous Rhododendron (Azalea) sinensis, which, by the way, is better known as Azalea mollis, is represented by several kinds, varying in the tint of the flowers and in other respects. The rich orange-coloured Anthony Koster is one of the best of all. In addition to these the small-flowered forms of Rhododendron (Azalea) indicum may, in many districts, be regarded as hardy shrubs. Especial mention may be made of R. obtusum, with salmon-red flowers, and its variety album, as well as one of the amœna hybrids, viz., Illuminator, with deep purplish-magenta coloured blossoms.

Beside the above there were Viburnum opulus sterile, the guelder rose or snowball tree, so striking and distinct from anything else; Jasminum primulinum, which in many places at least is more of a success under glass than it is in the open ground; lilacs, including that pure white and extremely floriferous Marie Legraye; Staphylea colchica, whose blossoms are agreeably scented; Cytisus præcox, and Cytisus scoparius Andreanus, two charming brooms either in or out of doors.

Wistaria sinensis is, according to our nurserymen, becoming year by year more of a favourite for forcing, and this need not surprise anyone, as it supplies a welcome change in colour, and when grown as standards in the contour of the plant also. Lastly, must be noted the forsythias, so soon to make an outdoor display. For medium-sized plants Forsythia intermedia can be recommended, while quite large bushes of Forsythia suspensa in the Temperate House form masses of yellow flowers, and associated with dark-coloured evergreens they stand out conspicuously.

K.

Saccolabiums, and the allied genera Rhyncostylis, are also best grown in baskets. There are many beautiful and interesting plants among these that are worthy of every consideration. The potting requirements are the same as for vandas, but the fleshy-rooted kinds should not have too much compost about them.—H. J. Chapman, Oakwood Gardens.

ADVANTAGES OF THE ORCHARD HOUSE.

Those who have seen the choice collections of forced fruits displayed at the best of our summer and early autumn shows have had direct evidence of the great value and purpose of the orchard house, for there is no doubt that much out-of-season fruit exhibited is produced in such structures. The very fine apples, pears, plums, cherries, peaches, nectarines, apricots, and figs exhibited bearing the stamp of superior culture which only the protection of glass affords. Not only is there fine external appearance, handsome proportions, and bright clear skins, but there is an accompaniment of high quality in these fruits.

The title "orchard house" is often given to structures allotted to peaches and nectarines only, but a broader view is that under which the title is now adopted. Such houses are often found without the means of heating, or the hot water apparatus is not pressed into very active service. The simplest form of house is accounted sufficient, although there are many costly erections doing service.

Beyond all doubt the span-roofed structure is that which affords the best conditions. Such a house affords light and air in a manner that can be provided by no other designs. Side openings are as important as those in the roof, and should be as near the ground line as possible, in order that the circulation of fresh pure air may reach the whole internal space. Peaches and nectarines are not so fastidious as are some of our more hardy fruits, hence the form of structure need not be so exacting in its detail for these. The best aspect is found to be north and south, as then the sun, in its day's course, benefits the occupants from sunrise to sunset. Such a house may be from sixteen feet to thirty feet in width, and fifty feet to sixty feet in length, with a ridge height of eleven feet, or slightly more. In a scheme calculated on covering a long season there would be an extension of length and a dividing up of the orchard house into sections, so that there are means for retarding in the one case, and hastening in the other, and all brought about by the daily adjustment of the ventilators.

In private gardens the boundary walls are often utilised for the erection of glass structures for all purposes, sometimes, indeed often, on the principle of economy. There are advantages and disadvantages to this rule; the advantages, however, on the year's working, would probably be found not so great in the lean-to as in the span. There may be more uniformity of warmth and economy of stored heat where this is applied artificially in the lean-to, but in the span running north and south there are solar influences which are of incalculable advantage.

PRIMULA JAPONICA BY THE LAKE SIDE AT ENYS.

The most critical period parhaps with orchard house crops is when the trees are passing through their flowering stage; if the house is neglected then in the matter of ventilation trouble is invited, because flowers set indifferently when the atmosphere is unduly humid. The general object of an orchard house is to provide fruits prior to their natural season, and especially are they valuable in cold or unfavourable districts. Then there is that superb finish and quality in the fruit which are denied to those who must need depend on more primitive methods.

The provision of heating apparatus is regarded by practical men as strictly economical and essential, since by its use in adverse weather critical periods may be traversed without anxiety, and without loss of time or material. If trees are exposed to frost during their period of blossom there is the danger of sterility. The means for heating, even if not required for general purposes, should be provided for. There are sure to be seasons when the heat will be advantageous, notably in dull and wet periods.

Though much may be said in favour of simple architectural designs in the orchard house, one envies the more elaborate design, where the roof is divided into short sections that may be raised at will by lever adjustments in such a manner that the trees can enjoy exposure to the elements almost to the full. In the autumn certainly such conditions are ideal, and conduce much to the full maturity of wood and bud. True, these same conditions can be provided by a plain roof having sliding lights removable at will, and it may be argued that quite as good fruit is produced under these conditions as when the more elaborate house is used. In a large garden, or even in a small one, the orchard house is a treasure, so long as it does not impose heavily on the limits of labour. With timely and rational attention at all seasons, both pleasure and profit are secured. The orchard house is no new thing. The Messrs. Rivers, of Sawbridgeworth, have become almost world-famous for their triumphs of orchard house fruits of every kind, and though they may almost claim to be pioneers, their practice is now followed by trade and private enthusiasts, and all have profited; indeed the wonder is that opportunities for the erection of orchard houses are allowed still to lie undeveloped, simply because of a mistaken regard for economy.

W. Strugnell.

Rood Ashton Gardens.

Everyone interested in a garden should obtain a copy of the Alphabet of Gardening, by T. W. ders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price 1s. 6d. net, by post 1s. 9d.; cloth, 2s., by post 2s. 3d., from W. H and L. Collingridge, 148 and 149, Aldersgate Street, London.

A GARDEN OF ANNUALS.

(Concluded from page 187.)

Mixed Borders.

It is not necessary to have massed beds of one thing; balsams, nicotiana, and salpiglossis (where it succeeds), for instance, being effectively treated as standards in beds carpeted with low-growing plants, such as lobelias, Sanvitalia procumbens, Dianthus Heddewigi, blue nemophila, and the various dwarf forms of French marigolds, antirrhinums, etc., and all these plants last as long in bloom as most bedding plants.

All mentioned in this section need fairly sunny positions, most of them doing best in full sunshine. Capital pot plants for indoors can be made of some of them, notably balsams, petunias, and verbenas, if grown in a cool house or frame.

We generally see annuals grown mostly in mixed borders unsatisfactorily, both starved and crowded, the result being thin spindly plants, which make a patch of colour, though with flowers of poor quality, for a fortnight or so, after which, the plants having few or no laterals to keep up a succession, their beauty is over.

Annuals cannot be grown well where they have to share the soil with the greedy roots of strong perennials, as the competition is an unfair one, the former getting an insufficiency of light and air, and, through the necessarily inadequate digging, and consequently restricted root run, being starved both in respect of food and water. But as we are speaking of a garden of annuals, we will assume for the moment that the borders are not occupied by perennials, and that annuals can be given good conditions.

The object should be to keep up a display for as long a season as possible, and for this reason some of our favourites, which are of rather short duration even with the best cultivation, must be reserved for another place. Many may be sown where they are to flower, but some are not quite hardy, some fall victims to slugs and other vermin, while others, though hardy, pay for a little nursing in their early stages. Among effective annuals which may be sown where they are to bloom are Chrysanthemum coronarium, C. carinatum—the wild C. segetum being worth a place—Coreopsis bicolor, scabious, stocks, godetias, clarkias, Eschscholtzia californica, larkspur, sweet peas (best in groups of two or three plants of the same colour), lupins, sweet sultan, and calendula. Other very desirable plants for the borders best raised in heat or in a frame early in the year are gaillardias, pentstemons, Iceland poppies, and antirrhinums, the first two giving a very fine and prolonged display through the later summer and autumn.

Climbers.

We must have climbing annuals for arches, pergolas, fences, buildings, tree stumps, etc. There are several desirable ones among the annuals, the one thing necessary being early raising, so as to have them well up before the summer is too far advanced. Even the common climbing nasturtium and the canary creeper are best raised in a frame in pots, and planted out without disturbing the roots, towards the end of May. There are few climbers more beautiful than the Chilian glory flower (Eccremocarpus scaber), which, sown in February, will run ten feet high by the end of July, producing clusters of coral flowers. Maurandya Barclayana is more tender, but it produces a good mass of growth, with numerous delicate mauve flowers, by August. Cobæa scandens is another similar to the last. Of quite a different character are the gourds, which, when well grown, produce a striking effect. All the above are tender. For damp and shady places the canary creeper is about the best annual climber than can be grown, but the tall tropæolums and Convolvulus major also do well, the latter being especially beautiful in the shade in the early morning.

DRACÆNA INDIVISA VERA AT ENYS.

Cut Flowers.

Any garden is sadly incomplete without a part specially devoted to the growth of flowers for cutting, and this is especially true in small gardens, where a slight raid leaves its mark on beds and borders. Annuals can provide us with almost everything we desire in this respect. Given a border in the vegetable garden, or one or two beds three or four feet wide across the vegetable quarters, and gorgeous effects can be obtained, with an unlimited supply of material for cutting. Apart from sweet peas—of which, by the way, we do not want too many, as it is such a labour picking off the seed pods, and without this they soon flag—we might grow in this reserve garden Shirley Poppies, cornflowers (untidy plants in the flower garden proper), scabious, Eschscholtzia californica, love-in-a-mist, larkspurs, miniature-flowered sunflowers, sweet sultan, Coreopsis bicolor, annual chrysanthemums, gaillardias, Iceland poppies, Cosmos bipinnata, African marigolds, and others too numerous to mention.

Some of these are of long duration, but those that are of shorter life should be grown near each other, so that they can all be cleared off together as soon as they get untidy, and the ground used for something else.

Shady Places.

There is one respect perhaps in which annuals are deficient, and that is, very few are adapted for growing in shady places. Stocks, however, will do fairly well, and also asters, lupins, and pentstemons, if accompanied by a fair amount of moisture and good cultivation. Antirrhinums, on the other hand, will succeed in the shade if not too wet. There are two things which should be grown in various odd places in every garden, and these are mignonette and night-scented stocks, the latter, though an ugly little plant by day, scents the garden for yards all round it in the evening. Both do fairly well in the shade.

It has been assumed that all the plants mentioned above will be treated as annuals, that is, sown in the spring, but many of the hardy ones, even those which are true annuals, will make finer plants, produce a better display, and come into flower earlier in the summer, if sown in the previous August or September.

Sowing.

With spring-sown hardy annuals many get poor results through not sowing the seed soon enough, early March being a good time if the ground is in good working order and slugs are not troublesome.

Another reason why poor results are often obtained is the fear of having the plants too thin. It often looks like the ruin of a bed of Shirley poppies when the little plants are thinned out to eight or nine inches apart, but it is not at all too much room to allow them if the soil is good. Failure to afford support before the plants begin to fall down spoils the appearance of many a bed of annuals. Watering is yet another reason why results are sometimes so disappointing. Frequent sprinkling of the plants in their early stages induces surface rooting, and causes them to succumb very quickly to the heat of July. It is much better to keep the surface loose, and, as summer approaches and the plants begin to cover the ground, to put a mulch of short manure over the soil between and around the plants, and then, if very dry weather comes, to give them one thoroughly good soaking, and leave them, such a watering lasting a fortnight in the hottest weather if the plants have a deep root run. Alger Petts.

CLERODENDRON TRICHOTOMUM.

This very beautiful shrub or low-spreading tree has won for itself the reputation of being somewhat tender, but one can recommend a more extensive trial before thus condemning it, for one meets with many flowering examples in the east of England that, provided with fitting shelter, prove as hardy as the rank and file of trees and shrubs, and more attractive than most. It has soft, pithy wood, broad pale green leaves that recall polygonums, and the flowers in early autumn scent the air for yards around. They are produced in rounded hoya-like clusters, each cluster six inches or more across, and the flowers individually are white, with conspicuous purple calyces that help immeasurably to render the trees attractive at a distance. An attempt to grow it in a wind-swept garden or in exposed areas would undoubtedly fail, but if grouped in the middle of a laurel clump, or used to fill up a gap caused by the decease of a low tree, providing shelter all round, it would thrive.

Mr. G. Davison has a splendid example at Westwick, which I take to be ten feet to fifteen feet through, and when in flower it is one of the best features of that celebrated garden. Culturally, it is akin to ailanthus; it does not mind fighting for its living in competition with other shrubs, provided these shelter it. It has the soft wood of ailanthus, a similar stoloniferous outcrop at the base, and it can be grown and used in quite similar ways, the growth of both trees being singularly identical. One can rear a large stock of trees by cutting out the stolons with roots attached, or by forming "vine cuttings" of the ripened wood, rooting these in autumn under glass, and giving them the treatment of vines till strong enough to be planted under shelter in the shrubberies.

G. B. Mallett.

Glass Over Seed Pans.—At this time of year the gardener who is not overworked is somewhat of a white elephant, therefore I am sure that scores will thank me for reminding them what a saving of labour may be effected by covering each pot or pan of seeds with a close fitting pane of glass. Evaporation of moisture is thereby reduced to a minimum, so that water is seldom needed till after the seedlings are well through the soil. A handful of damp moss on the glass is a further aid, and it also assists germination by keeping the pan dark.—E. J. K.

A QUESTION FOR FRUIT GROWERS.

A question which aroused the interest and the close attention of the members of the French (Paris) Academy of Medicine at a recent meeting certainly merits the careful consideration of all fruit growers, and, indeed, all thinking men and women.

The subject was broached by a well-known Lyons professor, Dr. Cazeneuve, who has doubtless made a close study of it. The professor called attention to the fact that the vignerons of Southern France had, in the majority of cases, adopted the habit of using arseniate of lead for the purpose of destroying mildew and insects on the vines. The mixture was most efficacious for the purpose for which it was used, but Dr. Cazeneuve emphatically stated that traces of arsenic and lead were found in the wines made from the produce of these vineyards.

Of course, the percentage of the poison to the quantity of wine tested was very small, but, in the doctor's opinion, enough to constitute a menace and a danger to the wine-consuming community. Six months or less would, he considered, be sufficient (of moderate drinking) to poison the stomach so as to seriously endanger the system, therefore the continued use of the poison by the vine growers provided a danger of wholesale poisoning. It seems that the cheap wines are the ones which are most exposed to the danger, and that large quantities of these are consumed by the labourers of the wine-growing districts, and these labourers, according to the doctor, have a large percentage of their numbers suffering from arsenic and lead poisoning. The question debated seems to have taken a deep hold on the medicos, and the whole matter will be thoroughly investigated, and doubtless heard of again.

After this statement our own use of poisonous sprays and washes for fruits and vegetables needs consideration. Possibly during the time that fruit trees are dormant no danger is incurred, but to use highly poisonous washes on trees where fruit is set (even if it be but in its earliest stages) is surely a matter of risk. The readiness with which such washes adhere to leaves, stems, and fruits raises the question whether the matter is not retained on or in the fruit, even up to the ripening period. Of course, the danger is greater with indoor fruit, but the report from France shows that the danger is present, even with outdoor fruit.

The ever-growing output of chemical mixtures for the horticulturist's use have undoubtedly proved a blessing and boon to many, but for the safeguarding of the public health all the patent mixtures which contain poisonous ingredients should be labelled accordingly. On the other hand, growers who use poisonous washes, such as Bordeaux mixture and similar compounds, should be extremely careful regarding the use of these on growing crops. It would be wise, in view of the systematic spraying of tomatoes, potatoes, etc., if some means could be afforded of showing the amount of poison which remains on the fruit or foliage after the moisture has evaporated, and also the duration of time the same would remain without losing its poisonous qualities; also whether the poison is drawn into the flesh of the fruit or the tissues of the leaves by the action of the plants or trees under notice.

Look at it as one will, the subject is full of interest, and the grower who uses compound washes or poisonous mixtures should be fully aware of the nature and strength of what he is using. It will pay him to know as much as possible about the effect of the sprays, etc., upon his plants and fruit, and the more knowledge one can bring to his work the better will the consumers be safeguarded, and the more satisfactorily will the work be done.

P. S. Hayward.

HERBS.

It is rarely that large quantities of herbs are asked for at any one particular time, but a little of some one or other of them is required daily, so that, to keep up a constant demand, new beds should be made at intervals. I endeavour, so far as is possible, to keep all the herbs together, as this, it is needless to say, means a great saving of time for the one that collects them.

The ground for herbs requires dressing with good manure, more or less according to the nature and condition of the soil. If it has not been deeply worked then it had better be trenched at once. Most herbs require dividing, or to be sown, by the middle of April, and earlier if the weather is suitable.

Sage may be increased by seed sowing or by large slips put deeply in the ground and made firm; this latter method is mostly practised with good results.

Thyme may be similarly treated to sage. Small tufts, planted one foot apart, and made firm, soon grow to a good size, and both the common and lemon thyme may be increased in this way, or seed may be sown either in boxes or in the open in well-prepared beds.

Mint needs only to be lifted, pulled to pieces, and replanted, spreading out the pieces and covering them up with three inches of soil. Or young shoots, when about six inches high, may be pulled up and planted at one foot apart. If watered once or twice in dry weather these will quickly grow into very fine plants, and produce a large amount of serviceable mint.

Tarragon is very much asked for, and should be grown in larger quantity than many other herbs. It may be used in a dry state in winter, but it readily forces. I have more than once met with a variety under the name of tarragon, and although this greatly resembles it in leaf growth and appearance, it is practically void of flavour. Where such is to be met with it should be destroyed, and the right kind procured from a reliable nursery or some garden where it is true. I make up a fresh bed annually, and from this secure plenty of tarragon both for summer and winter use. It seeds but rarely. The plants divide readily, and the only protection needed in severe weather is a good top-dressing of short manure or leaf-mould.

Savory is another very useful herb, and should be grown in all gardens; only a small bed need be planted, as from a few plants a quantity of leaves and young shoots are produced. It is usually increased by seed or divisions.

Chervil ought to be sown at intervals during the summer months, so that the young leaves are plentiful. A few rows only need be sown at any one time. Chervil is mostly in demand early and late in the season.

Basil needs more warmth than most herbs, and should be raised in heat and planted on a warm sunny border.

There are many other herbs rarely asked for now, and these need hardly be grown. I have grown some kinds for years, and never been even asked for them; these I have ceased to cultivate, and immediately—such is the awkwardness of things—a new cook arrives, and they are wanted.

Wrotham Park. H. Markham.

MOON DAISIES.

For the border or for cutting the hardy chrysanthemums, commonly known as moon daisies, have become quite an extensive family.

Some persons now employ the term of Shasta daisies for the group, but why, it is a little difficult to understand, because, as far as I can learn, there is but one variety bearing this name, I think, raised by Burbank from C. nipponica, which is a Japanese plant, and a form of C. maximum. Therefore, I fail to see why the whole family should take the generic name of Shasta daisies.

Moon daisies can be divided into three types: C. maximum, from the Pyrenees; C. lacustre, from South-western Europe—this also bears the name of latifolium; and C. leucanthemum, also European. C. maximum is the parent of the early-flowering varieties, while the varieties of C. lacustre give late flowers that are equally as useful as the early-flowering type, although they are generally coarser in both flower and growth.

No hardy plants that I know are so accommodating either in propagation or in growth. If given a deeply dug and well-manured stiff soil freedom of growth is assured, and certainly a large number of flowers. Drought does not affect them in the same way as it does many hardy plants, hence their value for the border.

Propagation is easily effected by division of the roots in autumn or spring, according to the character of the soil. When this is of a sandy nature autumn planting is the best, but where heavy, cold, and retentive of moisture spring planting is advisable. Some few varieties, notably Li Hung Chang, are not so hardy as others, and are liable to be crippled by a severe winter. In such a case autumn propagation is desirable. Dig up the roots in October, pull them in pieces, and plant in sandy soil in a cold frame or in boxes, where, by the middle of March, they will be well-established plants, easily transferred to their flowering quarters. It is never wise to put out large plants; far better arrange several small ones in clumps, as they grow away more quickly, and are more easily supported in their growth during the summer.

In making a selection of varieties much discrimination is required to avoid duplicates, especially in the lacustre or latifolium section. As so many are almost, if not quite, alike, and many are now annually raised from seed.

C. leucanthemum is the ox-eye daisy, and C. Daviesi is the earliest of all to flower, opening its blossoms early in July.

C. maximum flowers abundantly during July and the early part of August. With liberal cultivation the type will grow from two feet to three feet high. C. m. filiforme, with its deeply serrated petals, which are long, and droop gracefully, is quite one of the best for border or vase decoration; it is two feet six inches high. C. m. Li Hung Chang (House) is far and away the best variety in this section. The growth is erect, stiff, compact, two feet high; the blooms are fully six inches in diameter. The florets droop gracefully at the tips, and are not set so closely together as in some varieties. I look upon this variety as quite the best of any section for the border or in a cut state. This variety may be a cross between the two species, maximum and lacustre. C. m. laciniata Robinsoniana has smaller flowers, with narrow petals, each one being elegantly fringed; this is a worthy variety, with stiff flower stalks. Its height is two feet six inches. C. m. Mrs. Charles Lowthian Bell is quite new, growing but twenty inches high, and flowering freely for a long time. C. m. grandiflorum (House) has narrow petals, with an extra deep golden disc. C. m. Distinction (House), with its narrow florets, is useful for cutting. C. m. Queen Alexandra (Barr) grows fully four feet high, and has extra large blossoms; the pointed petals droop gracefully at the tips. C. m. Monarch (Ladhams) is a gem, and should be in every collection; the florets are semi-drooping at the tips, the flower carrying a deep yellow disc. C. m. Goliath (House) is not so large as many of the moon daisies, but the blooms are of perfect shape, being quite circular; the florets reflex slightly at the tips, and the flowers are borne on long stiff stems.

C. lacustre is the marsh ox-eye daisy. C. l. Top Sawyer (T. Smith) grows five feet high, bears large blooms on stout stems, and the florets droop slightly at the tips. C. l. grandiflorum (Dickson) very much resembles the former variety. C. l. King Edward VII. is quite the largest moon daisy yet raised, growing nearly six feet high, and flowering profusely, but the blossoms are regarded by many persons as coarse. C. l. Moonlight has erect petals, forming cup-shaped blooms. C. l. Countess Cadogan is large, and spotlessly white.

The form of C. nipponicum, known as the Shasta daisy, commences to flower early; it is pure white, and has a deep yellow disc. The flower stems are slender, fitting it well for arranging with other flowers in vases. This variety has an advantage over others in that it sends up relays of new flower stems from time to time, and is, therefore, almost a perpetual in flowering.

E. Molyneux.

Swanmore Park.

RAMONDIAS.

Ramondia pyrenaica and its varieties are most beautiful and showy plants when well grown. They are perennials, perfectly hardy, and found growing in the crevices of the rocks on the Pyrenees. In our rock gardens they lighten up a wall of rocks in a most charming manner. They love plenty of light, but not direct sunshine, and they should be planted in crevices which are facing north and north-west; further, they should be put in or planted in the rock face vertically, so that the rain will not lodge in the little rosettes of leaves. Ramondias should have a good depth of soil, such as peat, good loam, cow manure, and grit. The cow manure will enable the plants to withstand drought, as it keeps the soil cool, and does not allow it to crumble in dry weather. R. pyrenaica bears violet-purple flowers with a yellow centre. R. serbica is a little lighter in colour, and is very free flowering on a north aspect. All these can be propagated from seed or increased by division. Their time of flowering is from May till July. They should not be allowed to become really dry at the roots, or it is very probably they may die. The generic title commemorates M. L. Ramond, a French botanist, who discovered the species in 1800.

W. A. Cook.

Leonardslee Gardens.

Lilium Bulbs that have recently arrived should be at once potted up in readiness for future transplanting, or where the position is ready they may be planted directly into it, placing a little sandy leaf-soil around each bulb. The ground should have been dressed with well-rotted manure and leaf-soil, and deeply dug. If potted up the liliums may be started under ashes. If bulbs of the longiflorum section are left near the surface pheasants find them. — E. F. Hazelton.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

COOL ORCHIDS.—The principal attraction in this division at the present season are the odontoglossums. I have often asked myself when entering a house full of plants in bloom at this season of the year, what can be the reason why these plants are not more generally grown in private places? If we consider them from a cut-flower point alone few flowers are more serviceable than spikes of O. crispum, and for whatever purposes they may be used the flowers are rarely out of place. One could understand the reason when imported plants of O. crispum were expensive, but during the past five or six years the supply has been undoubtedly larger than the demand, the result being that the cost has been reduced to a minimum, that is, less than is paid for many florists' flowers. The culture is also so easily managed, that where reductions in labour have been necessary and a full supply of garden products still demanded, I think it is a pity more attention is not devoted to their culture.

ODONTOGLOSSUMS. — While this may generally be considered to be the flowering season, or the season when the majority of the plants will be in spike or flower, the fact cannot be overlooked that there are plants producing flowers at practically all seasons of the year. It will naturally follow that they cannot all be treated at once; they must have individual attention, and be dealt with according to their condition of growth. Although no hard and fast lines may be laid down for the treatment of the plants in respect to potting requirements at any particular season of the year, I think we can safely observe the rule, that the period of producing new roots is the season when potting is necessary. Where a quantity of odontoglossums are grown there are a number of plants which have now just reached the stage in their growth when the pseudo-bulb is commencing to form, and this is generally the time when new roots are making their appearance. It is not always the case, for there are some of our most valuable O. crispums that do not commence rooting until the pseudo-bulbs are matured. I find the season does not matter so much as we at one time anticipated, and I would not hesitate to repot a plant at any season of the year, providing that it was in a condition to be treated.

POTTING COMPOST.—We use about equal portions of fibrous peat, chopped sphagnum, and broken beech or oak leaves. The drainage, to about half the depth of the pot, is of chopped bracken roots. We make the compost firm, but by no means hard. I consider hard potting detrimental, and when potting we avoid all lumpy portions of broken peat, for seldom are the roots found to penetrate them.

TOP-DRESSING, where the surface moss has become decayed or covered with algæ growth, may also be done at the present season. Plants that have had their roots disturbed in any way must be protected from strong light by shading, or the leaves will turn yellow; place any recently disturbed plants together, if possible, and spray them overhead two or three times a day in bright weather and keep the floors and stages damp about them, and the atmosphere of the house in a humid state at all times when the outside conditions are favourable. The night temperature at this season should be about 53 deg.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

CLERODENDRONS.—There are two useful clerodendrons which well merit a position in any collection of stove plants. Clerodendron Thomsonæ (or Balfouriana) is a deciduous creeper, a vigorous grower and of easy culture. Where cut flowers are in demand during autumn it proves most useful, being very free flowering. When grown as pot plants they are more easily managed as regards watering, and ripening of the wood. If required as large specimens they are best trained on strings under the roof, and as soon as the flower buds appear they may be removed and tied into the desired shapes. Plants are readily raised in the usual way from young growths taken off in spring, and kept close in the propagating case for a few weeks. As soon as rooted they should be potted off singly using small 60-sized pots. As the plants become root-bound shift them into larger sizes during the growing season. If smaller decorative plants are desired they can be obtained by restricting the roots of the young plants raised in spring.

CLERODENDRON FALLAX.—This is of exceptional value as a winter flowering subject, its intense scarlet flowers, with the handsome setting of green foliage, securing the appreciation of everyone, and at a season of the year when flowers are welcome. Plants are best raised annually, either from seed, which may be sown now, or from cuttings of the young growths taken off with a heel of the old wood and rooted singly in thumb pots. These should be placed in a close propagating case and occasionally sprayed with the syringe to prevent the leaves flagging. If a brisk bottom heat of 75 to 80 deg. is obtainable the cuttings will root in from four to six weeks. As soon as the plants show signs of growth, air should be admitted gradually until they can be placed near the glass. Place the plants in larger pots as they become rooted, but pots 6 in. in diameter are generally large enough for the final potting. Clerodendrons succeed well in a compost of good fibrous peat and loam in equal parts, with charcoal and coarse sand added. Shade the plants lightly from the hot sun, and particularly after potting.

GARDENIAS.—Cuttings will root very readily during the months of March and April. Plants rooted early in spring form very serviceable stock for autumn use, and will continue to produce flowers during the winter months. They are remarkably easy to cultivate, but there is one point which I think should be emphasised in their management, and this is that if it is desired to produce plants which will fully demonstrate the flowering capabilities of gardenias they must at all times be kept free from attacks of pests such as mealy bug. Gardenias require most liberal treatment and regular applications of weak liquid manure, with an occasional change, such as an approved artificial given according to directions.

GENERAL REMARKS.—Crotons and dracænas which were notched as advised in a previous calendar will require further attention. Either separate the tops from the parent plant, or place some additional rooting material up to the larger specimens and prepare for the final separation later on. After the tops have been removed and potted up care should be exercised to prevent the flagging of the foliage; if convenient they may be plunged inside the propagating frame and the larger plants may be placed for a time in the cucumber or melon house, where very little air is admitted, and kept shaded. Old dracæna stems may be cut up into lengths and placed in shallow pans or pots, these will soon push up growth, and, if grown on in a brisk temperature, will make useful plants for table or house decoration. Old crotons will be serviceable as stock plants from which good batches of cuttings may soon be obtained.—John Donoghue, Bardon Hill Gardens.

FRUITS UNDER GLASS.

PINEAPPLES.—Some of the strongest of the pines will be throwing up fruit, therefore keep up a steady bottom heat of 80 deg. to 85 deg. after their flowering stage. If necessary, give a top-dressing of good turfy loam and bone-meal: a night temperature of 70 deg., and 75 deg. by day should be maintained. Plants swelling fruit should have their pots and stages syringed with some liquid sheep manure, and be closed up early, damping all dry corners. Any ready for shifting into their fruiting pots should now be taken in hand; have the compost thoroughly warmed and made up of turfy loam, plaster rubble, a little bone-meal, and a good dash of soot; pot them in the house where they are to remain, and when potted, keep them damped overhead. If the soil was in good condition the plants will not require any water for a few days. Always use water that has stood in the house some time. Offsets put in pots last autumn should be examined and potted or top-dressed and placed back in a bottom heat of 70 deg.

PEACHES AND NECTARINES. — With the dull weather recently experienced forcing will be very slow. Fire heat must be given very carefully, as even at this stage (their first swelling) the fruits are liable to fall off, especially if the roots have gone far afield. Water only as really necessary. A few of the fruits may be taken off if they are too thickly placed, but until they are past the stoning stage it is not safe to predict a crop; 60 deg. at night is ample, and a few degrees lower is better than a few degrees higher. Syringing should be done carefully or mildew will appear; give air on favourable occasions or as the temperature of the house rises.

STRAWBERRIES. — To finish these off they should be placed in a slightly cooler house or the flavour in the fruit will be poor. Cease syringing. As there is little sun the fruits will not ripen fast. Take care to keep up a succession. The dull, sunless summer of last season and the late runners have not aided strawberry forcing, and a number of blind plants is the result. Those in 48-sized pots full of roots are giving the best results. As we were unable to obtain sufficient runners last season a few year-old plants were potted up, and although these rooted well, and the crowns are in good condition, they have failed to give a decent crop.

POT VINES.—At this stage these will require plenty of water at their roots, also some farmyard liquid in a diluted state; keep the plunging material made up as required. Thinning should be done judiciously. As fire heat will have been the only source of heat red spider is likely to appear, therefore spray the foliage with tepid soft water on a fine day.—A. B. Wadds, Paddockhurst Gardens.

THE KITCHEN GARDEN.

SEAKALE.—In most establishments this vegetable is required in quantity, so to form a succession to the forced roots the crowns remaining outside in permanent quarters should now be covered with seakale pots, placing about 15 inches of leaf-soil over the crowns. If some long litter can be put round the pots it will provide a gentle warmth, and the crop will be hastened. When sufficient pots are not available, the crowns may be earthed up with fine garden soil or leaf-soil, about the same depth. The produce is always excellent and tender from these outside beds.

RHUBARB.—Crowns may now be divided, and planted on deeply-trenched and well-manured ground. In fact, a fresh plantation should be made annually, so as to secure the best crowns for forcing. Put in small crowns, 3ft. apart each way, choosing good coloured varieties, such as Hawke's Champagne or Sutton's Early Scarlet. Where the ground has not been previously prepared through over-pressure of work, if good pits are dug out and manured as the work proceeds, this will answer fairly well. Roots that have been forced should be hardened off a little before replanting them outside.

WINTER ONIONS.—Seeds that were sown last autumn have produced strong plants, and these should now be transplanted on deeply trenched ground which has been well manured. If a dressing of wood ashes and soot can be put on the surface, it will have a beneficial effect on the crop. Plant the onions about a foot apart each way, and make each plant firm with the dibber as the work proceeds. Give them a good watering if the soil is at all dry: Ailsa Craig and Giant Lemon Rocca are two useful varieties to grow.

TURNIPS.—If a half-spent hotbed is at hand, it will prove most useful for raising a batch of early turnips, choosing a quick bulbing sort, such as White Milan. Sow the seeds thinly and thin out as required, dusting them over with fine wood ashes at intervals when they have made a few leaves.

SPRING CABBAGES. — The quarters should now be hoed, choosing a dry day for the work; it will assist the plants very much and make them heart quicker. Should some of the smaller plants be not looking well, they should be pulled out, and other stronger plants put in. I always grow two batches, and the first lot will now benefit from a sprinkling of nitrate of soda. Young plants from seeds sown at the beginning of the year will now require pricking off into other boxes or frames. These, if well attended to, will form a succession to the above.

EARLY PEAS. — Those that have been raised in pots or on turves should be well hardened off before planting them out permanently, or failure will be the result. Any rough frame will answer the purpose very well, where the lights can be removed in the day and put on at night until the weather is warmer.

POTATOES. — A few pecks may now be planted at the foot of south, east, and west walls, choosing early varieties such as Ashleaf or Sharpe's Victor. Plant them a foot apart in the trench, with a sprinkling of basic slag and decayed horse manure. In this position they form a succession to frame grown ones, and can soon be protected if the weather is cold.

CELERY TRENCHES.—These should be prepared without delay; the soil coming from them forms ridges, which can be utilised for growing dwarf peas, French beans, lettuce, and early cauliflowers. The trenches should not be made too deep, especially on cold clayey soils. For the earliest supplies the double row system answers well, but for late use I find that single rows keep much better during the winter months on heavy land. A trench 2ft. wide is ample for a double line, and 14in. for the single row, and a foot deep, placing four or five inches of good manure in the bottoms, and adding a similar depth of fine soil.

SOWING THE SEEDS.—The main crop of celery should now be sown in boxes, and placed in heat; keep the plants growing steadily, and guard against any check. A pinch of celeriac seed may be sown and treated the same way in the first stages of growth.—T. W. Birkinshaw, Hatley Park Gardens.

Wild Gardens.—These will now rapidly become more and more beautiful as early flowers continue opening. Note where and further improvements of planting may be done, but guard against any approach to formality. If there are any old tree stumps which it is not desirable to dig up, they may be covered with some of the rambling roses, periwinkle, hypericum, ivy, muhlenbeckia, or other climbing and trailing plants. Informal clumps and masses of spiræas, heaths, brooms, pernettyas, gorse, leycesteria, akebia, arundos, polygonums, hellebores, daphne, Solomon's Seal, anchusa, iris, and mimulus should be planted. In all places where they will grow plant quantities of violets, though April is soon enough to plant. The old sweet briar, with its rich fragrance, should be planted in suitable parts, as it is always welcome. Philadelphuses, weigelas, Olearia Haasti, Veronica Traversi, and others should also be remembered. The early-flowering Cornus mas, is now a very pleasing glow of yellow, where it has made good-sized bushes, and it is well suited for the more open parts of the wild garden. Now is also a good time to divide and replant Christmas roses, both in the wild garden and in beds or borders; very carefully divide them without unduly severing the roots, the outside crowns being the ones to plant; plant in well-prepared, but not newly-prepared ground; partial shade suits them best.—E. F. Hazelton, Knowsley Gardens.

WOLVERHAMPTON
GREAT ANNUAL FLORAL FETE.
July 7, 8, and 9, 1908.
Valuable Prizes. Schedules now ready.
WILLIAM E. BARNETT, Secretary.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Colonial Fruit Show.

An exhibition of Colonial fruit was held under the auspices of the Royal Horticultural Society, at the Royal Horticultural Hall, on March 5. The Cape fruits, notably the pears, peaches, nectarines, and Kelsey plums, were especially fine, but, taken as a whole, the exhibition was a poor one, and did not half fill the hall. We understand, however, that some consignments of fruit were delayed in transit.

Sir Trevor Lawrence, Bart., presided at the opening ceremony, and introduced Sir Somerset French, at the same time presenting him with the society's medal for his service in helping to bring the exhibits together.

Sir Somerset French, in the course of his remarks previous to declaring the exhibition open, said that as a fruit-growing country South Africa possesses exceptional advantages. Being situated south of the line its fruits come to maturity at a season of scarcity in the northern hemisphere, whilst the magnificent climate, and the temperature varying in different parts from tropical to temperate, put it in a position to supply the European markets with an immense variety of fruits in almost unlimited quantities—provided, of course, that the means of transport and the distribution have been fully organised. That is, of course, one of the great essentials. Like many other industries, success in fruit growing and marketing is only to be achieved by constant care and study, and it says a great deal for the perseverance and the energy of those concerned that such excellent displays as that made in the hall can be placed on the market after a journey, in many cases, of upwards of 6,000 miles.

In the earlier days of the industry experience was, he was afraid, somewhat dearly bought, but of late years, under the fostering care of the Government, the general conditions have become much more favourable. In Cape Colony expert advice is freely given to farmers, and lectures on the subject of the best and most suitable varieties to cultivate, and how to deal with the various pests which the fruit grower has to contend with are distributed broadcast. It may be said that pests flourish in South Africa; the climate seems to suit them, and they present a very serious difficulty. Government experts have been appointed to give practical demonstrations of the best methods of tackling them.

On the railways cars specially designed for fruit transport have been provided, and farmers who desire to do so can purchase boxes and packing materials at a moderate price from the nearest railway station master, and can even consign, through the Colonial Trades Commissioner in London, any fruit they may have. At the docks in Cape Town cool chambers have been arranged for, where fruit is stored at a proper temperature pending shipment, and Government inspectors have been appointed whose duty it is to inspect, grade, and mark with Government brands the consignments of any growers or shippers who desire to avail themselves of their services. The question of the most suitable temperature to be maintained during the voyage to England has also been satisfactorily solved, which is a somewhat important matter, and on the arrival of the consignments at Southampton they are personally examined by the able and indefatigable Trades Commissioner, who reports without delay to the Government should any circumstance leave room for improvement, or the quality or variety of the fruit be unsuited for the English market.

This year the supply of stone fruit has not been quite up to the average. That is largely due to the season in South Africa not having been a favourable one, a drawback to which, of course, every country is liable. Some consignments have also fallen short of the usual standards of excellence, and the prices realised have, in consequence, been below the average. This, although doubtless very disappointing to the grower, widens the area of consumers. It is rather a desirable thing sometimes to get fruit on to costermongers' barrows, because it is a very good advertisement. Speaking generally, the quality, as well as the quantity, of African fruit imported into this country is year by year increasing in a most satisfactory manner, and there is every prospect of a large trade being built up in the near future.

This year melons of various kinds will be brought over from the Cape Colony in large quantities. The season for apricots, peaches, and nectarines is drawing to a close, but that for pineapples will shortly commence, and a number of shipments of varieties of table grapes, for which the Cape Colony, if he might say so, is famous, are now on the water. All that is necessary to make the industry a success is the opening up of new markets, and the extension of those which already exist. Our Trades Commissioner is doing his best to secure this end, and he had no doubt that one of the results of this exhibition will be a more extended knowledge of the capabilities of the Colony as a source of supply at this season of the year.

It should be added that the fine views of South African scenery hung round the hall were displayed by Sir Somerset French.

Mr. S. L. Simmons, of Church Street, Croydon, and Durban, Natal, showed some exquisitely-flavoured green musk melons, quite sound and fresh; a fine lot of pears, peaches, nectarines, apples, Hannepoot grapes, all very good. Some excellent Kelsey plums, Williams' pears, Louise Bonne pears, and peaches, came from the Rhodes Fruit Farms, Groot Drakenstein, and from Mr. Barry at Rustenberg, S.A. Some magnificent Williams' pears were shown by Messrs. Gie Bros., and Mr. A. C. Buller, from the Hex River district. Mr. E. W. Pearse, Niewe Hoop, S.A., sent some splendid Kelsey plums.

One of the best exhibits was from Mr. T. J. Poupart, Central Avenue, Covent Garden Market, who had boxes of grand fruits of Williams', Louise Bonne, Duchess d'Angoulême, Beurre Bosc, Beurre Superfin, and Beurre Hardy pears, Mary's Choice and Gladstone peaches, and some fine black grapes, Hermitage variety. From the Hon. J. W. Sauer (Cape Colony), huge Cape melons, granadillas, white Hannepoot and Muscat grapes, Golden Russett and King of Tompkin's apples. Besides the South African fruit Mr. Poupart showed barrels of Baldwin and Greening apples from Ontario. Mr. Poupart was awarded a gold medal.

Messrs. Brown and Maxim, Covent Garden, set up a consignment of Cape fruit, the Kelsey plums, Williams', Duchess d'Angoulême, Beurre Bosc, Beurre Spence, and Beurre Hardy pears, Hannepoot and Hermitage grapes, and Musk melons being all excellent; silver-gilt Knightian medal.

The Army and Navy Auxiliary Co-operative Supply, Lim., Francis Street, Westminster, contributed a very fine display of Colonial fruit, worthily winning a gold medal therewith. Their melons were splendid, and their Kelsey plums grand. The Jamaica oranges, Dominican limes, Jamaica mangoes, grape fruits, splendid Williams' pears, Hermitage grapes from the Cape, apples from Nova Scotia and the Cape, yams and bananas from the West Indies, peaches and nectarines from Cape Colony, and Cleopatra and Cox's Orange Pippin apples from South Australia, were all in excellent condition, and were admirably staged, in dishes, and also as packed.

Mr. C. Du P. Chiappini, Cape Colony, was awarded a gold medal for Cape-grown grapes, melons, granadillas, pears, and Kelsey plums—very fine fruit, finely arranged on a separate table. Mr. A. Chiappini also had a good display of Cape pears, peaches, grapes, apples, and plums.

The Nova Scotia Government, through the Agent-General, showed a collection of very fine apples, and it was difficult to realise that the fruits were all picked six months previously. The varieties shown, all fresh plump, and bright, were Baldwin, Nonpareil, Ontario, Fallawater, King of Tomkin's County (very fine), Blenheim Pippin, Golden Russett, and Stark. A gold medal was awarded.

Messrs. Westmacott and Co., 139, Leadenhall Street, showed grapes and apples, but chiefly Cape wines and liqueurs. Messrs. R. Jackson and Co., 172, Piccadilly, W., had an extensive exhibit of preserved peaches, fig jam, plum preserves, apricots, Cape gooseberry preserve, etc. Preserves of many kinds were finely shown by the Rhodes Fruit Farms, Groot Drakenstein, Cape Colony. A silver-gilt Knightian medal was awarded the Cape Orchard Company, Cape Colony, for apples, peaches and plums, all well shown.

Messrs. W. Cutbush and Son, Highgate, had a bright display of forced trees and shrubs, alpine flowers, and carnations.

The Horticultural Club.

The usual monthly dinner of this club took place on Tuesday, the 3rd inst., Mr. H. J. Veitch presiding, when Mr. Charles Pearson, who had promised to give a lecture on "Birds' Eggs," was unavoidably absent owing to an attack of the prevailing epidemic of influenza, and Mr. R. H. Read, an authority on the same subject, very kindly filled the gap at short notice with a description of an ornithological excursion to Southern Spain, illustrated by numerous lantern slides.

The lecturer prefaced his exhibition of views and nests in situ by a graphic account of his trip in the spring of 1906, the object of which was the study of the birds of that country. On the way thither he passed through Bordeaux, where he saw immense forests of pines, largely devoted to the production of turpentine, every tree being scored longitudinally, and provided with little collecting cups, the raw product being worked up by terebene factories on the spot.

Passing onwards the various phases of spring vegetation were touched upon, and also, of course, the numerous species of birds, many of which were obviously migrating in enormous numbers on their way hither and elsewhere, willow warblers, blackcaps, nightingales, etc., figuring among them. Arrived in the Jerez or sherry-producing district of Spain—the word sherry being really an approximation to the Spanish name, while the old word sack was a corruption of seco, or dry sherry sack, meaning dry sherry—the lecturer made his way to the curiously-constituted bird paradise known as the Marismas, a vast area of flat land covered during the winter and spring by about two feet of water, which dries up in the summer, leaving large expanses of sun-dried mud, varied by stretches of sand and shingle. Birds of innumerable kinds abounded here—herons, stilts, terns, and other waterfowl, and egrets, kites, and other birds of prey.

A curious arboreal feature in this district was that, owing to the scarcity of fuel, the pine trees were all denuded of their lower branches and were consequently reduced to somewhat mop-like forms. In some places drifting sand invaded both trees and smaller vegetation, and some of the slides showed curious effects in this direction. Among the most interesting slides were those showing various nests. Herons and eagles, etc., high up in lofty trees, while another series depicted ground nests, in many cases hardly worthy of the name, the eggs being laid in all but invisible groups among rough stones and shingle, and, by their mottled coloration, almost defying the eye to detect them. The nests and eggs of many aquatic birds were also shown, cosily planted amid the reeds and rushes, which in many cases necessitated standing knee-deep in water in order to obtain the photograph.

A discussion followed, in which Messrs. W. Pycroft, Percy F. Bunyard, W. Marshall, H. J. Veitch, and C. T. Druery took part, and a hearty vote of thanks concluded the entertainment.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, March 3.

Present: Sir John T. Dillwyn-Llewelyn, Bart. (in the chair); Prof. G. S. Boulger, Rev. W. Wilks, Messrs. A. W. Sutton, A. R. Rolfe, J. Douglas, J. T. Bennett-Poë, C. T. Druery, L. de B. Crawshay, G. Massee, G. S. Saunders, W. Cuthbertson, G. Gordon, W. Hales, A. Worsley, E. M. Holmes, S. U. Pickering, F. J. Chittenden (secretary), and numerous visitors.

INHERITANCE OF ALBINISM IN ORCHIDS.—The following communication was received from Mr. C. C. Hurst, F.L.S.: Two distinct and definite cases of albino orchids producing coloured forms when crossed were recently brought before this committee by Mr. H. J. Chapman. Such facts, expected by the Mendelians, are important, inasmuch as they go to show that albinism in orchids is inherited in a similar manner to albinism in sweet peas and ten-week stocks, and in accordance with Mendel's law. An albino orchid is distinguished from a coloured one by the absence of purple sap. For instance, the well-known Paphiopedilum (cypripedium) insigne Sanderæ is an albino form from which the purple ray of the type has disappeared. Recent experiments with sweet peas and stocks, carried out by Mr. W. Bateson, F.R.S., Mr. R. C. Punnett, and Miss E. R. Saunders at Cambridge, have fully demonstrated that the appearance of sap colour depends on the simultaneous presence of two colour factors. If both of the colour factors are present the sap is coloured, but if either (or both) of the colour factors is absent, the sap is colourless. With regard to the cases of Paphiopedilum (cypripedium) brought forward by Mr. Chapman, for the sake of simplicity we will call the two colour factors C and P. The typical coloured forms of P. insigne, P. bellatulum, P. callosum, and P. Lawrenceanum will therefore be carrying both of the colour factors C and P. Their albinos will, on the other hand, be carrying either the C factor alone, or the P factor alone (or neither). The known facts of the breeding of albinos of these four species seem to be in accordance with the conception that P. insigne Sanderæ and P. bellatulum album are carrying the factor C alone; while P. callosum Sanderæ and P. Lawrenceanum Hyeanum are carrying the factor P alone (or vice versa), as the following table, comprising all the results known to me, shows: Table A: 1, P. insigne Sanderæ (C) x P. insigne Sanderæ (C) gives albinos (C C); 2, P. callosum Sanderæ (P) x P. callosum Sanderæ (P) gives albinos (P P); 3, P. Lawrenceanum Hyeanum (P) x P. Lawrenceanum Hyeanum (P) gives albinos (P P); 4, P. Lawrenceanum Hyeanum (P) x P. callosum Sanderæ (P) gives albinos (P P); 5, P. callosum Sanderæ (P) x P. insigne Sanderæ (C) gives coloured hybrids (C P); 6, P. callosum Sanderæ (P) x P. bellatulum album (C) gives coloured hybrids (C P); 7, P. bellatulum album (C) x P. Lawrenceanum Hyeanum (P) gives coloured hybrids (C P). The next table gives the remaining possible matings between the albinos concerned, together with the expected results:— Table B: 1, P. bellatulum album (C) x P. bellatulum album (C) should give albinos (C C); 2, P. bellatulum album (C) x P. insigne Sanderæ (C) should give albinos (C C): 3, P. insigne Sanderæ (C) x P. Lawrenceanum Hyeanum (P) should give coloured hybrids (C P). Future results will show how far the above conception, based on Mendel's law, is correct. If Mr. Chapman thinks well to self-cross the coloured hybrids that he obtained from two albinos, he may expect to get, on the average, nine coloured forms to seven albinos.

BIGENERIC HYBRID ORCHID.—Mr. R. A. Rolfe, A.L.S., drew attention to the bi-generic orchid Epi-diacrum Colmani shown by Sir Jeremiah Colman, Bart., and raised between Diacrum bicornutum ♀ and Epidendrum ciliare ♂, and remarked that this new and interesting hybrid approached closely in habit, inflorescence, and form of flower to the pollen parent. He also commented upon the question of the nomenclature of bi- and poly-generic hybrids, saying that he considered it best to compound the name of the hybrid from the names of the parent species, and to avoid conventional names, unless they were so formed, as long as it is possible to do so.

GREEN-FLOWERED PRIMULA SINENSIS.—Mr. A. W. Sutton showed a plant of Chinese primula with green flowers, arising apparently from chlorosis of the corolla. The seed had been sown in 1904 and onwards, and had each year bred true until this plant had appeared among the seedlings raised last year. Only once before had Mr. Sutton seen a similar thing, and that was in 1902 when the same kind of sport occurred in another stock of double white P. sinensis, but in that case the flowers were not so well developed. The pollen of this plant appears perfect, and possibly seeds may be obtained from it.

COLOUR SPORTS IN BORONIA AND ERICA.—Mr. H. J. Veitch showed a plant of the albino form of Boronia megastigma, a portion of one branch of which bore flowers of the normal colour, purplish brown, thus reverting to the type from which the sport arose. From Mr. W. Earp, of Bayham Abbey Gardens, came a spike of an Erica (sp?) which last year had borne white flowers only, but every flower this year was of a pinkish colour. Some members of the committee thought that possibly the flowers in the previous year had been caused to open in the dark.

CROCUS WITH PARTS IN FIVES.—From Mr. H. J. Elwes, F.R.S., came a crocus flower having ten perianth segments in two whorls, five stamens alternate with the outer perianth pieces, and a five branched style.

"CANKER" CAUSED BY MONILIA.—Mr. Dunlop, of Armaghmore, sent a branch of apple Lord Derby with cracked bark, giving it the appearance of incipient canker. Inspection revealed the greyish sclerotia of Monilia fructigena in the cracks, and Mr. Massee said that this fungus, which is perennial in the tissues, forms sclerotia beneath the bark, causing the latter to be raised and to crack. Spores are formed on these sclerotia, and the disease spreads thence to the young leaves, shoots, flowers, and fruits.

TUBEROUS SOLANUMS.—Mr. A. W. Sutton read a paper on "Wild Types and Species of Tuber-bearing Solanums," illustrated by lantern slides. In the course of his interesting remarks, Mr. Sutton referred to the impetus given to the search for the wild type from which the potato has been derived by Lord Cathcart, and to Mr. J. G. Baker's work with the group, and related his experiences during the past twenty-five years in cultivating and hybridising the tuber-bearing species of Solanum, S. tuberosum, S. polyadenium, S. verrucosum, S. Maglia, S. etuberosum, S. Commersoni, S. Ohrondi, and S. tuberosum var. boreale (equals S. Fendleri). Whenever any of these have produced fertile seed the type has been reproduced, except in the case of S. etuberosum. The last named has apparently never produced fruit in this country until 1906, when a single berry was found. From the seeds it contained a number of plants approaching in appearance the cultivated forms of the potato have been obtained, and Mr. Sutton suggests that possibly it is from S. etuberosum that the cultivated potato has been wholly or in part derived. If so it is a hopeful sign for the future races of the potato that no plant of S. etuberosum has yet been known to be attacked by the fungus Phytophthora intestans. The meeting closed with a hearty vote of thanks to Mr. Sutton, who not only illustrated his lecture with slides, but with numerous specimens of tubers of the wild types and seedlings from S. etuberosum, etc.

United Horticultural Benefit and Provident Society.

The annual general meeting of this splendid friendly society was held at the Royal Horticultural Hall on Monday, March 9. Mr. Chas. H. Curtis presided over a moderate attendance—indeed, it might be said, that, as the management of the society is so excellent, members ought to attend better out of courtesy to the members of committee, who give their services so readily.

After the preliminary matters had been disposed of, the presentation of the report and balance-sheet was made.

REPORT OF THE COMMITTEE FOR 1907.

The committee has again great pleasure in presenting its annual report. During the year 1907 the society has made steady progress. Sixty-two new members joined, but thirty-six have fallen out of the ranks (several having gone abroad) and eight have died, thus leaving a net increase of eighteen, the smallest increase for several years. The membership now stands at 1,246.

The loss of an old and valued friend and trustee, the late Mr. George Wheeler, has to be recorded. Mr. G. Wheeler and his brother Mr. Joseph Wheeler, were trustees for thirty-one years. With the death of Mr. G. Wheeler and the issue of new rules, it became necessary to elect new trustees. Accordingly, at the annual general meeting on March 11, 1907, Mr. James Hudson, V.M.H., Mr. Riley Scott, and Mr. Charles H. Curtis were elected trustees, and Mr. William P. Thomson was elected treasurer, in the place of Mr. James Hudson, who retired from that office.

Sick pay was very heavy during the year, but it must be remembered that members who have been ill more than twelve months are now paid from the sick fund instead of from the benevolent fund; there are now five chronic sick members on the fund. The amount of sick pay for the year was £4[illegible] 7s. 6d. This amount is apportioned to members at 9s. 3d. and 6s. 2d., according to scale. Large amounts have been paid out at members' deaths to their nominees, the largest being over £133. Over £70 was also paid out to one lapsed member. Several members over sixty years of age have taken advantage of the new rules, and drawn the interest on their balance in the ledger. These payments will doubtless increase in the future, several other members having now nearly reached that age. There are now 54 members over sixty years of age; forty-eight over fifty-five and under sixty years of age; and seventy-three over fifty and under fifty-five years of age.

The benevolent fund has been greatly relieved by the transfer of chronic sick cases to the sick or benefit fund. Every member also now pays 3s. annually, which increases the receipts considerably. The amount paid from this fund to members over seventy years of age, and in special grants, was £10[illegible] against £132 5s. during 1906.

The convalescent fund has not been much used during the past year, only £4 having been paid to three members. The receipts from members have been small. Messrs. Hurst and Son kindly gave their usual £5 [illegible] to this fund.

The expenses of management are a little less this year, being £215 2s. 4d., against £248 0s. 2d. in 1906, the higher sum in the latter year being due to the expenses of new rules.

The annual dinner in November was presided over by Sir Albert Rollit, LL.D., D.C.L., who made an excellent chairman, and also become a honorary member. The dinner was not a financial success, the balance being on the wrong side by about £3. The continuing of this dinner as an annual function has been exercising the mind of the committee, and it is possible that some modification of this event may be necessary.

The great feature of the annual dinner was the presentation to Mr. James Hudson, V.M.H., of a very handsome solid silver tea and coffee service, with a large framed portrait of himself, as a token of esteem and in recognition of valuable services rendered to the society as treasurer during the twenty-five years. The members were invited to contribute to this presentation, and they responded nobly. After all expenses had been paid, it was found that there was sufficient money in hand to enable the committee to add a pair of solid silver candlesticks to the tea and coffee service. Needless to say, Mr. Hudson was greatly delighted with this substantial evidence of the high regard in which he is held by the members.

The committee is grateful to the honorary members for their continued support, and ventures to hope that other gentlemen will also become subscribers. The committee also would again urge the members to help to increase the membership, by pointing out to young gardeners the great advantages that the society offers, as it is a benefit society, insurance fund, and savings bank combined, and is worked on safe and economical lines.

Signed on behalf of the Committee,

CHARLES H. CURTIS (Chairman).
WM. COLLINS (Secretary).

From the financial statement, which involves several balance-sheets, we gather that subscriptions to the benefit fund amounted to £2,003 8s. 1d., and £479 9s. 6d. was paid out as sick fund. The benevolent fund expenditure amounted to £107 9s., and the income from members' subscriptions alone were £170 16s. In the case of the convalescent fund, only £4 was paid out, whereas the income from interest, subscriptions, and donations, amounted to £27 5s. 11d. The balance to the good on the benefit fund is £24,094 4s. 1d.; on the benevolent fund, £5,007 4s. 6d.; and on the convalescent fund, £590 17s. 7d. We append the management fund account and the statement of liabilities and assets, the latter showing the investments of the society.

The motion for the adoption of the report and balance-sheet was moved by the Chairman, who referred to the chief features of the year's working, and emphasised the need for greater enthusiasm on the part of the members to secure new members among their gardening friends. He also pointed out the extremely sound financial condition of the society, the high opinion in which it was held by the Registrar General, and said that the senior auditor, Mr. Gunner, had given it as his opinion that there was not another friendly society that gave such a good return for the subscription paid. The motion was duly seconded, and carried without comment, everyone appearing to be well satisfied with the work done.

The four retiring members of the committee, Messrs. E. Burge, J. Bedford, W. Stanbridge, and C. Harding, were unanimously re-elected. Mr. Jas. Hudson moved the re-election of Mr. W. Collins as secretary; this was seconded by Mr. Joseph Wheeler, one of the first members of the society, and carried unanimously. Messrs. Gunner and Puzey were reappointed auditors on the motion of Mr. J. Harrison Dick and Mr. E. Burge, the former showing that these gentlemen not only did their work well, but took a kindly interest in the society's work, and had from time to time made useful suggestions to the committee. Mr. Thos. Winter proposed, and Mr. Hawes seconded, a vote of thanks to the three trustees, Messrs. Jas. Hudson, Riley Scott, and C. H. Curtis, for their services during the year, and it was pointed out that, though the amount of stock purchased during the year was £50 less than in 1906, the returns therefrom were about £10 more than the income from the 1906 investments. The trustees suitably responded. On the motion of the Chairman, Mr. W. P. Thomson received the thanks of the members for his services as treasurer during the year. Mr. Thomson has proved an admirable successor to Mr. Hudson.

A vote of thanks to the Horticultural Press for kindnesses received was moved by Mr. J. Bedford, and carried with great heartiness. The Chairman read the names of the original trustees, and committee of the society, from the original balance-sheet kindly presented to the committee by Mr. Wm. Marshall, V.M.H., one of the founders of the society, and who was present at the meeting. The original balance-sheet is interesting inasmuch as there is a sum of nearly £500 on the income side, and not a single item of expenditure opposite it.

The proceedings terminated with a vote of thanks to the chairman, moved in a very kindly and appreciative manner by Mr. Wm. Marshall, seconded by Mr. W. Woods.

At the subsequent committee meeting Mr. Chas. H. Curtis and Mr. Thos. Winter were again re-elected chairman and vice-chairman of committee respectively. These members have now held office for eight or nine consecutive years.

British Gardeners' Association.

Great enthusiasm was displayed at the public meeting recently held in Richmond, Surrey, but, unfortunately, the inclemency of the weather prevented a large attendance. Mr. E. F. Hawes, in addition to presiding, gave a very interesting and rousing address on the "B. G. A.," and especially emphasised the need for co-operation amongst professional gardeners. He was also ably supported by Mr. Dallimore, who dwelt on the necessity for drawing a line of distinction between the gardener and garden labourer, and by Mr. J. Weathers, who gave much useful information relating to the B.G.A., and said that the Executive Council was always ready to support any of its members in litigation, provided they could state a good case.

On the evening of Saturday, March 7, a meeting was held at "Carr's," Strand, for the purpose of bringing the objects of the association before the gardeners employed in the London parks and gardeners in private gardens within the metropolitan area. Mr. George Gordon, V.M.H., presided over a large attendance, and addresses were given by Mr. J. Weathers, Mr. E. F. Hawes, and Mr. Lewis. Following the addresses there was a brisk discussion, and at the close it was unanimously resolved to form a metropolitan branch of the association.

Bristol Gardeners' Association.

A most enthusiastic meeting was held on Thursday, February 27, at St. John's Rooms, presided over by Dr. Shingleton Smith. A large gathering of members attended to hear a lecture upon "Orchids," given by Mr. Hunking, gardener to Alderman Dix, Hampton Lodge. In his introductory remarks the lecturer said that as the orchid family was so comprehensive, there being so many species, it would be impossible for him to deal with them all. In no department of horticulture had such rapid strides been made as with orchids—methods had changed with the times. Formerly the supposition prevailed that orchids were very difficult to cultivate, chiefly owing to the belief that they required a very high temperature, but now that cultivators better understood their requirements, it was found they were no more difficult than other plants. The successful production of flowers depended upon the rest given after growth was completed. Liquid manure proved beneficial if used for damping when the plants are in full growth. A paved floor is to be avoided. The lecturer said the floors at Hampton Lodge are of coke, about two feet thick, well saturated with liquid manure. Remarks upon ventilation, shading, build of flower, insect pests, and diseases were included in this very interesting lecture. Dr. Shingleton Smith opened the discussion, which was well maintained by Messrs. Binfield, Curtis, Kitley, E. T. Parker, Scott, Jennings, Shaddick, Lee, and Woodward. Hearty votes of thanks were given both to the lecturer and chairman at the close. Certificates were awarded to Mr. E. T. Parker for Cypripedium Harrisianum, and to Mr. Hunking for Dendrobium Artemus. Only one exhibit of freesias was staged. First prize was awarded to Mr. Weare, gardener to Mrs. Hall, Redland.

Basingstoke Gardeners' Association.

The members of this association held a most successful social evening at the Basingstoke Town Hall last week. About fifty members sat down to tea, and they, as well as the friends who came later, were delighted with the beautiful floral decorations. The latter were chiefly due to the skill and kindness of Messrs. J. Mares, W. Stark, A. Wadmore, and G. Neal. Carnations, violets, cyclamens, snowdrops, daffodils, hyacinths, tulips, and orchids were the flowers most extensively used.

Mr. J. Mares, of Manor House, president of the society, presided, and was supported by Mr. T. A. Phillips, Mr. W. Cannon (Mayor of Basingstoke), Mr. W. Stark, Mr. C. Noakes, Mr. H. Noakes, and Mr. J. C. Newsham. The latter, who is head master at the County Council Farm School at Basing, is the genial and energetic hon. secretary of this new society. There were a few brief and congratulatory speeches after tea, a lot of excellent music, and a little straight talk as to the advantages and the responsibilities of membership.

Cardiff Gardeners' Association.

The fortnightly meeting was held at the Philharmonic Restaurant, on Tuesday, the 3rd inst., Mr. H. R. Farmer presiding over a very good attendance. The lecturer was Mr. J. Basham, jun., representative of the Bassaleg Gardeners' Association, who lectured upon "Mutual Improvement Societies, their Benefits, and how they may be made more Useful."

In his remarks the lecturer pointed out the value of gardeners' societies, and the work that they were endeavouring to do for the benefit of the horticultural world, and suggesting that all employers should encourage their gardeners in some small way, as a recognition of their efforts, and that all gardeners should become Fellows of the R.H.S., as the literature they would obtain would be of service. A series of new lectures ought to be taken up by societies, and these of a more scientific character, so that greater interest might be taken in botany, cross-fertilisation, bacteriology, manures, etc.

A good discussion followed, many members taking part in the debate, which was opened by Mr. J. Julian.

A vote of thanks was accorded Mr. Basham. A very fine display of daffodils and hyacinths was made, for which Messrs. Malpass and Freeman took equal honours.

Sandhurst Gardeners' Association.

The fortnightly meeting was held in the Church Schools, Sandhurst, on Tuesday, March 3. There was a goodly number of members present to hear Mr. M. Goddard, of The Gardens, Ambarrow, Sandhurst, who read a paper on "A Few Greenhouse Plants." The plants specially mentioned were Primula sinensis, Primula obconica, schizanthuses, and Trachelium cæruleum. Details were given as to seed sowing, soils, and the general treatment of the plants. A good discussion was created, in which the following took part: Messrs. Evans, Townsend, Chapman, Leversuch, Prior, Gear, A. Collins, Shepherd, Dupond, and Austin. On the proposition of the Chairman, a hearty vote of thanks was accorded Mr. Goddard for his paper. Mr. Townsend, Sandhurst Lodge Gardens, staged plants of Eupatorium ianthemum, and Mr. Dupond, Crowthorne Nurseries, showed dwarf plants of laurustinus.

Woolton Gardeners' Society. —A meeting of this society was held at the Mechanics' Institute, on the 5th inst., Mr. L. Godseff, superintendent of Calderstones Park, occupying the chair. The essayist, Mr. A. Calderbank, of Altrincham, selected for his subject "The Herbaceous Border." He recommended trenching three feet deep, with a liberal addition of rotten cow manure when the soil is light or of a sandy nature. Early autumn planting was desirable, but if not convenient it was better to defer planting until the spring. A list of the most desirable kinds was submitted in the order of flowering, with hints as to special culture. A list of suitable flowering shrubs to form a background, and a few annuals that were worthy of association with the perennials, were also noted. A discussion followed, in which Messrs. J. Stoney, W. W. Gamble, R. Todd, R. G. Waterman, W. D. Skinner, and the chairman took part. A cordial vote of thanks to the lecturer and chairman terminated the proceedings.

Beckenham Horticultural Society.

On Friday, March 6, Mr. G. A. Watson, B.Sc., of Beckenham, delighted a good audience with a lecture on "The Common Horsetail (Equisetum)." He used original diagrams to illustrate his remarks. Mr. Watson was very warmly thanked for his discourse, also for so kindly filling the vacancy at the last moment, Mr. Morrill, of Sutton, who was scheduled for the evening, being ill, and quite unable to fulfil the engagement.

Liverpool Horticultural Association.

The members of this society met at the Common Hall, Hackins Hey, on the 7th inst., Mr. T. Foster occupying the chair. The subject for consideration was in the able hands of Mr. Ben Ashton, of Lathom Gardens, who delivered an excellent paper on "The Cultivation of Tree and Malmaison Carnations." The essayist gave the details of his own system of cultivation, in which he recommended span-roofed houses from nine to sixteen feet in width, according to requirements, with side stages for the former and centre and side stages for the wider structure. Cuttings were advised for the tree varieties, and layers for the Malmaisons. A loam of medium texture, which had been stacked six months, with a little leaf mould and red sand, and a moderate addition of bonemeal was the compost recommended. Occasional waterings with weak guano water and top-dressings of bonemeal were advised. A moderate supply of water was needed, with a sprinkling overhead twice a day in fine weather, and with an extra midday syringing in hot, dry weather.

Insect pests and ventilation received close attention. After the paper, a discussion followed, with further questions, which were suitably answered. A cordial vote of thanks on the motion of Mr. R. G. Waterman, seconded by Mr. E. F. Hazelton, and supported by Mr. J. Stoney, was given to the lecturer for his essay. The thanks of the meeting was also given to Mr. T. Foster for presiding.

Croydon Gardeners' Society.

On Tuesday Mr. A. E. Thatcher, from Aldenham House Gardens, Elstree, lectured on "Hardy Flowering Trees and Shrubs." There was a capital attendance of members, many of whom had seen the fine collection when visiting these gardens last summer, and knowing that Mr. Thatcher has the care of the Aldenham House collection the information expected from him as an expert could be accepted and put to practical use. He made a strong appeal to the younger members of his audience to miss no chance of gaining knowledge on this subject. There is much to consider before commencing to make new pleasure grounds, or improve the garden which perhaps may exist, and the principal points to bear in mind are the position these flowering shrubs should occupy, the preparation of the soil for their reception, and the blending of colours to harmonise with each other, and also varieties which will be in flower practically all the year round. He advised deep trenching, and attention to the drainage, for almost without exception shrubs of this class will not thrive in waterlogged and sour soil. The roots should be well spread out to encourage the small fibrous rootlets, and it is a mistake to plant too deeply. Early spring or autumn are favourable for planting. The pruning is of considerable importance, and one must study each individual plant for this operation, as some require cutting hard back, whilst others require tenderer treatment to produce best results. There can be no hard and fast rule laid down for this. He strongly advised labelling each variety, for with this adoption the interest to visitors in inspecting these plants is greatly enlivened.

Lantern views of many of the subjects under his charge were thrown on the screen, and in each instance he described the treatment given to it. To give continuous bloom from spring to winter he enumerated some of the best kinds to plant, and lengthy as the list was it was most useful in completing what was generally considered one of the best lectures given before the society.

Mr. M. E. Mills proposed a very hearty vote of thanks to Mr. Thatcher, and this found ready support from the audience.

Some good exhibits came from the members, including a basket of lachenalias from Mr. Oxtoby, a Nephrolepis todeaoides from Mr. P. Chaff, a very fine specimen platycerium from Mr. Mills, and three pots each of primulas and cinerarias from Mr. A. Edwards, all of which received a vote of thanks.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

WATER GLASS.—P. T., Aylesbury: "Water glass" is liquid silicate of potash. It is used to preserve eggs.

SWEET PEA BICENTENARY.—J. G., York: The celebration of the bicentenary of the introduction of the sweet pea into Great Britain was held at the Crystal Palace on July 20 and 21, 1900.

DISEASED IVY-LEAVED PELARGONIUMS.—J. G., King's Lynn: We believe the damage is due to some error in cultivation rather than a fungus attack, but we are having the matter investigated.

SWEET PEA ROSIE ADAMS.—N. S. M., Monkseaton: This new sweet pea cannot be obtained now. It was raised by Mr. Thomas Stevenson, and distributed by Mr. H. J. Wright, but the demand far outran the supply many weeks ago.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—G. S. B., Durham: You had better apply for full particulars to the secretary, Mr. G. J. Ingram, Victoria Street, Westminster, S.W., who will at once supply you with the needed information.

BLOTCHED CAMELLIA LEAVES.—F. L., Newark: The silvery blotches on the camellia leaves are caused by a fungus named Pestalozzia Guelpini, a pest that does much damage in the Indian tea plantations. The only safe method of dealing with the pest is to remove and burn all infected leaves.

GARDENERS' COMPANY.—G. J. O., Harrow: The Worshipful Company of Gardeners was formed in 1605, a few months previous to the Fruiterers' Company. The clerk is Mr. E. A. Ebblewhite, F.S.A., and his address is 1, Paper Buildings, Temple, London. He will let you have full particulars, fees, etc.

EXHIBITING SWEET PEAS.—R. A., Epsom: We recommend you to obtain "Sweet Peas and their Cultivation" (1s. 2d or 1s. 8d., post free, The Gardeners' Magazine Office, 148, 149, Aldersgate Street, E.C.). This work, by the hon. secretary of the National Sweet Pea Society, gives full instruction for the culture and exhibition of sweet peas, for packing, for vases, and stands, etc., etc., as well as ample information on general culture, history, varieties, etc.

FEEDING ROSES.—E. T., Walsall: Under the circumstances you should give the ground a dressing of bone-meal at the rate of two ounces per square yard; give this at once, and hoe in. When the flower buds begin to swell up, in June, you may give a light dressing of the proprietary manure named, using this at half the strength of the bone-meal, either applying it during a shower or watering it in.

GARDEN WORK.—B. B., Newtown (Mont.): You will find "The Year's Work in the Garden," given in the "Gardening Year Book for 1908," exactly the matter you require. Under each month, the current work in the flower garden, conservatory and greenhouse, fruit garden, fruit house, orchid house, and kitchen garden, is set out and explained, and there is also a list of daily reminders. The book is 1s. 2d. post free from the Gardeners' Magazine Office, 148 and 149, Aldersgate Street, E.C.

GRAFTING CONIFERS.—Early spring and about the middle of August are the best periods at which to graft conifers. The stocks should be about two or three years old, in small pots, and placed in a cool, close frame. Side grafting is the method found most suitable. The chief stocks used are as follows: For cupressus, Cupressus Lawsonianus; for abies, Abies pectinata; for yews, Taxus baccata; for thuias, either the Eastern or Western thuias (T. orientalis and T. occidentalis); for junipers, Juniperus communis; for the spruce group, Picea excelsa; and for the Hemlock Fir group, Tsuga canadensis. Grafting should always be done as low down on the stock as possible.

OSTERLEY PIPPIN APPLE.—R. C. O., Leicester: This apple was regarded by the late Dr. Hogg as "rich, juicy, and sweet, with a brisk and aromatic flavour, somewhat resembling, and little inferior to, the Ribston Pippin. A handsome and very excellent dessert apple; it is in use from October to February, and is not subject to be attacked with the grub as the Ribston Pippin is." We are told that the variety was raised in Earl Jersey's garden at Osterley Park, Isleworth, Middlesex, from a seed of Ribston Pippin. It should be remembered that a quite large number of apples have been raised in the Thames Valley district. For instance, Packhorse and Robinson's Pippin were raised in the garden of the Packhorse Inn at Turnham Green; Bigg's Nonesuch, at Twickenham; Braddick's Nonpareil, at Thames Ditton; Ord's Apple, at Fulham; Padley's Pippin, at Hampton Court; and several varieties at Frogmore.

AUTOGAMY.—S. J. W., Cirencester. Autogamy is another term for self-fertilisation or self-pollination. It is only in hermaphrodite flowers that autogamy is possible, but it by no means follows that self-pollination is the only means of fertilisation or reproduction open to such flowers. Indeed, taken as a whole, flowers appear to aim at cross-fertilisation, and, this end secured, there is no need for autogamy; but, failing cross-fertilisation, many flowers resort to autogamy, and a study of the means taken to bring this about is no less interesting than the study of methods whereby cross-fertilisation is aimed at. We strongly recommend you to read Kerner's "Natural History of Plants" (Blackie and Son, Old Bailey, E.C.). In the second volume, pp. 331-401, autogamy is discussed in a most able and interesting manner, and it is shown that self-fertilisation may be brought about by lengthening of stamens, bending of stamens, movements of stamens, shortening of pistil, elongation of pistil, bending of the pistil, coiling of stamens and pistil, contraction of style branches, bending back of style branches, the action of the corolla—chiefly by closing, movements of the flower stalk, and by a co-operation of movements.

SWEET PEA STREAK.—N. E. S., Cambridge: We have only once seen what is known as "streak" disease in sweet peas, and that was in the case of a diseased plant brought to the first exhibition of the National Sweet Pea Society held in the Royal Horticultural Hall. It was brought over from Ireland by Mr. H. J. R. Digges, an enthusiast whose ardour has been somewhat damped because he finds it almost impossible to grow sweet peas in his garden. Last season we inspected miles of sweet peas, and in almost all of the English counties, and not once did we see this new disease. We look in vain for any mention of it in "Sweet Peas and their Cultivation," and in the "Sweet Pea Annual," where there are about fifty answers from sweet pea experts, to sets of questions submitted by the N.S.P.S. Committee. The eighth question was: "Has fungus disease attacked your plants? If so, please state its character, effect, time of appearance, remedies employed, and the final results." The direct negative was given by thirty experts, several did not answer the question at all, a few said they had suffered from sweet pea mildew, and two experienced unhealthy conditions that may or may not have been disease. We do not contend, from this evidence, that there is no such thing as sweet pea streak, but we believe the disease, however caused, is of limited distribution. It would be ten thousand pities if a disease were to become epidemic and kill the sweet pea industry, as the hollyhock industry was killed many years ago, therefore the new pest will be investigated, and we understand that the N.S.P.S. and various scientific authorities are preparing to deal with the matter this season.

GARDENING FOR PROFIT.—F. M., Surrey: A capable and energetic man, with a modest capital, could make a comfortable living out of an acre and a-half of good land, with a glasshouse or two, but to pay a man a good wage, incur the responsibility, provide the capital, and expect a handsome return on the money and time expended, would be to expect too much. Under the conditions you suggest the undertaking would not be a very profitable one. To succeed with rhubarb and seakale the land must be good and well cultivated, better, in fact, than we believe yours to be, judging from the district. You should figure out the value of the land, and allow so much for rent; then the cost of houses and depreciation; the amount of rhubarb and seakale you could grow, and a reasonable sale for same; the number of tomatoes you could grow, and the return for a reasonable crop; the number of chrysanthemums you could accommodate, and what they are likely to bring in, etc., etc. The cost of firing, of stock to commence with, of soils, manures, seeds, stakes, etc., could all be fairly well estimated, and allowance would have to be made for the conveyance of the produce to the customers or market. Set down your prospective income at the lowest market rates for the several seasons, and your expenses at the highest local rates, and then see on which side the balance stands. It will be an interesting study, but, as already stated, you will not feel inclined to take up the business as an especially profitable venture when you have made the study. And, after all, so much depends upon the man in charge, remembering that a first-rate man who might run a concern successfully is just the sort of man to start out for himself rather than for the profit of someone else. Even given the right man, you need either more land for a wider range of hardy subjects, or more glass; and the latter means an increase of capital outlay and current expenditure, with greater risks to set against the larger prospective profits.

NAMES OF PLANTS.

T. H., Atherton.—Magnolia Soulangeana.

A. J., Steventon.—1, Cyclamen Coum; 2. Cornus Mas; 3, Pinus cembra.

N. W., Grimsby.—1, Cypripedium Haynaldianum; 2, Peristrophe speciosa; 3, Begonia nitida.

E. P. S., Horsham.—1, Impatiens Sultani; 2, Pellæa cordifolia; 3, Monochaetum Hartwegianum.

S. S., Ipswich.—1, Sciadopitys verticillata; 2, Cupressus Lawsonianus; 3, Abies cephalonica; 4, Thuia orientalis.

L. C. G.; Tadcaster.—1, Hoya carnosa; 2, Acacia longifolia; 3, Erica persoluta; 4, Begonia fuchsioïdes; 5, Cypripedium villosum.

OBITUARY.

MR. E. J. CASTLE.

It is with very great regret we learn of the death of Mr. E. J. Castle, who for several years has been one of our most regular and most valued contributors to these columns. Barely forty years of age, Mr. E. J. Castle passed away suddenly on Wednesday night, March 4. Mr. Castle was a keen gardener, and his loss to the horticultural world is by no means small. He gained his horticultural experience in Colonel Kidd's garden at Dartford; at Hillingdon House, Uxbridge; at Messrs. H. Cannell and Sons', Swanley, etc., etc., and his memory for the details of his business was especially good, as his writings proved. For several years Mr. Castle was sub-editor of "The Gardener," but failing health led him to resign his position. For some time he resided in the Channel Islands, but eventually returned to Kent, where, at Lyminge, near Hythe, he lived for some time previous to his death. His friends had hoped that, though robust health was not possible, there were many years of usefulness yet before him. His ability, sterling character, pleasant disposition, and fund of humour endeared him to all who knew him, and there are many who will mourn their loss, and join in sympathy with his widow. Mr. Castle was a great lover of sweet peas and of tulips, and these he cultivated extensively. His nom-de-plume in the GARDENERS' MAGAZINE has always been "E. J. Kingshome," or "E. J. K.," and we were reading proofs of an article by him on his favourite flower when we received the news of his untimely death.

THE CURRANT AND HAZEL BUD MITES.

The Eriophyidæ are a family of mites, the members of which are feeders on plants. Some of them live on the surface of the attacked tissue, some live in buds, which may swell as a result of their presence, some cause a curling of the leaf, and some give rise to projecting galls or malformations on leaves and more rarely on twigs.

The black currant bud mite (Eriophyes ribis) and the hazel bud mite (Eriophyes avellanæ) live in each case in the buds of the respective plants, and as a result of their presence infested buds swell greatly.

Every now and again there is a recurrence of the statement of the belief that the hazel bud mite (E. avellanæ) can pass to, live in and cause to swell, the buds of the black currant, and that thus black currant bushes may become infected from neighbouring hazel or nut trees. This is an echo of an old controversy dating from early in last century, when workers on these mites joined issue with one another as to whether the same mite could make more than one kind of gall; or give rise to a gall on one plant and no gall on a different kind of plant; or whether the same species of mite could be found in the same kind of gall on plants with little relationship to one another. Thus the same mite was recorded as found in one kind of gall on the leaves of the lime trees and on the willow and in the swollen buds of the hazel.

The difficulties and disputes have been due partly to faulty observation; to insufficient magnification of the mites before the perfecting of the compound microscope; to the extreme minuteness of the mites—for only a few of them reach one-hundredth part of an inch in length, and to the difficulty of the characters, which are made the basis of distinction and separation of species—such characters as the number of bristles, the position of the bristles, the sculpturing and striations of the dorsal shield, and the shape of the ventral plate.

The great worker in recent years on the genus Eriophyes is Nalepa of Vienna, who has given detailed descriptions and figures of many species. From Nalepa's work the black currant bud mite and the hazel bud mite stand as valid and separate species. As far as I know, there are no records beyond dispute of the black currant mite having been found in swollen buds of the hazel, although Mr. W. E. Collinge has recorded finding on two occasions in black currant buds infested with the black currant bud mite a few examples of the hazel bud mite. Mr. Cecil Warburton, with hazel mite common in his garden, has never found any in his black currants. An occasional avellanæ found in black currant buds proves nothing. What requires to be proved is that "big bud" in currants has been due to E. avellanæ. It must be remembered that identification of the two mites needs a high power of the microscope.

Summarising our present knowledge of the genus Eriophyes we may say:

1. That the species of the genus Eriophyes to a great extent confine themselves each to one food plant.
2. That some species of the genus Eriophyes are found feeding each on several species of the same genus of plant.
3. There are recorded cases of a species of Eriophyes attacking plants of different genera of the same natural order.
4. That examples of the same species of Eriophyes infesting plants of a different but related natural order are so rare as to be exceptional.

It still remains to prove from microscopic examination and experimentally that the same species of mite will infest plants of two different and not related natural orders, giving rise on these plants to the same kind of gall or damage.—R. STEWART MACDOUGALL, D.Sc., in the "Journal of the Board of Agriculture."

HARDY TREES and SHRUBS

OF ALL KINDS, including—

DECIDUOUS TREES for PARK, ROADSIDE, and GARDEN PLANTING, such as Limes, Planes, Elms, Oaks, Beech, Chestnuts, Birch, and others.

ORNAMENTAL FLOWERING and FOLIAGE TREES and SHRUBS, such as Almonds, Cherries, Peaches, Crabs, Lilacs, Thorns (Pauls' Crimson and others), Purple Beech, Golden Oak, Silver Maples.

EVERGREEN TREES and SHRUBS OF ALL KINDS, including large stocks of Aucubas, Hollies, Yews, and Conifers of the best varieties.

CHEAP EVERGREEN and OTHER SHRUBS for WOODS, COVERTS, and HEDGES, such as Spruce, Firs, Laurels, Privet, Quick, etc.

RHODODENDRONS (from loam) for GARDEN, PARK, and WOOD PLANTING.

HARDY CLIMBING PLANTS for WALLS, BUILDINGS, PERGOLAS, and OTHER PICTURESQUE PLANTING.

HARDY HERBACEOUS PLANTS in great variety.

Priced Descriptive Catalogue on Application.

The Principal Nurseries are Twelve Miles from London. The south entrance is four minutes' walk from Waltham Cross Station, and the west entrance is three minutes' walk from Theobald's Grove Station, Great Eastern Railway.
INSPECTION OF STOCK INVITED.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Syringing and Damping.

At this season of the year all plants under glass are growing freely, and it is essential to successful results that the growth receive such encouragement as will ensure its attaining to the highest state of development, of which it is capable. One of the chief encouragements to good growth is at the present time a moist atmosphere, and with but few exceptions, a liberal degree of atmospheric humidity in glass structures is necessary. This moisture may be provided by syringing and damping down, two operations that are well understood by those who have had any considerable experience in the cultivation of plants and fruits under glass. Syringing, when skilfully done, keeps the plants free from dust and vermin, refreshes them and assists materially in the maintenance of the requisite degree of moisture in the air. Damping down has its usefulness limited to its contribution to the atmospheric humidity of the structure. Yet its utility is great, for with its aid the moisture in the atmosphere can be maintained at such periods of the day and night when it would not be advisable to use the syringe, unless it be under quite exceptional circumstances. We need hardly say that it would not be advisable to keep the leaves of plants constantly wetted, and were they syringed when the sun is shining with full force upon the house, they would be seriously injured unless a heavy shade was applied beforehand. Damping down, which consists simply in pouring water over the floor and staging can be done at any hour of the day, whether the sun is shining brightly or not, and is therefore of much value in maintaining a moist atmosphere during the day when evaporation is proceeding at a rapid rate and the syringe cannot be used. The frequency of damping down must be determined by the class of plants grown in the structure and the state of the weather outside, and therefore no definite rule can be given. It may, however, be said that stove plants require more moisture in the atmosphere than do plants that belong to the greenhouse, and that damping down should be more frequent in bright, hot weather than when cool, dull atmospheric conditions obtain. Syringing is unquestionably the most important of the two operations, and some degree of skill is necessary in the manipulation of the syringe to ensure the whole of the plants being thoroughly moistened without water being used to excess, or the more delicate leaves being injured. Syringes, as so well known, are fitted with both jets and roses, but the skilful cultivator has a decided preference, and wisely so, for the jet. With this the operator can direct the water under or over the leaves, and regulate the force and fineness of the spray at will. The command over the syringe which the jet gives is a matter of considerable importance in the case of a mixed collection of stove plants, which vary so materially in the texture of their leaves. The use of the syringe must, of course be regulated by the classes of plants and by the weather outside; but, speaking in a general way, plants from tropical regions, and technically known as stove plants, and forcing houses should be syringed twice daily. The first syringing should be done early enough in the day for the foliage to become dry before the sun's rays have acquired sufficient power to injure the leaves, and it need hardly be said that the syringing must be done earlier in houses that have an east or south-east aspect, than in those facing south or south-west. In the afternoon the syringe must be used as early as the ventilators can be shut with safety for the purpose of enclosing as much sunheat as possible within the structure. No specified time can be given; but as a guide it may be stated that the house should have its ventilators closed early enough to conserve the sunheat, but not so early as to allow time for the condensation of the moisture on the glass to be dissipated before the sun has so far declined in power that there will be no risk from the exposure of the leaves to its rays. In practice this point is not difficult to determine, as all that is necessary is close observation extending over a few days. The syringing should immediately follow the closing of the ventilators, and at all times water of the same temperature as the house should be used. Not less important is it to use soft water, for when hard water is used there is invariably more or less disfigurement of the leaves.

MR. T. A. MORRIS.

Mr. T. A. Morris.—A very interesting branch of horticultural activity is the one devoted to valuation and sales by auction, and one of the most highly respected of those who "wield the hammer" is Mr. T. A. Morris, whose portrait we have much pleasure in presenting now to our readers. Although Messrs. Protheroe and Morris, of 67, Cheapside, do not devote the whole of their attention to horticulture, it is by reason of their regular sales of orchids and bulbs, and the big annual sales of nursery stock that they are most widely known. Some of the finest private collections of orchids have changed hands under the persuasive eloquence of Mr. Morris, and the well-known rooms at Cheapside have witnessed some quite remarkable scenes when some unusually fine odontoglossums or exceptionally rare species of orchids have been offered. All sorts of records for prices of orchids have been made and remade at Cheapside, and Mr. T. A. Morris has had his share in the making and the breaking of records. Mr. Morris's geniality has won him many friends, and he himself has not forgotten the claims of others, as for many years he was a prominent member of the committee of the Royal Gardeners' Orphan Fund.

Gardens Round Norwich.—In the issues of the GARDENERS' MAGAZINE for April 11 and 18 we shall describe and illustrate some of the many beautiful gardens in the district of which Norwich is the centre.

Raising Lilies from Seed.—In the United States, as in this country, the beautiful pure white lily (Lilium longiflorum Harrisi) is of great importance to those engaged in the production of cut flowers for commercial purposes, and also to private growers. The bulbs are largely imported from Bermuda and Japan, but, according to Dr. B. T. Galloway, the bulbs imported into America are not satisfactory. The problem, he states, of producing these bulbs in America has been studied by members of the staff of the Bureau of Plant Industry, and a summary of the results obtained shows that healthy bulbs can be readily and profitably produced from seed in that country, and that disease resistant strains can easily be maintained. On the suggestion of Dr. B. T. Galloway, Mr. Oliver grew a large number of seedlings in the Department of Agriculture greenhouses, and from these several pounds of seed resulted. This was distributed on the Pacific coast and in Florida. The seedlings grown in California showed conclusively that with liberal treatment first-class bulbs can be grown by this method much more quickly than by asexual propagation. The plants were almost free from disease. A few plants showed it here and there in first generation seedlings, but in the second and third generations it was difficult to find an affected plant. These results have been so encouraging to practical men in the last-named state that several are now engaged in raising a stock of seedlings upon a large scale. The officers of the Bureau appear to have had some difficulty in persuading the farmers that bulbs can be grown to a flowering size in twelve months, and to plant the seedlings out in the fields early in the summer at the distances necessary to enable them to attain their full development. According to the official reports on the experiments that have been made by the officers of the Bureau, many of the bulbs harvested at the end of the first year were from seven to eight inches in circumference, while two-year-old bulbs had a circumference ranging from ten to twelve inches.

A Curious Mushroom.—Mr. H. Harris, of Denne Park Gardens, Horsham, sent a mushroom having a second complete but inverted mushroom attached to the pileus to the Scientific Committee of the Royal Horticultural Society. The two had evidently become grafted together through contact in the early stages of growth, and the one had carried the other up as its stalk lengthened, wrenching it away from the mycelium which gave it origin, the water, etc., necessary for growth of the inverted mushroom having been carried through the tissues of the one still attached to its mycelium.

Rosa Willmottiæ, a Chinese species introduced by Messrs. James Veitch and Sons, through their collector, Mr. E. H. Wilson, is a very pretty, much-branched rose, bearing an abundance of small leaves, and rose-purple flowers. This new species is figured in the current issue of the "Botanical Magazine," and other subjects illustrated in the issue are Sinningia Regina, a species with pendulous violet gloxinia-like flowers; Cypripedium debile, a slender-stemmed orchid with small green, white and purple flowers; Pyrus Aria majestica, a very fine form of the White Beam tree, having leaves and berries larger than in the type; and Berberis acuminata, another Chinese plant originally discovered by the Abbé Delavay, it has narrow spiny leaves, bright yellow flowers, and black berries.

Enlargement of Ruskin Park.—A strong effort is being made to secure the addition of twelve acres to Ruskin Park, Camberwell. We have for a long time hoped that such an effort would be made, and successfully made. The Bishop of Southwark is chairman of the committee that has been formed for the purpose of securing this enlargement of a useful and pretty park, and we are glad to learn that the Southwark Borough Council is to contribute £700 towards the sum needed, and that the committee has received an anonymous gift of £1,000 towards the same worthy object.

Arbor Day at Eynsford.—On Saturday, March 14, Eynsford, the pretty village near Swanley, was en fête. It was Arbor Day. Ever since Jubilee year Eynsford has made Arbor Day one of its regular feasts, and, under the guidance of Mr. E. D. Till, much excellent planting has been done, and the village improved thereby. Mr. Till is as enthusiastic as of yore, probably more so, because now the villagers can see for themselves how the planting done in previous years makes the place more and more attractive. On Saturday last a group of poplars was planted to hide an unsightly railway yard, and the young ladies from the Swanley Horticultural College were among Mr. Till's most enthusiastic helpers. On the outskirts of Eynsford, at Farningham, Mr. Till dedicated a piece of land to the future tenants of houses that will be built on part of his property. This land is thus to remain open, and the future tenants will have good cause to bless Mr. Till for thus keeping open to them a pretty view across the Darenth valley. The day's proceedings included a procession, headed by a band, and a service in the church.

Mr. A. Simmonds, who for four years has been foreman at Stagenhoe Park, Herts, was, on leaving to take up the charge of Ystrad House Gardens, presented with a handsome marble clock by the employees on the estate as a mark of the esteem and respect in which he was held.

The "Journal" of the Kew Guild, just received, reached us much later in the year than usual. This is the fifteenth annual issue, and a very considerable portion of it is occupied by interesting letters from Old Kewites resident abroad. One Old Kewite, in Egypt, has a whole bagful of grievances to ventilate; he urges the association of the Kew Guild with the British Gardeners' Association, he wants the Guild to champion the cause of Kewites in Colonial service; he wants gardeners' grievances at home redressed; he wants the "Journal" to give notices of public companies formed in Europe for the exploitation of rubber, fruit, etc., and he wants the "Journal" cut adrift from the Kew staff in short, he wants a horticultural millenium, but, apparently, wants other folks to get it for him. Last year we suggested that the "Journal" had practically nothing to say about Old Kewites at home, the pages were devoted chiefly to letters from the Colonies and foreign countries, and to work at Kew and the doings and grievances of present Kewites. Pretty much the same must be said of the present issue, though, judging from an editorial note, it would appear that Old Kewites at home are either too busy or too modest to tell of their own doings. The frontispiece of the "Journal" carries a portrait of Mr. R. Irwin Lynch, of the Cambridge Botanic Gardens, whose portrait we gave in our issue of March 7; there is an excellent illustration of Cambridge Cottage, formerly a Royal residence, and now remodelled inside to render it suitable for a public museum. The other illustrations have a melancholy interest, as they are portraits of Mr. W. B. French, Mr. Alex. Aikman, and Mr. Leo Farmer, all of whom have passed into the great beyond all too early in life, after having done with their might what their hands found to do; Mr. W. A. Duncan and Mr. L. Kropatch, older men of good report, have also passed away, and the "Journal" fittingly records their good work.

R.H.S. Examinations. — Gardeners and others wishing to sit for the society's general examination in horticulture to be held on Wednesday, April 8, are requested to send in their names on or before March 28 to the secretary, Royal Horticultural Society, Vincent Square, Westminster, also the name and address of the proposed supervisor, together with postal order for 5s. in payment of entrance fee. The society is willing to hold an examination wherever some responsible person accustomed to examinations will consent to supervise one on the society's behalf. If any candidate desires to sit in London for this examination the society will make arrangements for him to attend at their hall in Vincent Square, S.W. The society will hold an examination in cottage and allctment gardening on Wednesday, April 29. This examination is intended for, and will be confined to elementary and technical school teachers. Those desiring to sit for the examination should apply at once for a copy of the syllabus.

"The Practical Greenkeeper" is the title of a freely illustrated brochure dealing with golf greens, tennis and croquet lawns, cricket pitches, bowling greens, and lawns in general and particular. It is issued by Messrs. James Carter and Co., Holborn, who inform us that our readers may obtain a copy of the work free, on application to them. We hope to refer again to this useful and interesting work.

A Children's May Day Show.—The Hayward's Heath Gardeners' Association has instituted a May Day exhibition for the children of the district covered by the association. Prizes will be given for garlands, and the display will be in Victoria Park.

Manchester's Gardens.—It is recorded that a country cousin waxed cynical over the gardens and plants of Manchester. He said, "Two things do well in the city, good reliable gravel and a privet hedge. You have to renew the gravel at intervals, but the privet will stand anything."

Trial of Melons at Wisley.—The following melons received Awards of Merit from the Royal Horticultural Society after trial at Wisley: Charles Ross (Ross), a medium-sized fruit, with green flesh. Duchess of York (Hurst), medium-sized, with white flesh, and yellow, heavily netted skin. Eastnor Castle (Barr), large, with green flesh and skin. Empress (Sydenham), large, with white flesh, and pale, well-netted skin; and Perfection (Sutton), large, with green flesh and skin, the latter finely netted. A First Class Certificate was conferred upon Sutton's Scarlet (Sutton), medium size, with scarlet flesh and bright golden and well-netted skin.

The Gardeners' Company.—An interesting little booklet, privately printed, and issued by Mr. W. T. Crosweller, a Past Master of the company, gives a chronological history from 1605 to 1907. It was in the former year that James I. granted letters patent to the "Commonalty of the Company of Gardeners." Mr. Crosweller records the doings of leading members of the company, but for some of the years he has nothing to tell, and in others he records matters of gardening interest, but not connected with the company's work: for instance, in 1656. John Tradescant "issued the 'Museum Trandescantianum.'" In 1657 "Evelyn, the diarist, visits the Physic Garden of John Tradescant the younger, at South Lambeth, afterwards made famous by Parkinson and Johnson." In 1786 "Covent Garden consisted of stalls in the open square." In 1804 "Sir Joseph Banks, P.R.S., Thomas Andrew Knight, F.R.S., and others founded the (Royal) Horticultural Society of London." In 1839 "the Royal Botanic Society's gardens established," and in the same year a meeting was held in the Strand "to form a 'Benevolent Fund' for the relief of Destitute Gardeners,' was the beginning of 'The Gardeners' Royal Benevolent Institution.'" And in 1887 "The Royal Gardeners' Orphan Fund established." About 1890-91 the company began to arouse itself, and in the latter year the honour and privilege of the Livery of the City was granted. In 1892 Sir Trevor Lawrence, Bart., became Master, and horticultural scholarships were instituted in connection with the R.H.S. examination in horticulture; Baron Schroder contributed the money for the first scholarship. In 1893 the Rev. W. Wilks became Master, in 1896 and 1897 Mr. N. N. Sherwood, V.M.H., was Master, and in 1899-1900 the late Mr. Philip Crowley was Master of the Company. Mr. Crosweller was Master in 1907. Since its resuscitation the company has made numerous donations to the gardening and other charities.

American Gooseberry Mildew. The Government of Holland are following the example that has been set them in this country, and are taking active measures with a view to stamp out the American gooseberry mildew. For the assistance of Dutch cultivators in combating the disease a brochure, prepared by Dr. J. Ritzema Bos, has been published. This is comprehensive in scope, well written, and admirably illustrated, the illustrations including a plate in colours showing the effect of the disease on the growths and fruits.

Colorado Pines.—In an interesting contribution to the "University of Colorado Studies," Mr. F. Ramaley shows how the pines are found at certain altitudes. Grass lands rise to 6,000ft., followed by Pinus scopulorum and P. mucronata; then comes a zone of P. Murrayana, with P. flexilis, and above these is a zone of Engelman's spruce. Higher still the only woody plants are dwarf willows.

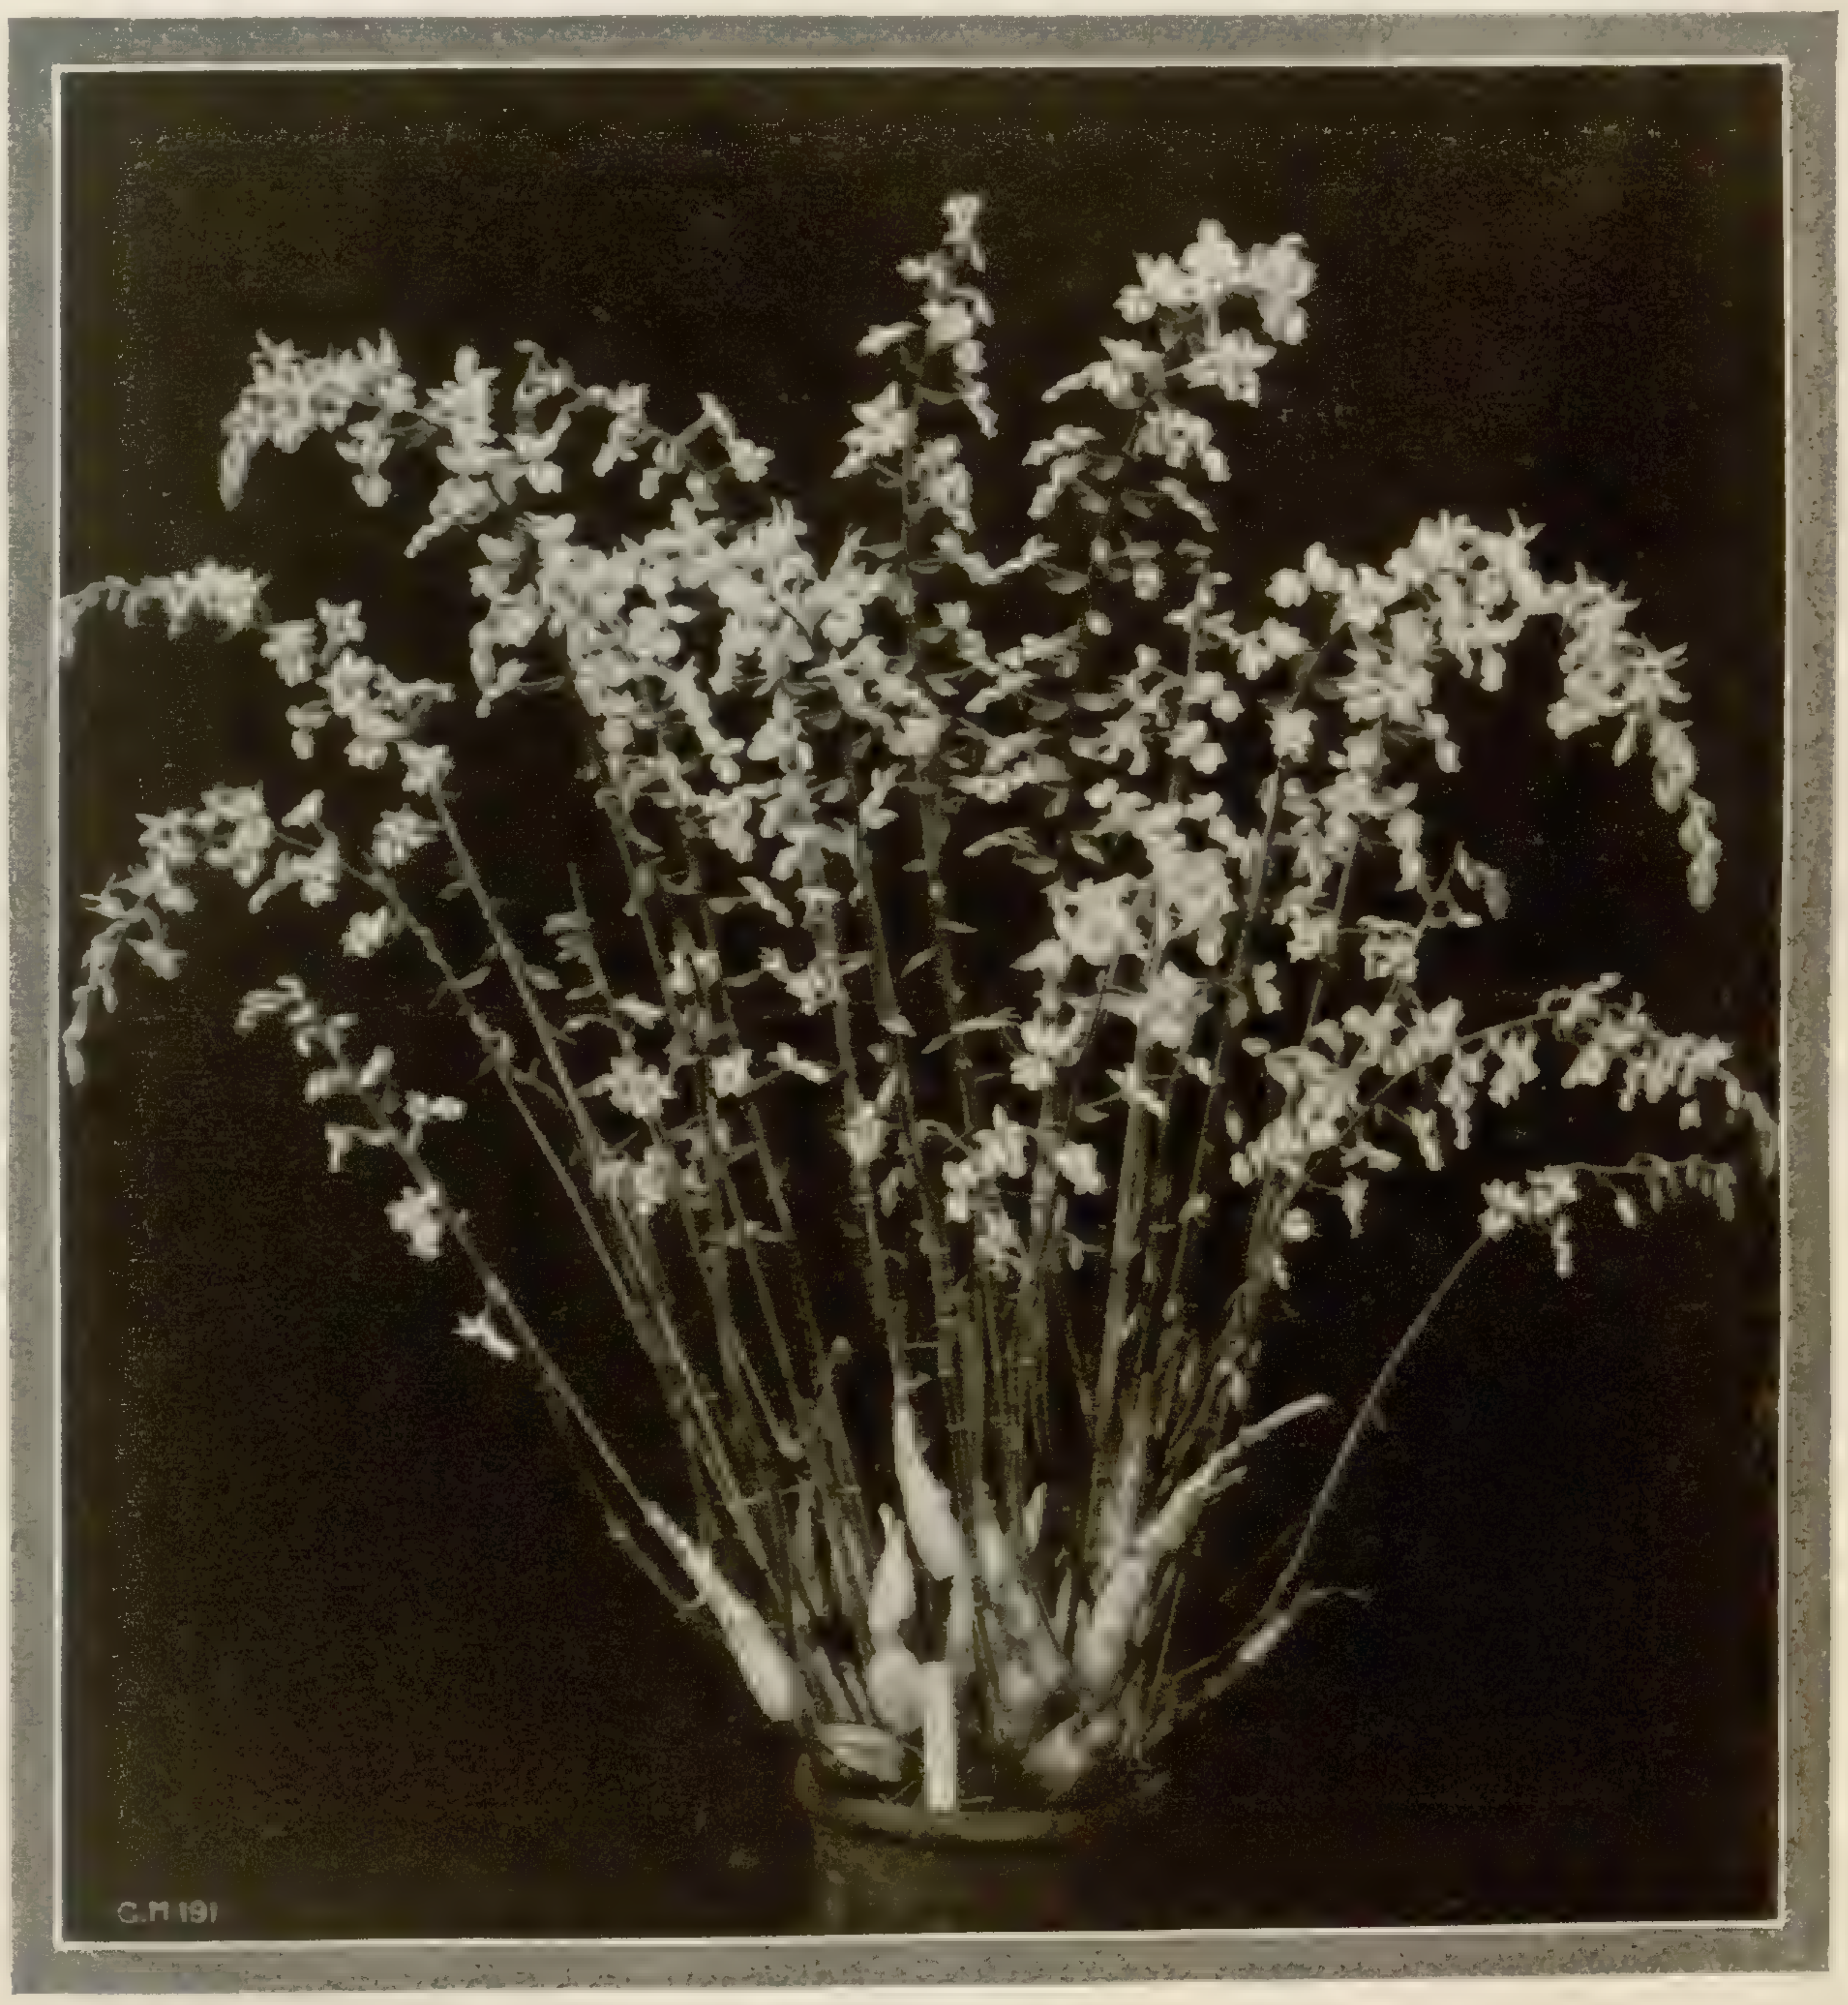
Begonia Rust, Etc.—Mr. R. H. Curtis sent leaves of Begonia Gloire de Lorraine with rusty spots and markings due to the attack of the begonia mite to the R.H.S. Scientific Committee. This pest is difficult to eradicate, but constant vigilance and fumigation whenever necessary will usually keep it under. A good wash for dipping plants attacked by mites is made by kneading a handful of soft soap with a quantity (indefinite) of flowers of sulphur and dissolving the whole in one and one-half gallons of water, but even this, probably the most deadly wash for mites, and at the same time harmless so far as the plants are concerned, is not always efficient in killing the eggs of the mite.

Nitrate of Soda on Wet Soils.—We are so apt to regard nitrate of soda as one of the finest manures for increasing the bulk of a crop that we are apt to forget it has an opposite effect under certain conditions. In Japan it has been found that the use of nitrate of soda in swampy soils reduces the yield of rice; this is due to denitrification, which process gives rise to poisonous nitrates, and thus the crop is harmed instead of being benefited.

CALANTHES.

(Concluded from page 186.)

As growth becomes more advanced, and root action active, more water will be required, but this ought not to be given in such quantities as to sour the soil. When the soil becomes permeated with roots weak liquid manure is given each time the plants require watering, and they are syringed daily to keep the foliage clean. We have no special house for growing calanthes in; our plants are grown on the north side of the melon houses, where the temperature during bright weather is often considerably over 100 degrees. They are, however, always kept shaded, as the dense foliage keeps off the sun, and they are syringed at the same time as the melons. The liquid manure we use is obtained from the farmyard, and this is diluted and given in quantities when the soil is filled with roots.



A SPLENDIDLY GROWN SPECIMEN OF CALANTHE VEITCHI.
Flowers bright pink.

Staking is an operation that is overlooked by most amateurs, and not a few professional orchid growers fail to see the necessity of staking the young growths of calanthes. Some may even laugh at the idea, and consider me a faddist to suggest it. But allow me to say that if the finest results are to be obtained the young growths must be kept in an upright position from the time they commence to grow until growth is completed, and this is impossible unless some support is afforded. The long, broad, plaited leaves are sure to pull the growths on one side, and when this happens the plants receive a check from which they do not recover. I am here alluding to well-grown bulbs, from fifteen to eighteen inches in length, carrying from six to eight leaves, each three or more feet in length. The larger the bulbs the greater the risk of their snapping off at the neck, near the base, by the weight of the leaves. It was a misfortune of this kind to some of my best bulbs that induced me to stake the growths very early, and since adopting this method I had not lost a bulb in the growing season.

With bulbs of the size suggested staking becomes absolutely necessary. Care, however, must be exercised, otherwise more harm than good will be done. The stakes should be so placed that they do not interfere with the swelling of the bulbs, and the ties must be loose and under the top ring of foliage. The plants should be frequently looked over to see that none of the ties are strangling the growths, as they swell very rapidly at this stage. Better err on the side of examining them too often than have any of the growths spoiled. If these details receive due attention the crop of flowers produced will well repay the cultivator for his pains.

Some growers recommend withholding water as soon as the flower spikes show themselves, but this I regard as a mistake. Here the plants are kept watered until the flowers are cut, and often the foliage is quite green when the blooms are expanding. The reason there is none on the specimen illustrated is because it was cut off at the time the photograph was taken so as to show the bulbs more plainly.

Well-grown calanthes will bloom from the middle of November until February, for though the individual flowers do not last very long, fresh ones keep opening, and on that account they are among the most useful of plants it is possible to grow. Our plants, though in full bloom in November, were in perfection in January, thus showing the length of time strong spikes will keep on flowering. When cut and put in warm rooms the flowers usually continue fresh for about three weeks, providing the water is changed occasionally, and the lower portion of the stems cut off to enable them to take up a supply of moisture. When kept in the plant house a warm, dry atmosphere is necessary, and in this they will continue blooming for a long time.

Those who have not grown C. bella and C. Harrisi would do well to give these a trial, as they are by far the finest calanthes. The former is a beautiful light pink variety, having a dark throat. It was raised some years ago by a friend of mine, who sent me two very small bulbs, not much larger than a snowdrop bulb, but the stock from these has so developed that at the present time some of the flower spikes are much thicker than the original bulbs were. C. Harrisi, I am told, was raised by the late Dr. Harris, and was named after him. The flowers of this are pure white, and about two inches in diameter. It is of robust habit, producing both bulbs and flower spikes of the superba type, and not with the "neck" which is so conspicuous in C. Veitchi and C. bella. The flower spikes are stout, growing from three to four feet in length, and having the flowers more closely together than in C. Veitchi.

Before closing I must say a word or two about C. vestita and its varieties. These form most lovely subjects for hanging baskets. When grown thus, about a dozen or eighteen bulbs should be planted in each basket, according to their size. Strong bulbs will produce spikes from a foot to eighteen inches in length, and these, hanging gracefully all round, make fine specimens for entrance halls or other places where they can be suspended.

Some growers are troubled with "spot" on the foliage, but with the exception of some "spot" on bulbs from another place that pest is unknown here. My opinion is that the chief cause of the disease is keeping the bulbs in a low temperature and damp atmosphere. With us the plants soon grow out of the disease should it be present when new plants are introduced.

H. C. PRINSEP.

Buxted Park Gardens.

PREPARATION OF SUMMER FLOWERS.

A gardener, whether amateur or professional, may have thousands of bedding plants ready for putting out in May, yet possess none that do him credit, and the ultimate appearance of the flower-beds may be poor. It is from the best grown plants that the finest flowers, both as to size and colour, are obtained. Perhaps a sense of haste, perpetual hurrying, is the cause of most failures in all branches of gardening. It may—nay, often does—exist with keen devotion to work, none the less is it among the worst of faults. A bed too sparingly filled with fine plants gives a better effect than a lavishly replete one of unhealthy subjects. Hurry in seed-sowing results in over-crowded seedlings, which are pricked out roughly, the weakliest and latest, so often the most valuable, being sacrificed, and further shiftings not performed with sufficient patience, cause the loss of many more. Inadequate hardening off, and neglect of pinching into shape, are other shirkings due often to haste.

The gardener who estimates fairly correctly how much seed he ought to sow to well furnish the pleasure-grounds, spares himself much unnecessary work, and saves the time, too, of his subordinates. He will gain more credit by trying a few novelties than by raising great numbers of ordinary varieties of bedding plants.

Polygonum orientale is a fine hardy annual that gives little trouble, may be raised in cold frames, and is not generally known. As its pendant carmine blossoms appear late in the summer and autumn the plant may well be accompanied by some that flower only in May and June, a succession of beauty being thus provided. The height is fairly uniform, about three feet, and there is a less effective white variety that can be recommended for contrast.

A remarkable ricinus is R. panormitanus, by reason of the blue stems that support its immense leaves; for sub-tropical effects it is admirable, in sunny, fairly sheltered spots, and grows symmetrically to a height of six feet.

The half-hardy annual rudbeckias are pleasing, and easy to raise in quantities from seed-sowing in heat in spring. Rudbeckia bicolor superba has regular brown spots on golden petals, and the double variety of this attracts much notice at shows or from visitors to the gardens. R. bicolor, a more usual representative of the class, has a dark zone in gold blooms, and flourishes in hottest positions. The height of all is under two feet.

Salpiglossis are seldom used to best advantage; they need to rise well above a thick undergrowth of contrasting coloured foliage or blossom, instead of being congregated by themselves in mixed tints. The branching growth of a fine salpiglossis plant set by itself produces an effect to remember. Why should the popular foliage zonal pelargoniums and fuchsias not be employed with self salpiglossis, the latter set at wide intervals? Of all the separate seed varieties coccinea is the most vivid, but charming also are rosea and aurea.

A small plant of infinite service for carpet bedding or edging is Silene pendula compacta Empress of India, as no green appears in it, the flowers being crimson and stalks and leaves deep maroon-purple. The dwarf white Silene p. c. Snow King is a perpetual bloomer, more effective than most other dwarf plants.

Instead of the usual African marigolds choice might be made for one season of the double quilled type, Tagetas erecta fistulosa; if well treated, by being carefully raised and allowed sufficient depth of rich soil and enough space when in the beds, this tagetes produces blossoms of immense size and excellent quality. By the by, no marigolds are so fine as those which are planted in maiden loam enriched with a mulch of almost fresh horse manure. Tagetes patula pygmæa I have found a most useful six-inch French marigold for carpeting beds of the tall Africans. Another vivid flower, orange in shade, is that of the nine-inch Venidium calendulaceum, a half-hardy annual. Among zinnias a feature might be made of the giant white Z. robusta, Queen Victoria, and the double orange variety of the dwarf Zinnia Haageana in combination. Gardeners have long been of opinion that Nemesia strumosa would only be an admirable bedder when obtainable in separate seed varieties. Now in Nemesia strumosa Orange Prince we have a level grower, of fine and constant blossom.

Schizanthus Grahami niveus will supply a double need, that of an elegant foliage plant and a free white bloomer. It should be used with a surrounding belt of Phacelia campanularia or Scarlet Begonias whose compact growth will add to its graceful effect, or with any three-foot centre plants that need to have their lower stems and leaves well veiled.

M. H.

Venidium calendulaceum.—Were I asked to name the best six annuals for giving a prolonged and bright flowering display, with the least trouble, Venidium calendulaceum would certainly be one of the six. In good soil every plant will cover from two feet to a yard square with its bold and handsome foliage, and on top of this, from one foot to eighteen inches high, it will rear hundreds of fine flowers, larger than a five shilling piece, and showier than a sunflower. One fault it certainly has, and that is it retires to rest each afternoon earlier than one would like. Otherwise, it blooms till November in fine seasons, and gives cut flowers galore for months. It can be sown out of doors at the end of March.—E. J. K.

Iris alata.—The scorpion iris, as this species is named, is the earliest of all the bulbous irises to flower, often expanding its blossoms before the close of the year. It was introduced from Algiers about 100 years ago. In the type the flowers, which are four inches across, are lilac-blue in colour, with falls one and a-half inches in breadth, marked with a central yellow crest that is reticulated with white on either side. As with many of the bulbous irises, the species is very variable, and there are many named varieties. The great drawback to this iris is that it often proves most difficult to flower, and in numbers of gardens refuses to bloom after the first year, though throwing up healthy foliage year after year. It is no uncommon thing to see a clump in apparently perfect condition that is said never to have flowered for six or eight years. An amateur who has suffered from the non-flowering of this iris, now imports bulbs every year, and throws them away after they have bloomed.—S. W. FITZHERBERT.

NOTES FROM CEYLON.

The Mangosteen.

The Mangosteen (Garcinia Mangostana) is the fruit par excellence of the Eastern Tropics. It is a native of the Malay Peninsula, and grows and fruits well in the moist low-country of Ceylon, Trinidad, and Jamaica. It does not thrive well in India, and has not as yet become quite established in the tropics of Africa and America, where, however, frequent attempts have been made to introduce it. The tree requires a moist, hot and equable climate, such as is found in certain equatorial regions only. The fruit is round, two to two and a-half inches in diameter, with a tough thick rind; it is first green, then gradually changes to pink, and finally to a rich deep purple when ripe; inside, the fruit is divided into edible segments, which are snowy white in colour, delicious in flavour, and of a delicate melting consistency. These segments are from five to seven in number (always indicated by the number of stigmatic scars on the rind) and contain a seed each. Usually only one or two of the seeds in a fruit are properly developed. The flavour of the fruit is said to suggest something between the grape and the peach. The Mangosteen tree is of a small branching habit, very slow in growth, and taking eight to twelve years or more to come into bearing. It is on this account not a very suitable tree to grow in costly conservatories in England. The tree has, however, been fruited in the conservatory at Sion House, an achievement which any horticulturist in Europe might be proud of.

Randia macrantha.

This is a particularly striking shrub (or rather small tree) when in flower. The peculiar long funnel-shaped flowers, bending down with their own weight, are borne in great profusion, literally smothering the foliage. These are at first creamy-white, afterwards becoming pale yellow, and are somewhat pleasantly scented. The tree is a native of West Tropical Africa, and like many other fine-flowering species of the tropics, belongs to the natural order Rubiaceæ. Through a misprint it is wrongly given for Randia maculata in the Kew Hand List of Tender Dicotyledons as being figured in the "Botanical Magazine," t., 4,185. Randia macrantha used to flower in the palm house at Kew, but it is seldom met with in private collections in Europe.

Flying-foxes.

This illustration, from a photograph taken by the writer, in the Royal Botanic Gardens, Peradeniya, Ceylon, will convey some idea of a pest which is found in certain tropical countries. The animals seen here on the wing are not birds, but mammals, furnished with large wings and a brownish-yellow hairy coat; they are popularly known as Flying-foxes, owing to the close resemblance of their head and body to those of a fox.

These huge bats (Pteropus Edwardsii) are of a gregarious habit, congregating in enormous numbers on specially favoured lofty trees, to the top branches of which they suspend themselves by the feet and rest during the day with their heads downwards, right in the blazing tropical sun. Being of a frugivorous nature, and of nocturnal habits, they roam at night in search of fleshy fruits, being particularly partial to ... fruits of almost all kinds. They quickly defoliate any tree of which they take possession, and seem to prefer a tree which has thus become completely devoid of foliage and shade. The flying-foxes have a very offensive odour, which is noticeable for a considerable distance, especially on the windward side. They are of interest to naturalists on account of the parasitic fleas which always infect their bodies. When stretched the flying-fox measures from three and a-half to four feet from tip to tip of the wings.

RANDIA MACRANTHA IN THE PERADENIYA BOTANIC GARDENS, CEYLON.

THE MADEIRA ORCHIS.

Among the hardy orchids none of the orchises compare in beauty with Orchis foliosa, a native of Madeira, save, perhaps, the fine Kilmarnock and Glasnevin forms of O. maculata, while it is, moreover, even more easily cultivated than these noble plants. It is also more effective in its greater stature, while its handsome leaves, which give it the specific name of foliosa, or leafy, add greatly to the numerous good points it reveals to the student of beautiful flowers.

So easy is it to cultivate that one is always surprised that this fine plant remains so comparatively expensive. It may occasionally be purchased for half a crown or so, but the general charge for a good strong root is about three shillings and sixpence. Yet, although this is a rather high price for a plant which has so long been in cultivation, it cannot be said that it is beyond the plant's intrinsic value, as it is certainly better to pay a good price for a first-class subject than to have ten or a dozen inferior ones. Orchis foliosa is one of the really good flowers, which all who desire to own the élite of hardy plants should possess.

This fine plant grows from eighteen inches to three feet high, the latter height being reached in the good and rich soil which it enjoys, and I have seen it even taller in good gardens where its requirements were carefully studied. The leaves, as already indicated, are handsome, being long and broad, and of a pretty green; while the stout spikes of flowers are densely crowded with many rich purplish-red blooms.

The flowering time is generally from June to July, but it is later in some parts where early summers are not the rule. It is, however, hardy almost everywhere in the United Kingdom. I have seen it employed occasionally as an exhibition flower, but many shows are held too late for staging this handsome orchis. It likes a good, rich soil, preferring one of a heavy character with a fair amount of moisture in it, but a peaty one is preferable to one of a dry nature. I prefer planting this orchis in spring rather than autumn, and roots can still be secured and planted with advantage. A good clump will throw up several flower spikes, as it is not one of the plants which seem to flower more sparsely when crowded with growths. Divisions should be effected in spring.

S. Arnott.

SWEET PEAS IN CLUMPS.

The clump system of growing sweet peas has made amazing strides during recent years, and even exhibitors, with whom garden decoration is quite a minor consideration, now largely adopt the practice. For garden decoration pure and simple, the old style of growing in rows cannot for one minute compare with clumps; for one thing, it is altogether too set and formal for present-day tastes; for another, it is positively ugly in some situations.

As a hedge of irregular outline a row of sweet peas is a not to be despised feature of a flower garden, but even then the row should be a double one, with the component lines eighteen inches apart, and the sticks slanted outwards at the tops—not inwards to meet. Such a hedge will give a billowy mass of flowers a yard wide and two yards high. This is to be a hedge proper: an unbroken line from start to finish.

Where a background, as distinct from a hedge, is wanted, the clump will be found more pleasing than the unbroken row. By its aid distinct and fairly solid masses of colour can be arranged, each complete in itself, instead of half losing itself in association with its neighbours. More flowers will also be yielded from a given space, and cultural operations performed with less difficulty.

For filling blanks in shrubberies or in herbaceous borders the clump of sweet peas scores heavily, as it can be expanded or compressed to meet the exact exigences of the case. For these clumps good contrastive colours should always be chosen; something which will show up well amid the surrounding greenery in the shrubs, or stand out boldly by itself in the herbaceous border. Creams—yellows as they are fancifully called—whites, pinks, and orange, and light reds are the best colours in general, and in shrubberies it will be found that even such delicate varieties as Henry Eckford and Helen Lewis will not scorch and spot in the sun, but appear in almost their true colours.

The blues, magentas, and maroons are the most hopeless in shrubbery borders. Light blues—like Zoë and Flora Norton—are not so bad, but Horace Wright, Navy Blue, Nigger, and others of that ilk are great failures from the point of view of decorative effect. I saw these identical varieties so used last year, and the failure was most complete. The lavenders and mauves want shrubs or objects near them to foil and throw up their colours, and when this is done, such as Frank Dolby, Lady Grizel Hamilton, and Mrs. C. Foster are really lovely.

But, all things considered, whites, pinks, and reds in various shades are the best and showiest for any position where a telling effect is required. A good selection would include Dorothy Eckford and Nora Unwin, white; Countess Spencer, Mrs. Alfred Watkins, and Queen of Spain, pink; Miss Willmott and Helen Lewis, orange; George Herbert and E. J. Castle, rose and carmine; Mrs. Collier and Hon. Mrs. Kenyon, creamy-yellow; Triumph, rose and blush white; Queen Alexandra, scarlet; and Coccinea, a unique shade of red.

For these shrubbery clumps, and for other parts of the garden where bold effects are required, as many as twelve plants per clump may be allowed. This will give a mass of flowers quite six feet through, if the plants are kept—as they should be—one foot apart all round the circle, and the stakes are inclined outwards. Persons who have had no experience of this phase of sweet pea culture invariably sow seeds or set out plants in the centre of these clumps as well as round the circumference. This is quite a mistake, but one that is scarcely likely to be made twice, as the inner plants are smothered by the outside ones, and are simply wasted.

[Photo: H. F. Macmillan.

A PLAGUE OF FLYING FOXES IN THE PERADENIYA BOTANIC GARDENS, CEYLON.

For backgrounds or avenues of clumps, or where this system is followed for producing exhibition flowers, from four to six plants per clump are sufficient. Under a liberal exhibition régime a clump of four plants will make an astonishingly fine display, quite a yard through, and this will be found quite large enough for the careful tending that such plants require. With six plants a good clump is ensured in any well dug and tilled garden soil. Recently there has been some disposition to use two varieties of different colours in one clump, but a thorough knowledge of the varieties used is required, and a vivid recollection of their true colours, or the result is apt to be—well, unfortunate. I should certainly advise all beginners to stick to one variety per clump, and on no account to make up clump mixtures from catalogue descriptions alone.

As I have already digressed from my title with regard to rows and hedges, perhaps I may be allowed a little further digression to refer to sprays. These are admirable where there is not room for a clump, or where a strictly limited but flat-faced display is wanted.

The soil in such a position should be deeply dug and well manured, and in due time a seed should be sown or a plant set out where it is likely to grow best. After assisting the plant with a twig until it is two or three feet high, a stout hazel bough six feet high, somewhat fan-shaped, and as twiggy as possible, should be introduced. On this the plant is trained, giving it a tie or two to keep it in position at first. If much space is to be covered pinch the point out of the plant, and train the growths obliquely; a good plant will easily cover a space a yard wide.

Mention of training reminds me that this is a somewhat necessary accompaniment to clump culture. If left to themselves the growths have a marked penchant for getting inside the ring of stakes, and if not detected in the act they drop down inside eventually and are wasted. To guard against this, the cultivator at the time of fixing the final sticks carefully draws every plant to the outside of the circle, and ties it where he wants it with a piece of raffia. Generally this first tying will suffice, as the plants are, or should be, somewhere near a yard high at the final staking. Growths which subsequently try to force their way inwards should be gently withdrawn, and so conducted round adjacent twigs that they and their flowers are kept on the outside of the clump.

As a general rule, hazel boughs are the best supports for sweet peas in clumps; they are twiggier than any others, and are generally quite high enough and strong enough for garden sweet peas. Under special culture, however, the plants run up to a great height, and in these circumstances I have found chestnut boughs far the best. They can be obtained of almost any height, and with stems for inserting in the soil almost as thick as a man's wrist, by ordering them of the woodman. In wooded districts they should always be used when obtainable.

In towns wire netting has a great vogue for sweet pea clumps, and gives excellent results. It is secured to three or four stout poles driven in near the plants, and two widths of netting are used, one on top of the other, when height is desired. Whatever its other merits, wire netting is inferior to sprayey boughs from an artistic standpoint, and, in my opinion, should only be used where boughs are not forthcoming. Its aggressive shininess may be toned down with dark green paint, and then it is not such an eyesore.

E. J. Castle.

HARDY ANNUALS FOR CUT FLOWERS.

How inestimably valuable hardy annuals have become may be judged by their yearly increase in popularity. Their presence in garden decoration is very helpful, and as they are in constant request as cut flowers during summer and autumn, it is difficult to place limitations upon them.

The cultural details are readily mastered even by the novice, probably the chief stumbling-block to which even skilful cultivators not infrequently succumb is a too lenient hand in thinning the seedlings. To secure the brilliant flowers with long stems so much in request at present, a drastic system of thinning must be early practised. Sturdy grown plants yield a long season of flowers when each individual is given sufficient room for lateral development. Most of the annuals named can be sown in the open ground, a practice which answers admirably for successional plantings or late supplies, but to secure early flowering resource must be had to sowing in boxes or cold frames.

Any light soil, such as old potting soil, answers for seed sowing, and March and April are the accepted months for sowing during spring. The seedlings must be grown sturdily from the beginning, and when three or four inches in height they are planted into their flowering quarters in bed, border, or shrubbery as the case may be.

During the winter or early spring the ground is prepared by digging and manuring, though moderately rich soil yields the best flowering results, it being always easy to give extra stimulants as the plants require it by means of approved fertilisers supplied as a top-dressing. A dozen good annuals for supplying cut flowers, taken in alphabetical order, includes:

Asters of the Comet, Mignon, and Queen of the Market types. These give double flowers with comparatively long stems, and are useful for church decoration and invaluable where large supplies are required for despatching to sales held for charitable purposes. The improved forms of the single sinensis are probably most appreciated, as they lend themselves to lighter arrangements and their flowering season covers a longer period than others.

Calliopsis Drummondi and C. nigra speciosa are most useful for small glasses, and they stand fresh a long time when cut in the bud, the black maroon flowers of the latter are most effective by artificial light and contrast well at all times with the bright yellow blossoms of Drummondi.

Centaureas should be represented in gardens by the beautiful varieties introduced by Messrs. Jarman and Co. These embrace white, lemon, yellow, and heliotrope flowers, and are the finest type obtainable. The plants are characterised by great vigour and enormous stems, so that one can readily foresee a popularity for these annuals second only to the sweet pea.

Annual chrysanthemums are the brightest and most refined of all the Corn Marguerites, they last well when cut, and are also bright subjects when massed in bed or border. The single varieties are all good, though some of them are very old garden plants, two new varieties, named Morning Star and Evening Star, should be given a trial.

Eschscholtzia californica supplies the brightest and most refined orange-yellow colour among annuals; it is invaluable for light dry soils, and succeeds to perfection upon chalk soils, and the flowers, when cut, are valuable for small glasses.

Godetia Schamini fl.-pl., which appeared as a leading novelty a few years ago, has in a large measure supplanted the single forms. The flowers are a bright rosy-white, borne freely upon two-feet-long stems, and they last well in a cut state.

Gypsophila elegans grandiflora is the counterpart, among annuals, of Gypsophila paniculata, and is suitable for associating with all cut flowers when lightness and elegance are most desired.

Helianthus cucumerifolius is chiefly valuable for its cut flowers during autumn; these are in yellow and lemon shades, and the flowers have a conspicuous maroon disc in the centre giving to them a striking effect. The varieties Diadem, Orion, and Stella are most generally grown.

[Photo: H. F. Macmillan.

MANGOSTEEN FRUITS (GARCINIA MANGOSTANA).

Lavatera trimestris is a vigorous growing annual, often attaining a height of 5ft. The flowers are self coloured, either rose or white, and are invaluable for furnishing large vases. Early flowering plants come readily from seed sown in autumn.

Mignonette is generally esteemed for its fragrance, and the bold vigorous spikes produced by recent development in this popular annual are strikingly shown in the variety named Bismarck, which has the further virtue of remaining in flower well into the autumn.

Nigella, or, popularly, Love-in-the-Mist, has met with considerable improvement in the variety Miss Jekyll. The colour is a decided blue, and the flower is surrounded by threadlike leaves, which give it a quaint and pretty effect. Unfortunately the plants seed so freely that the constant removal of seed pods is imperative or the plants soon become exhausted.

Stocks are sweet-scented old-fashioned annuals which are almost indispensable. Since the introduction of Beauty of Nice and Princess Alice their cultivation has been greatly extended, as these varieties furnish flowers with long stems; of a beautiful rose or white colour respectively.

Schizanthuses have not inaptly been named the poor man's orchids. They may be had in flower in pots by Easter, if given the protection of an ordinary greenhouse, while their flowers may be enjoyed in the open garden throughout summer and autumn. Wisetonensis is a bright subject, and probably the most useful for cut flowers. Thomas Smith.

Walmsgate Gardens, Louth.

Planting Out Old Marguerite Carnations.—I believe most growers throw these away after flowering them in pots, and I have done the same, to the extent of many hundreds. However, an old garden labourer taught me a far better use for these oldsters, for he rescued a few plants from the rubbish heap, and in the summer had such a bedful of carnation blooms as one seldom sees. If a little care is taken of the old plants after they have flowered indoors, they will give baskets and baskets of bloom when planted out on a sunny peach or other border in the kitchen garden.—E. J. K.

CUCUMBER CULTURE IN PITS AND FRAMES.

When one is fortunate enough to possess brick pits provided with both top and bottom hot-water pipes capital crops are easily produced quite early in the season, and later in the year. During the hottest part of the summer, without pipes, and with only the aid of the glass, first-rate results may be obtained. The principal disadvantage, as compared with those grown in houses, is attending to the plants during inclement weather. Consequently advantage must be taken of favourable weather for giving them any attention they may require. As in the case of those grown in houses, it will be advisable to provide a fair depth of fermenting material, sufficient, in fact, to create a gentle warmth and give the plants a good start, and indeed to maintain them in a vigorous state of growth until they are well established.

Thinning, stopping, pegging down, arranging the growths, and top-dressing should receive constant attention. The plants should always be allowed sufficient room to develop without the foliage coming in contact with the glass.

Ventilation is perhaps one of the most important points in cucumber culture in pits and frames. Air should be admitted quite early in the morning, if ever so little, but the lights may be closed and the growths well syringed with tepid water quite early in the afternoon, retaining as much sunheat as possible. The leaves are seldom burnt during the latter part of the day. It is generally quite early in the morning that injury is done, when no air has been given. Thoroughly mat the lights during cold nights.

Black fly and red spider are generally the most troublesome insect pests. Frequent slight fumigations with some approved material will keep them free from aphis, and a moist atmosphere is of immense value in repressing red spider.

Portable Frames.

Upon the assistance of hotbeds only many have to rely entirely for their supplies. And by judicious care and management with the aid of this very excellent fruits may be cut every day through the summer and early autumn. These require treating much in the same way as when grown in pits, except that occasionally relining the frames to create additional warmth will be required.

Outside Culture.

Even where no glass at all is available many amateurs and cottagers may successfully grow their cucumbers quite in the open. Choose the warmest and most sheltered part of the garden. The Improved Ridge varieties are, in my opinion, quite equal in flavour to any grown under glass when good culture is given them. I have always found these best when grown in beds on ridges of leaves and manure, though many prefer to grow them on the flat. The seeds are best sown in pots, and planted out about the first week in June in any fairly good soil. The young growths will need pegging down occasionally, and in the early stages provide a little shelter at night when cold. Spruce boughs answer the purpose well. Black aphis sometimes proves troublesome, and immediately this is noticed take the precaution of syringing at once with a reliable insecticide. Keep the roots well supplied with water, and damp over the foliage every fine afternoon, and mulch between the growths during very hot seasons with half-decayed horse manure.

Varieties.

There are now many excellent kinds, and many cultivators make their own selections. I can strongly recommend Matchless and Ideal both for home use and exhibition, and when a medium sized fruit only is in request Lockie's Perfection is all one can desire. Improved Stockwell Ridge is one of the best for open air culture.

A BED OF CALCEOLARIA BURBIDGEI AND VERBENA MISS WILLMOTT AT HAMPTON COURT.

SOME SUGGESTIONS FOR FILLING LARGE BEDS.

Those who have visited the famous old gardens attached to the Cardinal Wolsey's historic palace of Hampton Court cannot fail to have noticed during recent years how the summer bedding has differed from what was regarded previously as the correct thing. When carpet bedding was the height of fashion the flower beds at Hampton Court were large, intricate, gorgeous, and well kept, but these gave place to less formal and flat designs as the years advanced, and during the time Mr. J. A. Gardiner had charge a still freer style was adopted, and carried out in a most effective manner.

From time to time the summer displays at Hampton Court have been described in these columns, and many of the examples of good bedding out have been illustrated. Two further illustrations are now given, as they will serve as suggestions to those who have large beds to fill in a new park or garden. The first view shows a big bed of the free-flowering Madame Crousse ivy-leaved pelargonium, margined with a broad band of the dwarf white alyssum. The pelargoniums were about a yard high, and perfect pillars of graceful greenery and pink blossoms. In the other bed illustrated, the chief feature was Calceolaria Burbidgei, and as this plant grows luxuriantly, and produces an abundance of soft yellow flowers, the specimens were set well apart. The edging in this case was of light blue ageratum, and the groundwork consisted of the pink Verbena Miss Willmott.

Mr. Gardiner, who now has charge of Hyde Park, tells us that the best plants for producing the specimens for these big beds are those from cuttings put in the previous autumn, and grown on steadily through the winter and early spring. These have far more vigour, and produce finer flowers than old plants kept over from year to year.

C. B

IMPROVING AN ORCHARD.

From an experiment conducted by the Rhode Island Experimental Station since the year 1899, for the purpose of trying what could be done to restore a neglected orchard to fruitfulness, the following facts have been deduced. The orchard consisted of about one acre of land, containing many varieties of apples which had been planted about twenty-five years. When work began in 1899 the trees looked very unpromising, they had made little growth, and the trunks were covered with lichens or moss. No fruit of value had been produced for several years. The treatment given to the orchard was such as any fruit grower might afford.

The first thing done was to scrape off the rough loose bark from the trunks and branches, and prune the trees. This rough bark may do little harm, but it denotes lack of thrift, and affords a harbour for injurious insects. The pruning was simple in this case; only dead branches and crowding suckers were removed.

How much to prune in other cases will depend upon the condition of the trees. If they are old and decrepit, with dying branches and failing strength, pruning should be vigorous. An apple tree can be renewed like a grape vine. A wealth of runaway shoots is its signal that such renewal is needed. In extreme cases a tree may even be cut to the ground, and another built upon a young shoot which springs up. This is seldom demanded, but with old trees which have lost their vigour, whose branches are diseased, and which have made but little growth, quicker returns and better fruit may come from heroic treatment. Cut out the old branches ruthlessly. Leave vigorous young suckers to take their place. A new top will quickly form, and better fruit will result. If trees are not so far on the decline such pruning will not be needed. It may then be confined to thinning out useless branches. Sunshine and air should have free access.

Apple trees and their fruit contain plant food. The tree must be fed to produce good fruit. Some soils are rich enough to produce crops year after year without manure, but most soils are not so well provided in this respect.

To restore the fertility of a wornout orchard the following manurial dressing may be recommended, in quantities per acre: 125lb. nitrate of soda, 100lb. dried blood, 650lb. superphosphate, and 125lb. sulphate of potash.

This makes a total of about half a ton per acre. Much experimental work has been done with fertilisers in the growth of fruit, but there still must be much guesswork in the use of artificial manures for these crops. No one can tell the fruit grower just what his land needs; the soil must give the answer.

An orchard that has been much impoverished needs nitrogen. Its lack of thrift and small amount of growth proves this fact. In well-managed orchards, with soil of ordinary fertility, nitrogen can be supplied by sowing down to red clover or some other leguminous crop. Nitrogen can be supplied in the same way in a neglected orchard when once under way. In the beginning of the improvement farmyard manure, with a little nitrate of soda, will help to get the growth desired.

The second step is to plough the orchard and till the ground. Tillage acts as manure; it will help the nitrogen to bring about plant growth. If we wish to grow apples we cannot afford to have the trees battling with weeds or with grass. The trees need the moisture, and all the food they can get; weeds and grass will rob them of it. Thus a grass-covered orchard loses its moisture and its food, and so becomes impoverished of the very elements that tend to fruitfulness.

Tillage should continue frequently during early summer. By midsummer wood growth should cease; tillage should then stop. A clover crop sown at this period will protect the soil from washing by heavy rains, and will add humus to the land. The clover crop will gather nitrogen from the atmosphere for next year's growth.

All good rules have some exceptions. The best way may not be the best in all cases; sometimes it may not be advisable to plough the orchard, it may be on a hillside which is too steep, or something else may prevent.

Two alternatives are open which will yet permit abundant fruit. The orchard may be pastured with sheep or pigs. Pigs will plough it, sheep will not. In either case more animals should be kept than the grass in the orchard will support. Grain or some other concentrated food should be fed to supplement the grass; this brings fertility to the orchard soil, it also insures that the grass shall not grow tall. Grass will evaporate less water if kept short.

The other alternative is to let the grass grow, then mow it, and let it lie about the trees; this system seems to contradict the idea of growth upon which the system of tillage is founded, but it has a few advocates who show excellent results. It ensures a winter's mulch, and adds humus to the soil, but draws heavily upon the soil moisture during early summer. It is, therefore, not strange that its advocates thus far seem to be those who are dealing with a wet soil or a rainy climate.

BED OF MDME. CROUSSE IVY-LEAVED PELARGONIUMS AT HAMPTON COURT.

Protecting Tulips in Bloom.

The stems of bedding tulips are so easily broken that even a more than usually rough wind will snap them off. But this is nothing compared to the damage the domestic cat and dog will do in breaking the stems and injuring the plants in various ways. It will generally be found that these pets have a particular corner of a bed which they patronise, and I have been at times greatly troubled by their attentions. Of course, a stout boot is always handy and useful, but then, walls have windows, and the pets I refer to are those of the household. I have found that a simple way of keeping them at bay is to bend a piece or two of wire in the form of an arch, and insert this near the favoured spot.—E. J. K.

THE VIOLET.

The violet has a charm all its own. It appeals in greater or less degree to each one of us. We loved it when we were children, and the love has grown and strengthened with our later years from whatever standpoint we take it, and I purpose dealing with it in all its aspects. We shall, I think, find delight and refreshment in the study of it.

It has its poetic as well as its practical side. It is essentially a spring flower in its wild state, though when cultivated it is with us the greater part of the year, cheering our dull November days and smiling through March, April, and May.

Shall we take its culture first? and treat of its varieties, its native habitats, etc., and then turn to its poetic side, leaving that till last.

It is a great mistake to plant sweet violets in out of the way corners of the garden. Frequently they are seen under trees or in other shaded positions, when they produce splendid foliage but few flowers. There are various methods of growing them successfully which I shall briefly refer to. In every case good culture in an open situation is essential. In no other way can the crown be well ripened and a plentiful supply of flowers depended upon. Strong, short-jointed, healthy runners should be procured and planted out in April in lines in fine, rich, loamy soil about a foot apart. If runners are scarce, healthy clumps may be pulled in pieces and planted. Not much appearance of growth will be apparent for some time after planting, but root-action will be going on. Keep the beds clear of weeds, and move the surface occasionally with a Dutch hoe, recalling the proverb: "If you scratch with a harrow it smiles with a harvest." I would strongly advise summer treatment, the same as for pansies, a top-dressing of rich compost or old rotten manure and leaf soil in June, and a dusting of soot between the rows. The plants ought to be freely watered and dusted with sulphur if red-spider or mildew puts in an appearance.

In September—this is one of the methods—lift the plants carefully with large balls of soil and plant in a cold frame facing south, keeping the plants near the glass and so close to each other as to allow the tips of the leaves of one plant just to touch those of its neighbour. The frame ought to be made up with open sandy soil of some depth. Sometimes the soil is made to rest on a thick layer of leaves, but this is not necessary. When moving the plants into the frames, all withered and decaying foliage should be removed, and if the weather at the time be mild and dry the sashes ought not to be put on for some days. Even after it is deemed advisable to put on the sashes plenty of air must be given, night and day, except when freezing, then the sashes require to be closed and covered with mats if the weather be very severe. If the plants become dry they must be watered in the morning, giving plenty of water between the rows, and in fine weather, even in the depth of winter, a slight syringing occasionally overhead is beneficial. If this method of culture is carefully followed out sweet violets can be had in bloom continuously from October to March.

Sometimes the plants instead of being lifted in September are framed round where they stand, and the most excellent results can be had in this way. In the milder districts of the country it is possible to obtain a very continuous supply of flowers from plants grown entirely in the open ground, in which case it is not of course necessary to make a new plantation every year, but it is advisable to have young plants constantly coming on, and every year discard the older plants just in a similar way as is done with strawberries. Seed can be easily saved from the single-flowered varieties, and it ought to be sown in lines in a cold frame, or in the open-air, and the plants pricked off or transplanted when large enough to handle, and later placed where they are to bloom.

In March or April the plants in frames should be examined, and all unhealthy leaves removed and a quantity of fine soil mixed with sand and spread over the surface to the depth of an inch or more for the purpose of helping the runners to root.

Violets, like all other flowers, should be gathered in the morning and immediately placed in water. A sufficient supply of leaves should be taken at the same time. If the flowers are to travel by post or rail they should be allowed to stand in water for a few hours, and if gathered from outside in wet weather they must be allowed to dry before being packed. Pack with their own or other leaves and tissue paper slightly moistened. If moss or damp cotton wool is used it should not be allowed to touch the flowers. Always place a piece of soft paper between them. Use small boxes and pack tightly.

The following lists embrace most of the best varieties in cultivation:

Singles.

Admiral Avellon, reddish-purple, vigorous, deep green foliage; California, violet-purple; Devoniensis, deep blue; Odoratissima, blue-violet, highly fragrant; Princess Beatrice, bright blue, vigorous habit; Princess of Wales, rich violet-blue, large and fragrant, long stalk, and strong habit; Rawson's White tinged with pink, dwarf habit; Single Red, an old well-known sort; The Czar, dark purple, exquisite perfume; Victoria Regina, rich violet-blue, bold habit, early; Wellsiana, deep purple, large, long stems, deliciously perfumed; White Czar, snow white, strong growth, and free bloomer.

Doubles.

Belle de Chatenay, pure white, large, and fragrant; Comte de Brazza; Swanley White (Syn.), snow-white, fragrant and free; De Parma, pale lavender-purple, useful for frame culture; Double Red, an old-fashioned useful sort; King of Violets, dark indigo-blue, best out of doors; Lady Hume Campbell, rich blue, fine late variety; Marie Louise, lavender-blue and white, fine winter blooms; Mdlle. Bertha Barrow, beautiful indigo blue, strongly perfumed, very free; Neapolitan, lavender with white eye, a winter-flowering sort; New York, mauve, very fragrant and fine; Parmaensis, white rose striped, a pleasing sort; Queen of Violets, white, tinted violet-rose, large and fragrant; Swanley White (Syn), Comte de Brazza.

H. C. Philbrick.

(To be continued).

Annual Larkspurs.—If a good strain of annual larkspurs is obtained there is no spot in the garden too choice for it. The flowers are extremely light and elegant, the foliage is finely cut and delicate, and the colours of many varieties are charming. If not found a place elsewhere, a good patch should be sown in the kitchen garden for giving cut flowers. The long, dainty spikes are particularly suitable for vase filling, and if cut young, last quite a long time. For very large trumpet vases I have frequently used whole plants, cutting them off near to the soil and splitting the stems before placing them in water. Seed can be sown at any time now, on a sunny border of light and sandy soil. —E. J. K.

SPINACH.

In private establishments there generally is a demand for spinach, more o less, throughout the year. It is not very fastidious as to soil, but to avoid failur as fas as possible, it is best to take precaution when preparing to see that it is well sweetened by exposure to frost by digging early. At this time, in most cases, a light application of lime and soot will assist the crop and act as a deterrent to insect life.

For the earliest sowing a high and warm border is necessary; if it has been dug as recommended, and a dry day is chosen, the usual raking will provide a proper seed bed. The drills should be drawn out a from fifteen to eighteen inches apart, and two inches deep. Sow the seeds thinly and evenly, and return the soil to the drills, leaving a level surface for the youn plants to push their way through. I the weather is genial germination quickly takes place, and as soon as the plants have their rough leaves formed, promptly thin them to about ten inches apart, to allow full development of their leaves, except in a case of scarcity, when a few rows may be left thickly to cut off wholesale until the remaining rows are ready for gathering from. With favourable weather spinach is naturally a fast-growing plant. but much can be done to forward the plants by administering light applications of nitrate of soda or sulphate of ammonia at short intervals during moist dewy mornings, or damp days, and keeping the crust of the soil stirred with the hoe. I is generally considered that the prickly variety is the best for the early and la sowings, and possibly so, but I have sown and been rewarded with good returns from the round-seeded kinds for an early crop.

For the series of sowings through April and May an open part of the garden is the best. Where judicious mixed cropping can be carried out, to make the mos of space, it is much to be recommended but spinach, as it is sometimes seen, sown thickly amongst too closely placed rows of peas, should be avoided. A much more profitable crop can be secured from the t of celery trenches, or other sites wher undue shade does not exist. A sowin in alternate weeks through the above two months, in size according to likely demands, will be advisable. The variety Monstrous Viroflay, does well, and gives fleshy leaves at this time of year whe thorough cultivation is given.

As previously mentioned, spinach makes rapid growth during hot weather, and t guard against scarcity through the plants running to seed it is an excellent plan, through June and July, to devo a north border to this crop. The plants here lay cool, their growth is more steady and they are not so liable to bolt, consequently they carry on safely over a longer time, but even here it is not prudent to sow at too long intervals, but it is reasonable to expect the sowing made at the end of July will yield a supply well into the autumn months. If economy of space in the garden has to be closely considered every other row may be gathered, removed, and the site planted with tall kales, etc., which, with their erect growth, will afford protection to the remaining rows during late autumn and early win

The final sowings are important ones as they provide the winter pickings. The exact date to sow is difficult advise, as the part of the country and position of the garden each have th effect upon the plants, but two sowings at least should be made from the begi ning to the middle of August to enable the plants to become firmly established before cold nights and frosts arrive. A south border that has been occupied by early peas or potatoes will possibly be vacant, and will provide a good friable seed bed for these sowings; if dug over, with a coating of manure mixed in, and a dressing of soot to the surface, it will suffice. The prickly varieties are to be recommended for this season; allow fifteen inches between the rows, and, as with the earlier crops, attend to the timely thinning of the plants, and, if necessary, give applications of artificial manure as advised. Do not permit the gathering of the leaves of these plants until the other crops are over and it becomes necessary, but in every way possible foster their strength for the winter.

Perpetual spinach is sometimes called the gardener's friend, and often it allays anxiety when there is a shortage of true spinach. If a sowing is made now, and another in June, in any ordinary soil, the first will carry over the summer, and the second will yield through the winter. Although it cannot be reckoned as first class, it is an excellent substitute for spinach, and I have not received complaints when sending it in for use, while a sense of security is enjoyed by having it growing as a supplement to the other spinach.

Charles Flack.

THE RUMPENHEIM LILAC.

For very many years there grew in the gardens of Cambridge Cottage at Kew (the residence of the two last Dukes of Cambridge) a pair of lilacs of somewhat unusual character. They have each formed a clean single trunk, and have never produced sucker growths from the roots as lilacs mostly do. The trunk of the larger one is 4 feet 2 inches high, and 2 feet in girth, and the flaky bark has the spiral arrangement, frequently seen in lilacs very markedly shown. These plants are Syringa vulgaris, but the tree-like character is not common in this country. It may possibly be due to their having been raised from seed, and not from cuttings as is usually the case.

Besides their unusual appearance, these lilacs, says the "Kew Bulletin," have a certain historical interest. They had both been brought from Rumpenheim-on-the-Main, near Frankfort, a favourite palace of the Hesse family. This place is frequently mentioned in Sheppard's "Private Life of the Duke of Cambridge," from which work we learn that it was bequeathed by the Landgrave Frederick of Hesse to his children jointly. He also expressed the wish that they and their children should assemble there every second year. This desire was faithfully fulfilled. As long ago as 1837, when the late Duke was but 17 years of age, he wrote, "I am delighted to be once more at dear old Rumpenheim." He made his accustomed pilgrimage to Rumpenheim for the last time on August 25, 1903.

With the death of the Duke in 1904 Kew ceased to be a place of royal residence, a distinction it had possessed since 1730, when Frederick Prince of Wales and his consort, Augusta, came to live at Kew House. Cambridge Cottage has now been given over by His Majesty the King for public use. These two lilacs have always been objects of peculiar interest to the Royal Family, especially to the descendants of the Landgrave Frederick above mentioned. H.R.H. the Princess of Wales, who is his great granddaughter, expressed a desire that one of them should be transferred to the gardens at Windsor. This was accordingly done in [illegible]. The other and larger one, which was growing in an unfavourable position, was removed on December 23, 1907, to the lawn in front of Kew Palace, a building which has even longer associations with the Royal Family than Cambridge Cottage.

LATE-KEEPING APPLES.

It would, I think, be difficult to give the names of six better and more useful late-keeping apples than those mentioned by your able correspondent, Mr. Coomber (page 178). The varieties he mentions I have been acquainted with for some years, and all have proved excellent. Bramley's Seedling is one of the very best for cropping and keeping: I have this variety as standards on the crab stock in soil that is rather gravelly and porous, yet the fruits produced are heavy and solid, and keep excellently until the middle of March. Newton Wonder I have also growing on the crab, and although the trees are not so old as Bramley's, they fruit well, and the apples are of excellent cooking quality, and of a very pleasing appearance. I believe both these first-rate late apples are from Nottinghamshire.

Lane's Prince Albert is both remarkable for cropping and keeping, and Wellington holds its own in many parts of the country. There are two other apples with which I have been acquainted for many years, and they might well be included among the best keeping varieties, namely, the Gooseberry Apple and Northern Greening (or French Crab), both these, if properly harvested and stored, will keep sound till the following crop is ready. They succeed well as standards, and might well be included amongst orchard varieties where lateness is considered.

My best dessert apples at the present time are Duke of Devonshire, Court Pendu Plat, Lord Burghley, and Scarlet Nonpareil. These I have growing as bushes in the kitchen garden, and I have never known them to fail in cropping. Lord Burghley, I may say, is not so free as the other three.

It would be very interesting if Mr. Coomber would give us the names of a few of the best dessert varieties for keeping in his immediate neighbourhood, the nature and conditions of the soil, also the stock employed for grafting or budding. I rather incline to the belief that the stock is not sufficiently considered for different varieties, and the nature and depth of the soil. Here the soil is light, and it would appear from the growth that the crab stock is the best and most suitable, while probably a variety which is of strong growth grafted on a deep-rooting stock, and planted on good loam of great depth, might fail to produce anything like a reasonable crop unless the roots were severely pruned. The same variety might prove just the reverse if worked on a dwarfing stock. The same may be said with regard to pears; those worked on the pear produce larger fruit than if on the quince and in light and porous soil, and just the reverse where the soil is deep and cold.

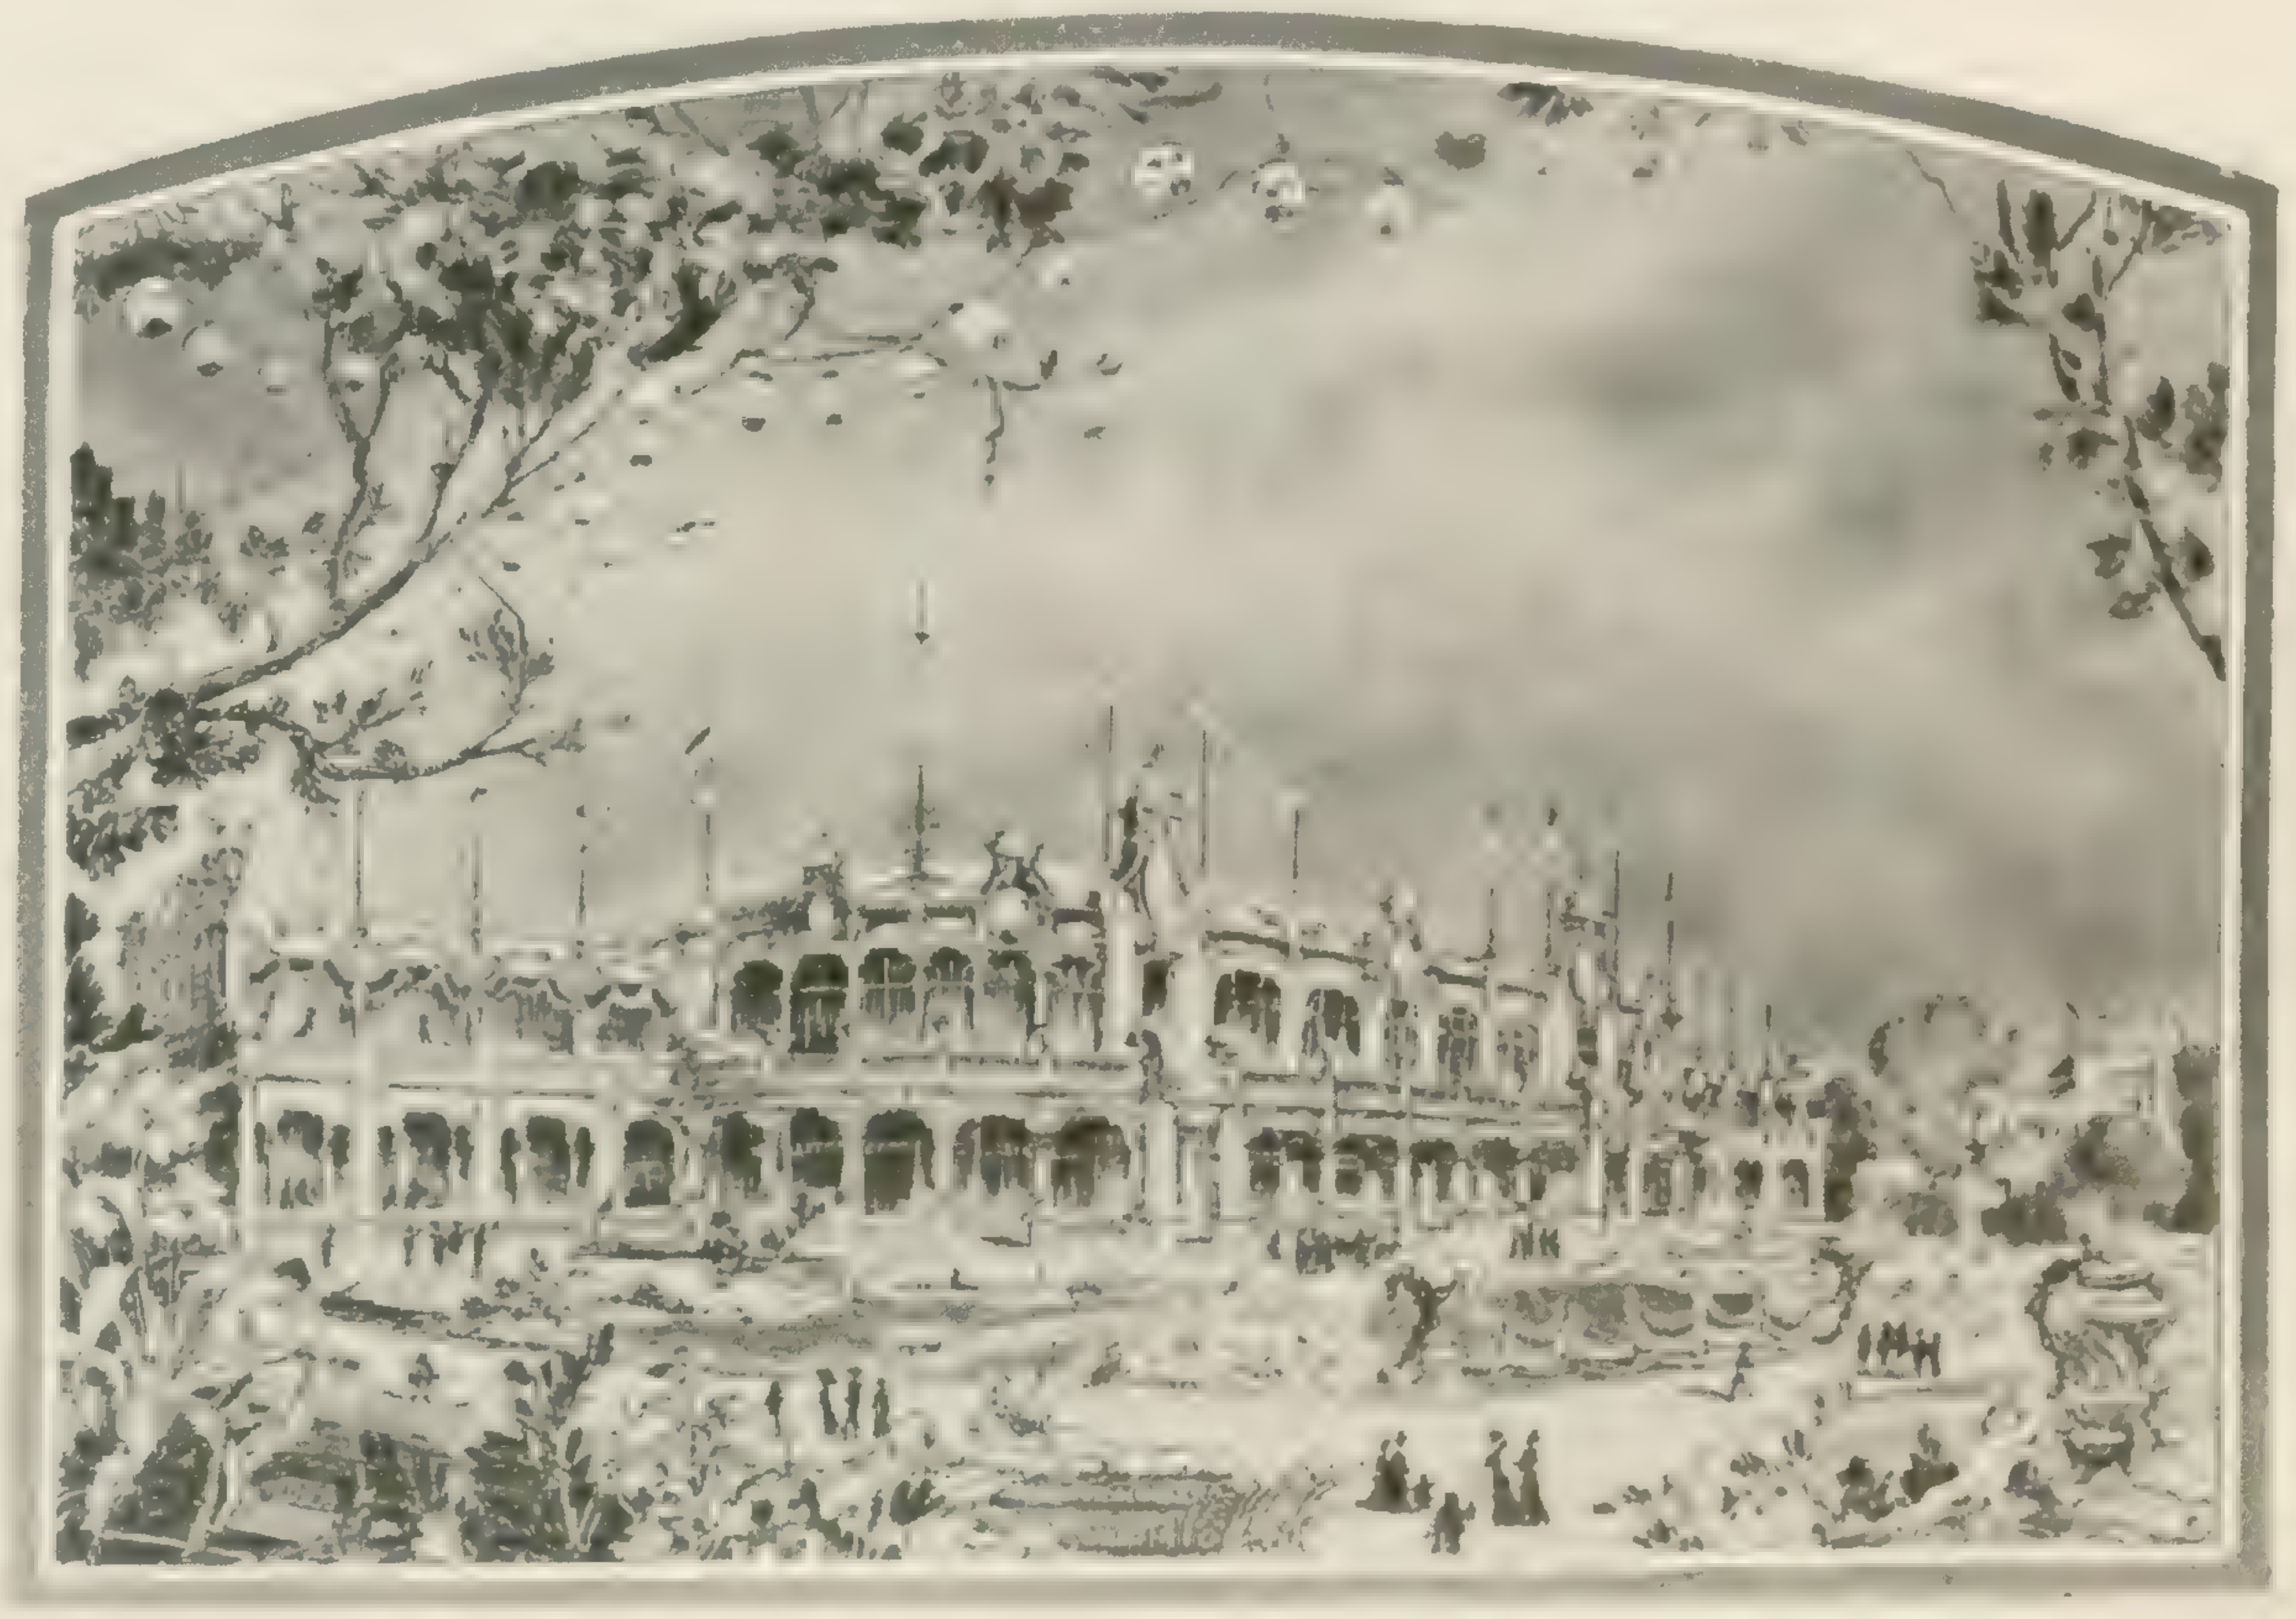
Wrotham Park Gardens.



THE GARDEN CLUB AT THE FRANCO-BRITISH EXHIBITION, SHEPHERD'S BUSH.

GARDEN CLUB, FRANCO-BRITISH EXHIBITION.

In our issue of February 29 we gave a somewhat full account of the progress that is being made at the Franco-British Exhibition at Shepherd's Bush, and referred at some length to the more important of the arboricultural and horticultural features. We also mentioned that one of the most attractive and useful of the many handsome buildings that are rapidly approaching completion is that in which the Garden Club will be located. We have now the pleasure of giving an illustration of the structure, and from this it will be readily seen that it is handsome in design and noble in its proportions. We would add to what was said in the issue of the date mentioned, that the club has a frontage of 300 feet and a depth of nearly 150 feet, and, as might have been expected, is being equipped in accordance with the most advanced ideas regarding club life. Both ladies and gentlemen will be eligible for membership, and the club will be under the direction of a committee, of which the Earl of Jersey is the president.

"CHRYSANTHEMUMS AND HOW TO GROW THEM FOR EXHIBITION," by J. B. Wroe.—Full details on timing and stopping for Northern, Southern, and Midland growers, selections of the best varieties, illustrated instructions on taking the buds, cuttings, staging, etc. Prices 1s. net, by post 1s. 2d., cloth, 1s. 6d., by post, 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

HARDY FERNS IN SPRING.

Most of the species of native hardy ferns are commencing in March to show signs of growth, the curled-up fronds of the crown-forming section swelling and loosening, while the growing tips of those with creeping rootstocks will have begun to extend and show vitality. At this stage, when the deciduous ferns are mere frondless stumps or clumps, and the fronds of the evergreens have evidently done their duty and will soon be replaced by new ones, it is clear that shifting, dividing, or handling generally can be effected with a minimum of damage. All, indeed, that is needed is to remember that the coming season's growth is neatly packed up in the crowns, and that therefore these must not be squeezed or damaged. All really dead fronds may be removed, but still green ones should be left, as their removal while still alive involves a certain check upon growth, and should be avoided.

In the open it is not advisable to clear away the old debris unless the crowns be subsequently sheltered from drying winds by a liberal mulching of leaves. New growth is always accompanied by the emission of new roots from the bases of the coming fronds, and in old plants these roots travel for several inches before they reach the soil. This, in their natural habitats, occurs beneath the mass of dead fronds which envelop the crown, and are usually saturated with moisture, and it is obvious that if in our desire for neatness we remove this protection and droughty March winds set in, these new roots are apt to be damaged.

Old ferns are apt to raise their crowns considerably above the ground, and when this occurs under ordinary garden conditions growth is apt to be checked, the new roots having to travel farther with greater risk of damage. This can be remedied by lifting the fern bodily and replanting it in a deeper hole, bringing the crown or crowns again to the level of the soil. Opportunity should be taken of operations of this kind to divide up such old ferns as have formed crowded masses of crowns. If growth be confined to a single crown of such ferns as Male and other Buckler Ferns, Lady Fern, and Shield Ferns, the fronds will be much more finely developed, and if the fern be one of those beautiful varieties which we advise should be grown in lieu of the common weed forms, the character will be greatly enhanced. These clumps are gradually formed by the growth of lateral buds or offsets, which compete with the central or parental one for root room below and air space above, to mutual detriment. As these develop each one forms its own bunch of roots, and becomes almost independent, only a small attachment to the main rootstock persisting. They can consequently, as a rule, be easily pulled away, and if care be taken to liberate the roots as well they will establish themselves right away when planted.

Where choice Shield Ferns (polystichums) are concerned, it often happens with many varieties of the divided forms that bulbils appear near the bases of the fronds, or even, in the "proliferum" section, all along the midribs. These are very handy for propagative purposes, as if layered with a short piece of the midrib attached they will soon root. In clearing away the old fronds of this species it is, therefore, well to keep an eye open for such bulbils, as they yield presentable plants more quickly than spores.

For the reasons given above March is a good month for overhauling pot plants, repotting and dividing, but our remarks as to division do not, of course, apply to specimen plants of the Polypodiums, Bladder Ferns, or Spleenworts, as none of these tend to depreciate in the same way as the crown formers, and are seen at their best when their creeping roots or bunches of crownlets have formed a pretty group. Under glass ferns in pots are very apt to suffer from neglect of watering, in which case the pot should be immersed in water for at least an hour to ensure a thorough soaking, otherwise the water simply runs away as fast as supplied, and no good is done at all. Ferns like a good open leafy soil, and the best compost is one part yellow or good loam, one part leaf-mould, and a liberal dusting of coarse sand. This is needed for pot culture, but out of doors good ordinary garden soil does, as a rule, very well.

Chas. T. Druery, V.M.H., F.L.S.

FUMIGATION WITH HYDROCYANIC ACID GAS.

During the past few years the method of destroying various insect pests by means of fumigating with hydrocyanic acid gas has been much advocated, and the recommendation has been made in a leaflet from the Board of Agriculture and Fisheries. For the destruction of mussel scale, woolly aphis, mealy bug, thrips, weevils, and red spider in greenhouses, etc., the method is very valuable, while it may also be employed for the fumigation of poultry houses in case of infestation by lice and mites.

Nursery stock fumigated with hydrocyanic acid gas before planting will be freed from insect enemies in all stages save that of the egg.

Materials to be Used.

The materials necessary for purposes of fumigation are:—(1) Potassium cyanide of 98 per cent. purity; (2) sulphuric acid of a specific gravity of not less than 1.83; (3) water; (4) jars and a glass measure.

The following quantities may be taken as a standard for use:—Potassium cyanide 1 part, sulphuric acid 1½ parts, and water 3¾ parts.

The proportions of cyanide, sulphuric acid, and water to be used, and the amount of space per unit of cyanide, vary slightly as recommended by different authorities, three different workers recommending one ounce of cyanide of 98 per cent. purity to every 200 or 300, or 500 cubit feet of space respectively.

The variation in the amount of cyanide depends to some extent on the character of the plants that are being treated, on their strength, whether they are dormant or active, evergreen, or deciduous, and also on the season. In the case of tender plants, one ounce of cyanide may serve for 500 cubic feet of space, while hardy plants may be treated with one ounce of cyanide to 200 cubic feet of space.

Treatment of Greenhouses, Conservatories, Nursery Stock, etc.

The glass-house or other place which is to be treated must be rendered as airtight as possible.

The sulphuric acid should be poured very carefully and slowly into the water, which may be put in an earthenware vessel, e.g. a large jam-jar. The cyanide of potassium, wrapped in thin blotting paper, should then be dropped into the now diluted sulphuric acid. The vessel into which the cyanide is dropped must be so near the door that it can be reached by the outstretched arm of the operator, who should immediately shut the door and close up its chinks by paper previously prepared. Another, and better method is for the operator to introduce the cyanide to the diluted sulphuric acid through a window, the cyanide being placed at the end of a long stick or rod, or be lowered into the acid by a string and pulley. The window must be closed immediately after the addition of the cyanide, so that the operator may escape the fumes. Strawson recommends the pouring of the diluted acid from a bottle fitted with a cork in which two slits are cut, one to let in air and the other to allow a small and even stream to flow upon the cyanide, the object being to provide a slow and even disengagement of gas. The bottle should be arranged so that it can be tilted up when all is ready.

It is of importance also that the hydrocyanic acid gas fumes be distributed over the house, and this may be done by an arrangement of fans which can be worked from the outside.

Fumigation should take place in the evening, or after nightfall, and not in strong sunlight. The temperature of the house should be from 50 degs. F. to 60 degs. F. The plants to be treated should be dry. The surface of the soil of the house should also be as dry as practicable. Experiment has shown that the eggs of the Woolly Aphis may remain unaffected, and therefore fumigation should be repeated in ten days. Eggs of the Apple Mussel Scale are also unaffected by gas of the strength mentioned.

The work should be done by a careful and skilled operator, for the cyanide and its fumes are very poisonous and dangerous to human and animal life.

The treated room or conservatory must be kept closed during fumigation from three-quarters of an hour to an hour, after which the room should be ventilated, the windows, etc., being opened from the outside, and no one should enter until an hour has elapsed. While opening the windows, etc., the operator should be careful not to inhale the escaping fumes.

It is safer not to fumigate when the plants are in bloom.

In the treatment of nursery stock the bushes or young trees should be placed in an airtight box or canvas tent of known capacity and subjected to the fumes of hydrocyanic acid gas for one hour. Large numbers can be treated at once at little expense.

When the time has expired the tent or box should be opened in such a way that the wind blows the fumes away from the operator, and should be left to ventilate for half an hour before the stock is removed.

Trees in the orchard may also be treated by the use of a canvas tent or cover.

Canvas Covers for Fumigating.

The practice of using canvas covers for fumigating is not so common in Great Britain as in some other countries, and the method followed in the colonies may here be given for the guidance of those who wish to undertake orchard fumigation with hydrocyanic acid gas. According to Claude Fuller, the Natal Government entomologist, the covers should be of a light, durable material, and comparatively gas-tight, the most suitable probably being canvas. Eight-ounce American duck canvas is recommended.

There are three types of covers: Sheets, tents, and box covers. The sheets are octagonal in form, and can be further enlarged by sewing on a "skirt" round the edge. These can be easily lifted over small trees up to six or seven feet in height, above which a hoisting apparatus must be used. Tent covers may be used for trees up to 13 feet in height. They take the form of dome-shaped tents, the mouth of which is kept open by a ring of gas piping passed through canvas loops, and they can be quickly lifted over and removed from 8 to 13 feet trees by a couple of men, where the hoisting of a sheet would take three or four. Box covers are made to any convenient size by covering a wooden framework with canvas or calico; the latter material should be painted or oiled to make it sufficiently gas-tight.

Caution.

As both the potassium cyanide and the hydrocyanic acid gas are deadly poisons, the former should be kept in a tightly stoppered bottle and labelled "Poison," whilst the gas as generated must on no account be breathed. Fumigation should not be carried out in a high wind, nor when the trees are wet, but otherwise it may be done at any season of the year.

GARDENING AND GARDENERS.

In his criticism of my "hot and cold effusion" Mr. J. Weathers says (page 137), "Your correspondent evidently thinks the gardener ought still to continue to allow himself to be injured by unscrupulous people." I think nothing of the kind. Nor did I say that "the gardener was selfish or foolish who endeavoured to protect himself and to obtain a fair remuneration, etc." What I maintain is that it is both selfish and foolish to be ever anxious to keep others from earning as good a living as they can, and improving their position as best they are able. When Mr. Weathers gives his definition of "labourers, interlopers, and outsiders," it is very evident that he and I are thinking of two totally different classes of men. I am not upholding men who have "never spent an hour in learning gardening," nor the "man who pretended to be a gardener when he knew he was not." I do not believe a thoroughly good gardener is at all afraid of that class of men, nor do I think they have the power to injure a really qualified man.

The men I seek to defend are those who, though illiterate, and consequently unfitted for technical examinations or tests arranged by a committee, commenced either as lads, or later in life to work in gardens as labourers, and who, by dint of perseverence and unceasing effort, have gained sufficient knowledge and practical experience of the ordinary routine of gardening to enable them to take perhaps a single-handed place, or a decent position in a nursery or large private establishment. I have had a good many such men working with me, and under me in my time, and although some of them, if put to the test of an examination, would surely fail, and therefore be classed as "unqualified," they have been well able to discharge the duties devolving upon them to the entire satisfaction of all concerned. I say, therefore, we have no right to endeavour to oust these men from the profession.

By all means let the man of higher qualifications take precedence. Let the best men make the best of their abilities, and let the "B.G.A." help them to do so. It is, however, worthy of note that it is not from the best men, or those who have climbed high, that these bewailings and complaints arise. It is those who are but little, if any, better qualified than those whom they denounce, that are ever advocating what I have called "barricading schemes."

Mr. Weathers tells us what we have often heard before with regard to the purpose for which the "B.G.A." was established. He further states that "the only chance for the professional is to join the 'B.G.A.'" May I ask him to give just a little more information? Will Mr. Weathers kindly tell the readers of the Gardeners' Magazine what the "B.G.A." has thus far accomplished? I do not mean how many members it has enrolled, but what has it done for its members?

I know full well that the society is as yet too young to have accomplished great things, but I feel sure a statement of what has been accomplished up to date towards raising the status of the gardener will enable readers to decide whether, as Mr. Weathers says, the only chance for the professional is to join the "B.G.A." A Gardener.

The views expressed by those who have written on this subject tend to show that much difference of opinion exists regarding the all-important question of gardeners and gardening. I hope that for some considerable time you will give as much space as possible to the discussion, because it is undoubtedly one of the most interesting topics that has been broached in the gardening Press for a long time past, and one which many who have hitherto disregarded should pay close attention to. Especially is this attention necessary at the present time, for I imagine there is a growing tendency to check the aspirations of the garden labourer who endeavours to raise himself above his present unsatisfactory station.

The question arises, How can we improve the existing state of affairs? I maintain that education will be a more effectual remedy than the useless feeling of discontent, and the peculiar ideas that many have the propensity to foster and disseminate. It is mainly by education that a man can be made a better workman or a workman a better man. The development of societies which make their main objects the betterment of the classes by union—whether trust or trade union—will not encourage the self-reliance which, combined with self-denial, appeals to me as being essential attributes in all good characters.

Whatever is done for some takes from them the stimulus to work for themselves, and it is the individual effort, blended with a sense of duty to others, that will gradually bring about an improvement. Anything that has a tendency to undermine unselfish individuality should, in my opinion, be avoided, and, unfortunately, this danger is not only apparent in such bodies as the British Gardeners' Association, but is real. Individuals may be appeased, but how can unions; there is always an aggressive faction which have no regard for tolerance.

Your correspondent who advocates supporting mutual improvement societies advances my opinion. I think they are excellent, and a means whereby we may understand each other better. Frank discussions and criticism should be invited, and the papers read should not be confined so much to gardening, but embrace such subjects as industry, character, recreation, etc., for all such topics have a marked effect on those who study and wish to cultivate good fellowship, and discussion on these will enlighten us on many points, and perhaps convince us that whatever position we are in, whether employer, gardener, or labourer, in authority or subordinate to it; and however necessary social distinctions may be, moral distinctions should be non-existent.

I hope others may consider the occasion demands more discussion on this subject. I am sure there are many like myself who wish to improve the state of affairs generally, and I hope I may have the pleasure of knowing that my views may be accepted by many readers of the Gardeners' Magazine. F. W.

Acokanthera spectabilis.—This is occasionally met with in gardens under the name of Toxicophlæa spectabilis, but it is not at all common. The delicious fragrance of its blossoms, and the season of the year at which they are produced, have obtained for it the popular name of the Winter Sweet, but that title is also used for the delightful Chinese shrub, Chimonanthus fragrans, whose sweet-smelling flowers form such a notable feature on a bright winter's day. To have it at its best the chimonanthus needs to be trained to a south wall, as not only does this ensure thorough ripening of the wood, but it also serves to protect the midwinter blossoms. On the other hand, the acokanthera requires the temperature of an intermediate house, while it will also do well in the stove. It forms a somewhat loose-growing shrub, and as a pot plant is not, as a rule, very shapely, but it also does well trained to the roof, and this is perhaps the best way to treat it. The leaves are oval in shape, from four inches to five inches long, bright green, and somewhat leathery in texture. The flowers, borne in dense clusters from the axils of the leaves, are individually small and white, but as each cluster contains a large number of blossoms, a plant when at its best makes a goodly show. Added to this, their delicious perfume soon makes their presence manifest even in a large structure. This acokanthera is a native of South Africa, from whence it was introduced in 1872.—W. T.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

MEXICAN LÆLIAS. — As the flowering season is now over the various species and natural hybrids of this section will be commencing to rest. I have on many previous occasions pointed out in this column, that the success or failure in the matter of flowering the following season depends largely upon the proper resting of the plants. Where a house is provided for the cultivation of this section of lælias there is very little difficulty in providing the conditions suitable; while the plants are in a dormant state the bright rays of the sun and ample ventilation are absolutely essential to enable the pseudo-bulbs to become properly ripened. Where ample ventilation is provided no shading will be necessary, and sufficient moisture to keep the pseudo-bulbs and foliage plump is all that is necessary.

L. ANCEPS.—Where this has to be grown in the same house with other plants, a portion of the house should be set apart for them, where less shading and drier conditions may be given. Every endeavour should be made to retard growth. It is the plants (even in the typical, coloured forms) that start into growth early, that fail to produce satisfactory flowers. A cool, airy greenhouse or intermediate house, where ample ventilation can be given when the outside conditions are favourable, meets their requirements during the dormant season. The various forms of L. anceps should be extensively grown where there is a demand for cut flowers during the months of December and January, as for decorative purposes there is nothing more serviceable to be had at that season, and as plants are plentiful a supply may be procured at a reasonable outlay. I might point out that it is practically useless to attempt to grow L. anceps in the neighbourhood of London and other large towns and smoky districts, where the fogs are bad in winter, as the least sign of fog generally carries off all buds and flowers.

REPOTTING.—I would not advocate disturbing large specimens of L. anceps more often than is absolutely necessary. The plants frequently are found to do well in an apparently starved and crowded out state in a pan or basket, but when disturbed for repotting they take a very long time to become properly established. I prefer to repot when the plants start into new growth, but at the present time I would advise an examination to ascertain the condition of the compost, and those plants which are to be repotted should have the rhizome severed between the second and third pseudo-bulbs, where possible. This will induce the back eyes to plump up, and, although such growths may be late in starting, they frequently produce flowers, in the white section, where the newly-potted leading growths fail. Where it is desired to repot at the present season, when the new roots are in an active state, the plants should be subjected to the conditions of the cattleya house, where every encouragement may be given to enable the plants to become re-established. I prefer growing the plants in teak baskets, allow ample space, so that the plants may have room for two or three years. Provide plenty of clean drainage, and use a compost of about equal portions of fibrous peat and chopped sphagnum moss.

COCKROACHES AND WOODLICE are very troublesome, as they eat the new roots of these lælias. Some hollowed-out potatoes form good traps, while Chase's beetle poison placed about the baskets and stages will help to keep the pests in check.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

THE CONSERVATORY should now be in its brightest possible condition; in fact, I have often noted that towards the end of March, in favourable seasons, there is a preponderance of flowering plants. What with bulbs in general, forced plants of various kinds, and plants flowering in a natural manner, it is comparatively easy just now to have a surplus of good things. When such is the case a special point should be made of retarding the latest of any given kind as much as possible, consistent with safety. A cold frame will now be quite safe for late bulbs, and if this can be given a north aspect it will be all the better. All spring bulbs come on with a rush after a few sunny days, whilst at the same time, if precautions in shading be not taken, those now in full bloom will fade all too soon. With a surplus of good things just now there may be a tendency towards overcrowding, and this is a decided mistake, for it is thus possible to detract from the individual merits of the plants. For a time, if possible, some plants should be transferred to a more suitable house to become re-established. Small ferns, grevilleas, aspidistras, Ficus elastica, and such-like plants come under this category, so do the cool house palms. Fire heat can now be dispensed with under the average of conditions, and so long as 40 deg. at night can be maintained it is better not to use it, whilst if a little air can be admitted during the night it will be beneficial.

GLOXINIAS.—These become more popular every year, and no wonder when we consider the extreme loveliness of the flowers of many of the choicer strains; the end of March is a good time to sow the seeds, which must be done with great care, similarly, in fact, to calceolaria seeds, merely covering them with silver sand, and placing them in a shady position in a stove or cucumber house. A square of glass placed over the pan or pot containing the seeds, this being covered with moss, will reduce the need for water until the seeds germinate. The young seedlings must not be exposed to hot sun, especially when the foliage is wet, or they will soon be ruined. Young gloxinias delight in plenty of heat and moisture. If moisture is lacking, they soon become infested with thrips—their chief enemy. Some growers are opposed to syringing the foliage of gloxinias, but I have never found any harm from the practice if it is discontinued as soon as the plants come into bloom. Both the erect and drooping strains have their special beauty, but the former are more in favour. The spotted varieties are also charming.

HYDRANGEA HORTENSIA VARIEGATA.—This is one of the most useful ornamental-foliaged plants for a greenhouse in early spring, especially where there is a little artificial warmth. The young growths take on a delightful variegation, and it is from these shoots cuttings should now be made. It taken off when three inches or four inches long they strike readily in a gentle bottom heat, and quickly grow into size. To have the variegation as perfect as possible, light and sun as well as warmth are necessary.

HARRISON'S GIANT MUSK.—This plant is a great favourite, especially in pots. In some instances I have seen it growing very luxuriantly. This cannot be raised from seed, at least, I have never known it to mature seed. Old plants that have been kept through the winter should now be placed in warmth, and they will soon start into growth, and cuttings will root freely in any position where they can be kept from sun and air. If the young plants are grown on in warmth they will make growth rapidly. I have known good plants established in about a month from the time the cuttings were potted off.—T. B. Field, Ashwellthorpe Gardens.

THE FLOWER GARDEN.

THE RECENT STORMS will have provided plenty of cleaning up work. Carefully examine all freshly planted and wind shaken plants and trees, and insure them being made firm in the ground. Also see that all are properly staked and secured to prevent repeated loosening in ground,as when this takes place it is quite impossible for anything to root and thrive properly.

HARDY OR BRITISH FERNS should now be attended to. Remove all old dead fronds, and plant, clean, rearrange, etc. Where there is no replanting to be done a good top-dressing of loam and leaf-soil is very helpful; a shady position, though not necessary, is very beneficial if the shade is not too dense. When planting retain as much soil at the roots as possible, but do not bury the crowns deeply.

ROSES.—The last of the protecting material must now be removed from dwarf roses, and pruning may be proceeded with, though if desirable to ensure a late crop of flowers, it may be deferred until early in April, or if in what is known to be a position or locality exposed to late frosts, it is better to postpone pruning. Rose or briar hedges may be attended to and treated according to varieties. Strong growths may be tied in instead of removing them. Never attempt anything in the way of clipping.

GLADIOLI AND GALTONIAS (Hyacinthus candicans) may now be planted. The former should be planted about three inches deep, and galtonias a little deeper. If the soil is at all stiff or heavy a quantity of lighter sandy soil should be placed at the base of each bulb; they may be planted either singly in borders, or used in large beds as dot plants, or breadths of them may be arranged with some of the shorter growing annuals as a ground work for them, when very pleasing combinations may be made.

DAHLIA ROOTS.—Where early flowering dahlias are required the old roots may now be removed from the stores, divided, if necessary, boxed or potted up and placed in a cool light place, where growth may proceed gradually; these will bloom earlier than young plants though the flowers will perhaps not be quite so large. Early in April will be soon enough to start the general batch.

ANNUALS may still be sown under glass if necessary, as well as the general batch outside. Choose a warm, well-sheltered spot, and well prepare the soil. Earlier sowings under glass should be pricked off into boxes or cold frames, where they can be grown on quite sturdily without coddling; endeavour to have everything well hardened off. Portulacca is one of the best and prettiest annuals for sowing on hot gravelly or sandy soil, but April is soon enough to sow this; it transplants badly, and should be sown where it is to flower.

BEDDING PLANTS.—Continue to box up or pot off rooted plants of lobelia, ageratum, iresine, alyssum, fuchsias, and other bedding plants; grow them in a genial temperature until the required size is obtained. If there is still an insufficiency of plants required for bedding a further batch of cuttings may be inserted, and grown as quickly as possible without weakening them.

EARLY FLOWERS.—Pay close attention to all expanding flowers; many of the bulbs will rapidly approach their best condition; see that all flowers needing support are given it, to prevent them breaking or falling on the ground. A surface dressing of cocoanut-fibre on bulb beds is a good preventive of damage from splashing. Note the habits of different varieties, with a view of arranging for next season's planting, both in regard to colour and height. The sweet perfume of the wallflower will now become more and more pronounced; note any defect in the strain or variety.—E. F. Hazelton, Knowsley Gardens, Prescot.

HARDY FRUITS.

FIGS.—In the more favourable parts, where figs are grown, pruning and training may now be proceeded with, as by this time the shoots likely to produce the most fruit are readily ascertainable. Hard pruning should not be practised, but, if growing on walls, some amount is necessary annually to keep them in reasonable shape. The branches should not be too thickly trained, as they require ample room for extension. In cases where space is somewhat limited, and the trees grow too strong to be fruitful, the roots must be pruned at intervals. The best and heaviest crops of figs are usually to be found on trees whose roots are somewhat restricted, or when growing by the side of hard paths or roads, where the roots cannot easily penetrate, and the branches are allowed ample freedom. Be careful not to shorten back the young, promising, fruitful shoots, some of which may be trained over the older branches in a downward direction. In the more unfavourable parts, and where protection has been employed during the winter months, the material should now be gradually removed, and when the shoots have been somewhat exposed for a time pruning may be taken in hand and finished as soon as possible. Those intending to plant fresh trees should by all means avoid a rich soil; good drainage is essential, and a compost of moderately heavy loam, with plenty of old brick mortar, chalk, and a little well-decayed horse manure, the whole of which needs to be well mixed together and made firm before planting. I know of no variety for outside culture equal to Brown Turkey.

PEACHES, NECTARINES, AND APRICOTS. — In some favourable parts of the country good crops of fruits are annually produced without much protection, but in other localities, to be on the safe side, protection in most seasons is absolutely necessary. When the flowers are perfectly dry a few degrees of frost would seem to do no harm; on the other hand, if wet, 5 or 7 deg. is quite sufficient to destroy the greater part of the strongest and best blooms. Those favoured with glass coping experience but little difficulty, and also if blinds are suitably fixed and drawn down nightly and on very cold days, plenty of fruit will set. In Kent, where, under my care, I had about 400 yards run of peaches and nectarines on the open walls, and only in one season in thirteen years was the crop light, the trees were protected with two thicknesses of fish-netting fastened to the top of the walls, and kept at a reasonable distance from the trees by the aid of light poles sunk into the ground three feet away from the bottom, and the tops resting on the top of the walls, each pole being made quite secure. Here, where the climate is certainly less favourable, I always tie a few small Portugal laurel branches at intervals all over the trees, and then hang up two thicknesses of ordinary fish-netting, and, although this entails a little extra work, I am more than satisfied with the results. Apricots are treated in the same way. As the season advances, and the weather becomes warmer we gradually remove the material until it is safe to dispense with it entirely. A very good peach, which ripens just after the Dymond, is the Marquis of Downshire (Royal Ascot). With us this is one of the very best of the late midseason peaches.

ORCHARD TREES. — The time has now arrived when all young newly-planted trees should be finally staked and made quite secure against wind. First give the soil about the roots a good firm tread, and then drive in a good stake (if such was not done at the time of planting), place a soft pad of hay or cloth round the stem to prevent injury to the bark, and finally tie with good stout tar twine. Do not forget to thoroughly examine all kinds of young fruit trees, and should the ties be pinching the bark, renew such without delay, otherwise a great deal of injury may be done. After these have been made good see that the labels are correctly placed. If the system of hanging the labels by wire to the branches is used ample room must be allowed for thickening of the wood. I have seen much harm done to trees when wire ties have been overlooked. In some gardens lead labels are employed, the names being stamped thereon; the label is fastened to a stout stake eighteen inches in length, and then driven firmly into the ground, six inches away from the stem, so that no difficulty is experienced in finding the names in summer-time when the trees are in leaf. Take care that neither rabbits nor hares bark the trees. a strip of wire-netting placed round each stem, allowing ample room for the stem to thicken, answers well, and will last for several seasons.—H. Markham, Wrotham Park Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

St. Patrick's Day was celebrated gaily at the Royal Horticultural Hall, Westminster, where a wonderfully fine and interesting display of flowers and plants was made, and there was a very large attendance of visitors to see the good things provided. Early spring flowers were a great feature, but orchids, forced flowering trees and shrubs, cinerarias, carnations, and cyclamens were also splendid.

FLORAL COMMITTEE.

A bank of well-grown cinerarias was exhibited by Messrs. Sutton and Sons, Reading, and the flowers were all of pink or blue shades; the former showed a great variety of shades, from very pale pink up to deep old rose, while the blue varieties were very bright and clear. At one end of the bank was a small group of the curious cactus cinerarias. The Misses Hopkins, Shepperton-on-Thames, showed a small and bright group of alpines, chiefly anemones, scillas, primulas,and primroses. Some very beautiful carnations,all popular perpetual-flowering varieties, were shown by Mr. W. H. Page, Tangley Nurseries, Hampton, and with these were a few vases of Lilium longiflorum. Mr. H. Burnett, Guernsey, brought over some particularly fine carnations; the flowers of Mrs. Lawson, Marmion, Mrs. Burnett, Britannia, and Enchantress were grand.

A charming display of Primula cashmeriana and P. c. alba, with Daphne Mezereum, Scilla siberica alba, Adonis amurensis fl.-pl., and Cyclamen ibericum was made by Messrs. G. Jackman and Son, Woking, Surrey. Hybrid freesias, chiefly orange-tinted and lilac-coloured varieties, came from Messrs. Sutton and Sons, Reading; these show the interest now being taken in these fragrant flowers. In Messrs. Barr and Sons' group crocuses were a conspicuous feature, and with these were Rhododendron dahuricum, Oriental hellebores, muscaris, spiræas, scillas, forsythias, etc.

A handsome lot of perpetual flowering carnations from Messrs. Hugh Low and Co., Enfield, attracted a great deal of attention, as the flowers were large and bright; with these were Gerbera Jamesoni, about two dozen kinds of acacias, such as A. Drummondi, A. armata, etc., and a collection of Indian azaleas, and daphnes. Rose and pink-coloured cinerarias were extensively shown by Mr. J. Streeter, gardener to Mrs. H. S. Barton, Birtley Gardens, Bramley, Guildford; some of the plants carried very large heads of bloom; some cyclamen flanked the cinerarias. The Misses Kipping, Hutton, Essex, contributed a collection of coloured primroses and other alpines. Forced daffodils and muscaris, Rhododendron præcox, spiræas, Saxifraga Burseriana, primulas in variety, a beautiful pan of Saxifraga Boydi alba, anemones, and hardy heaths came from Mr. Field, gardener to E. Hambro, Esq., Hayes, Kent. Messrs. Jarman and Co., Chard, showed a few cactus-flowered cinerarias.

Forced flowering trees and shrubs were well shown by Messrs. James Veitch and Sons, Chelsea; there were lilacs, azaleas, and rhododendrons, Viburnum opulus sterile, fine wistarias, laburnums, the bright Cydonia Maulei, Cerasus serrulata, standards of Forsythia intermedia, and Staphylea colchica. The fine new Vitis Henryana and Libocedrus macrolepis were also staged by the Chelsea firm. Splendidly-grown cyclamens were staged by Messrs. James Veitch and Sons, these represented a very fine strain as in every case the flowers were of large size and substance, and the colours were clear and rich. The plants were also very freely flowered, and most effective. The same firm had a splendid lot of Primula Kewensis, Streptosolon Jamesoni, Indian azaleas—the latter were mostly of pyramidal shape, and very showy.

Gorgeously coloured bushes and standards of Azalea mollis were shown by Messrs. R. and G. Cuthbert, Southgate, Middlesex, and these were boldly grouped with viburnums, cytisus, lilacs, the deep-hued Magnolia Soulangeana nigra, and Prunus triloba, the whole making up a very fine and effective exhibit. Mr. L. R. Russell, Richmond, put up a very attractive group of Azalea mollis, forced lilacs, wistarias, Prunus triloba, and Clematis indivisa lobata.

A neat rock garden, prettily planted with alpine flowers and shrubs, was submitted by Mr. H. C. Pulham, Elsenham, Essex. Cyclamens were magnificently and extensively shown by the St. George's Nursery Company, Harlington, Middlesex. Alpine shrubs, primulas, saxifragas, etc., were exhibited by Messrs. J. Cheal and Sons, Crawley. Zonal pelargoniums in big bunches were famously displayed by Messrs. Cannell and Sons, Swanley; the pips and trusses, and the grand colours of Lucania, Saxonia, Umbria, Arabic, Hibernia, and Aldenham were splendid. A bolder display of alpines was made by Messrs. T. S. Ware, Lim., Feltham, whose anemones, saxifragas, and primulas were especially attractive; this firm has also a very fine strain of Primula japonica.

Some charming roses were exhibited by Mr. George Mount, Canterbury, who once again showed beautiful flowers of Mrs. J. Laing, Joseph Lowe, Richmond, Frau Karl Druschki; the new Joseph Lowe was well shown, the blooms fine, and on long stems. Messrs. J. Peed and Son, West Norwood, staged a good strain of Primula obconica, some early daffodils, primroses, saxifragas, and other alpines. A fine corner group of forced double peaches—white and rose coloured, and various pyruses, was set up by Messrs. W. Paul and Son, Waltham Cross; the yellow Banksian rose and the rare dwarf yellow Rosa Hugonis also came from Waltham Cross.

A bright exhibit of forced shrubs and early alpine flowers was arranged by Messrs. W. Cutbush and Son, Highgate; magnolias, spiræas, and lilacs were notable features. Miss A. M. Smith, Barnham, Bognor, showed some very good double primroses. From the Guildford Hardy Plant Nursery Company, Guildford, came Pulmonaria saccharata, saxifragas, and hardy heaths. In a second group Messrs. Cutbush and Son had fine batches of hepaticas, Tulipa Kauffmanniana, daffodils, hardy heaths, Rhododendron canadense, Primula rosea, and P. Forbesi.

In the large display made by Messrs. H B. May and Sons, Edmonton, there were batches of the pink Azalea Madame Morrent, fine cyclamens, Clematis Fair Rosamund, C. Lady Londesborough, C. Lord Wolseley, C. Miss Bateman, C. Mrs. Quilter, Primula Kewensis, and the useful Pelargonium Clorinda. The same firm had a number of new ferns, including the beautiful Nephrolepis Whitmani.

ORCHID COMMITTEE.

Mr. G. G. Whitelegge, gardener to J. Bradshaw, Esq., The Grange, Southgate, submitted a fine lot of orchids, and the especial feature of the group was the number of white cattleyas; these were C. Trianæ Esmeralda, C. T. Oberon, C. T. Prima Donna, C. T. alba, and C. T. Lowiæ; besides these there were many beautiful white forms of Lycaste Skinneri, Odontoglossum Rolfæ Kathleen, O. excellens Lowiæ, O. Queen Alexandra—very fine, and O. Harryano-crispum. A few grandly grown orchids were submitted by Mr. H. Alexander, orchid grower to Major Holford, Westonbirt, Gloucester, and the varieties were as fine as the culture. There was an Odontoglossum Adrianæ with a spike 4ft. 6in. long, and carrying a hundred flowers; a number of beautiful O. crispum, O. Andersonianum Westonbirt var., O. Queen Alexandra, Cattleya Enid Westonbirt var., L.-c. Luminosa Westonbirt var.—very beautiful, Dendrobium Perseus aureum, and D. Melpomene.

Messrs. Sander and Son, St. Albans, showed Cypripedium Rothschildeanum, Odontoglossum Harvengtense nobilior, O. Lairesse, L.-c. Bletcheyense, the curious Ophrys speculum, O. fusca, O. lutea major, and Cœlogyne Lawrenceana, and Cynorchis Kewensis. Messrs. Hugh Low and Co., Enfield, contributed a group of orchids, dendrobiums and odontoglossums being the chief features; there were also Arpophyllum hyacinthum, Cypripedium Graceæ, and Cymbidium Wiganianum.

Odontoglossums were brightly shown by Mr. Balmforth, gardener to F. Menteith Ogilvie, Esq., The Shrubbery, Oxford; O. crispum was prominent in great variety, and there were examples of O. triumphans and O. crispo-Harryanum. Messrs. Charlesworth and Co., Bradford, submitted Lælio-cattleya Elinor (A.M.), a beautiful rich yellow hybrid from L. Coronet and C. Schroderæ; Odontoglossum amabile, O. Gladys, Odontioda Heatonense, and the curious Miltonia Warscewiczi. From M. T. Pauwels, Meirelbeke, Ghent, Belgium, came Vanda suavis pallida (F.C.C.), a fine plant carrying two spikes, one having a dozen big white and buff flowers.

A group of very beautiful odontoglossums was set up by those very capable growers, Messrs. J. and A. McBean, Cooksbridge, Sussex. The varied forms of O. crispum were lovely, and all grandly grown, and a few small ones were brightly coloured and of fine form. The general shape and substance of the blooms was remarkably good. O. Adrianæ, O. Harryano-crispum, O. c. King Richard, O. c. Titus, O. c. Campania, O. excellens, etc., were also included. Mr. G. E. Day, gardener to H. S. Goodson, Esq., West Hill, Putney, showed a small group of odontoglossums that included O. Vuylstekei, O. crispum Lily Bourdas, O. Harryano-crispum, as well as Angræcum Sanderianum and Miltonia Phalænopsis.

Mr. White, gardener to Sir Trevor Lawrence, Bart., Dorking, showed a big plant of Brasso-cattleya himalayana carrying about four dozen white and purple blooms—a cultural commendation was granted. Mr. De Barri Crawshay, Sevenoaks, sent up Odontoglossum Waltonense, O. Elector, and O. Carmen, the latter a very pretty cross between O. crispum and O. Crawshayanum. Cattleya Suzanne Hye de Crom (F.C.C.), a beautiful white cattleya with yellow-throated lip, was shown by M. Jules Hye de Crom, Ghent, Belgium. Messrs. Heath and Son, Cheltenham, contributed a few sophronites, Epiphronitis Veitchi, dendrobiums, and cattleyas, and had also a small exhibit of primulas, saxifragas, and other alpines.

Messrs. J. Cypher and Sons, Cheltenham, had an excellent group of orchids that included numbers of beautiful dendrobiums, cypripediums, Epiphronitis Veitchi, Sophronitis grandiflora, Odontoglossum ardentissimum, Cypripedium Beekmanni, and the pretty C. Venus. Mr. W. P. Bound, gardener to Sir J. Colman, Bart., Gatton Park, Reigate, showed a group of Dendrobium Thwaitesiæ, showed how greatly the seedlings from this cross between D. splendidissimum grandiflorum and D. Wiganiæ var.

Mr. A. W. Jenson, Lindfield, Sussex,showed both cattleyas and odontoglossums in variety. Mons. M. Mertens, Mont St. Amand, Ghent, brought over a few good odontoglossums and cypripediums, all unnamed. Messrs. T. Moore, Lim., Rawdon, Leeds, showed Epiphronitis Veitchi, numerous dendrobiums, Phalænopsis Schilleriana, dendrochilums, and cypripediums.

DAFFODIL COMMITTEE.

This committee had very little work to do. The only exhibit before it was one of forced daffodils, a very clean and bright lot of flowers, shown by Messrs. Barr and Sons, Covent Garden. The committee resolved that varieties gaining awards and certificates be placed on a separate table in one of the annexes instead of being returned to the group.

FRUIT COMMITTEE.

Mr. W. J. Russell, Cyprus, showed a lot of dishes of magnificent oranges. Some of the fruits were of unusual size; the varieties were not named, but there were both oval and round varieties, and the largest of the former were 1½lb. weight. Messrs. G. Bunyard and Co., Maidstone, and Mr. A. Dean, Kingston-on-Thames, both showed apples, the Maidstone firm staging thirteen dishes, but the fruits disappeared in a remarkable manner.

CERTIFICATES AND AWARDS.

First Class Certificates.—Vanda suavis pallida, from M. Theodore Pauwels, Meirelbeke, Ghent; Cattleya Suzanne Hye de Crom, from M. Jules Hye de Crom, Ghent.

Award of Merit.—Lælio-cattleya Luminosa Westonbirt var.; and L.-c. Enid Westonbirt var., from Mr. H. Alexander, orchid grower to Major Holford, Westonbirt, Gloucester.

MEDALS.

Gold.—Messrs. James Veitch and Sons, Chelsea.

Silver-gilt Flora.—Mr. Whitelegge, gardener to J. Bradshaw, Esq., Southgate; Mr. Alexander, orchid grower to Major Holford, Westonbirt, Gloucester.

Silver-gilt Knightian.—Mr. Ansel, Cyprus, for oranges.

Silver-gilt Banksian.—Mr. Eric Hambro, Hayes, Kent; Messrs. R. and G. Cuthbert, Southgate; Messrs. H. B. May and Sons, Edmonton; Messrs. W. Cutbush and Son, Highgate.

Silver Flora.—Mr. L. R. Russell, Richmond; Mr. G. Mount, Canterbury; Mr. Burnett, Guernsey; Messrs. Hugh Low and Co., Enfield; Messrs. J. and A. McBean, Cooksbridge; Mr. Jenson, Lindfield; Messrs. J. Cypher and Sons, Cheltenham; Mr. Day, gardener to H. Goodson, Esq., Putney; Messrs. H. Low and Co. (orchids).

Silver Banksian.—Mr. W. H. Page, Tangley Nurseries, Hampton; Messrs. H. Cannell and Sons, Swanley; Messrs. William Paul and Son, Waltham Cross; Messrs. Barr and Sons, Covent Garden (one for hardy flowers and one for daffodils); Mr. Menteith Ogilvie, The Shrubbery, Oxford; Messrs. T. Moore, Lim., Rawdon, Leeds; Messrs. Sander and Sons, St. Albans.

Bronze Flora.—Mr. Streeter, gardener to Mrs. Barton, Bramley, Guildford; Messrs. T. S. Ware, Lim., Feltham; St. George's Nursery Company, Harlington.

Bronze Banksian.—Mr. R. Sydenham, Birmingham.

LECTURE ON FLOWERING TREES AND SHRUBS.

At the afternoon meeting Mr. George Paul, V.M.H., presided over a crowded meeting of Fellows, when Mr. George Gordon, V.M.H., gave a lecture on "Beautiful Flowering Trees and Shrubs," illustrated by between sixty and seventy lantern slides.

In his opening remarks Mr. Gordon said that until within a quite recent period one of the weak points in the formation and management of gardens was the failure to appreciate the importance of the more beautiful forms of arborescent vegetation in the creation and improvement of garden scenery. As the result of this failure in days gone by large numbers of gardens now lack the beauty and the interest which they might, and indeed should, possess. In a considerable number we find trees that belong to the hedgerow and woodland, instead of trees of more moderate stature and remarkable for the beauty of their flowers or foliage, or distinguished by their elegance of growth. In the park and in pleasure grounds of so large an extent as to afford space for their development there was no objection to the arboreal features containing a due proportion of oaks and elms, and of chestnuts and beeches. But in gardens of moderate dimensions there was not room for forest trees, and, therefore, trees that are of moderate size, and possessing some distinctive attribute of beauty, should alone be planted. More especially did it appear desirable that trees and shrubs remarkable for the beauty of their flowers should be more fully utilised, for they are so numerous as to afford a wealth of material for the production of colour effects.

It might be said that, given mild winters, a continuous procession of flowering trees and shrubs might be had throughout the year. The number of kinds flowering during the winter months is somewhat larger than was generally supposed to be the case, and a considerable proportion were decidedly attractive. But his object was to direct attention to the more beautiful kinds that bloom when the garden can be fully enjoyed, and that can also be successfully grown under ordinary conditions, he should, therefore, have to pass over those blooming in winter, and take as his starting point the almonds and double-flowered peaches, whose attractively coloured flowers are so welcome in the closing days of March. The double-flowered peaches, of which there are white, pink, and brilliant red forms, were recommended as especially suitable for small gardens, for, while immensely attractive, they do not soon outgrow a very moderate amount of space.

The charm of the Snowy Mespilus (Amelanchier canadensis) was referred to, and the immense value of the deciduous magnolias flowering early in the season was insisted upon. Magnolia stellata, in its white and rose forms, the Yulan (M. conspicua), M. Soulangeana, and M. Lennei were suggested as the best for gardens in which the space is so limited that but few can be planted. Of these, illustrations of both flowers and finely developed specimens in bloom were thrown upon the screen, and appeared to be received with special favour by the audience. In Mr. Gordon's opinion, we have no trees more beautiful, hardy or otherwise, than the three magnolias mentioned, and it was matter for surprise that they are not met with in the gardens of all classes, instead of being represented in a comparatively few only.

Closely following the magnolias in their time of flowering are the plums and the elegant Double Sloe (Prunus spinosa fl.-pl.), the exquisitely beautiful P. triloba, and the charming P. sinensis, in its white and rose-coloured forms, were mentioned as especially desirable. Even more strongly recommended were the crabs (pyrus), which give such a wealth of delicately tinted blossom during the spring months. Special reference was made to Pyrus malus floribunda and its varieties, Scheideckeri being mentioned as one of the best of the latter, to the Siberian Crab (P. baccata), and to P. aria. P. baccata was described as a rather large-growing, round-headed tree, producing a profusion of white flowers, and P. aria as a handsome tree, pyramidal in growth, producing large clusters of white flowers that are followed by brilliant scarlet fruits. Double-flowered cherries were spoken of as not less valuable than the crabs, and the fine specimens of Cerasus avium fl.-pl. (multiplex), C. pseudo-cerasus, and C. pseudo-cerasus J. H. Veitch thrown upon the screen fully justified the high opinion of their merits that was expressed by the lecturer.

The laburnums and thorns were grouped together because of their flowering at much the same period. Owing to the variability of the seedlings of the common laburnum it was suggested that for prominent positions in the garden trees that have reached the flowering stage should alone be planted. The Scotch laburnum was specially recommended because of the shapely tree it forms, the profusion with which it blooms, and the great length of the racemes. The double-flowered thorns came in for a full share of praise, and deservedly so, for we have no more beautiful hardy trees that bloom late in spring. The double scarlet, the double pink, and double white, and the pendulous single white were suggested as the best of the forms of Cratægus oxycantha for general planting.

The immense improvement that had been made in the lilacs was referred to, and it was stated that the number of varieties had now become so large that selection from them was extremely difficult, more especially in the case of those who required a few only. Mr. Gordon suggested that the Council of the Royal Horticultural Society would render the Fellows good service were they to conduct a trial of lilacs at Wisley. Slides of specimens of Rubra de Marly, Louvainensis, and Syringa chinense were shown as examples of good culture. With reference to the latter, it was pointed out that while it was raised at Rouen from a cross effected between the common and Persian lilacs, the botanists gave it a name that suggested China as the place of its origin, that, until quite recently, it was commonly known as the Persian lilac, and that it is sometimes described as attaining a height of four or five feet, whereas a height of ten feet is quite common, and one of fifteen feet is not unknown to those well acquainted with these shrubs.

The usefulness of the berberis was referred to, and B. Darwini and B. stenophylla, and its double-flowered variety, were mentioned as the most desirable of the many kinds for general planting; and it was suggested that the pruning should be limited to the removal of the exhausted wood and cutting back branches that are extending beyond the allotted space. The brooms were passed under review, and the finest kinds mentioned, the Spanish Broom (Spartium junceum) being specially commended for the fine colour effects produced during the summer months. Viburnums were recommended as some of the most useful of the summer-flowering shrubs, and of these V. tomentosum plicatum was referred to as one of the best. The mock oranges (philadelphus), genistas, rhododendrons, Ghent and mollis azaleas, hydrangeas, catalpa, and many other trees and shrubs received attention, and the finest of these, as of the other kinds, were illustrated by slides of finely developed specimens.

At the close of the lecture votes of thanks were accorded the lecturer and chairman.

Gardeners' Royal Benevolent Institution.

The other evening a concert, under the auspices of the Liverpool Auxiliary of the Gardeners' Royal Benevolent Institution, was held at the Bear's Paw, and Mr. A. H. Bright presided over a large gathering. The large room was tastefully decorated with choice plants and flowers, contributed by Messrs. R. P. Ker and Sons, Messrs. B. Webb and Sons, and Mr. C. A. Young.

Birmingham Gardeners' Association.

There was a fairly good attendance of the members at the fortnightly meeting on the 9th inst., to meet Mr. A. R. Brown, florist, at King's Norton, who gave a very interesting discourse upon "Florist Flowers," raised twenty years or more ago. The various kinds were taken alphabetically, and a few remarks upon the chief varieties were pertinently alluded to. The auricula, which is Mr. Brown's favourite flower, and which he has cultivated and exhibited at the principal exhibitions in England with marked success, received a full share of attention. He commented upon the popularity of the alpine or fancy auricula, and on the charms of the old show section. Next in order came the tuberous begonia, the advance of improvement being almost marvellous in the size, form and colour of the flowers, and in the habit of the plant. Similar remarks apply to the carnation and picotee, one of the aims of the raiser and cultivator being the securing stiff and robust flower stalks to render the flowers more suitable for decorative purposes. The marked improvement in the "yellow ground" show carnation which is rapidly attaining to a high degree of popularity, was referred to. In adverting to the system of exhibiting carnations in vases for decorative purposes, the essayist, whilst approving of the same, maintained that to exhibit the blooms in the highest state of perfection it was essentially nesary to adopt the old "show-board" procedure. The marguerite carnation also came under observation as a border flower. The chrysanthemum also came in for a share of attention, and the growing popularity of the summer or early autumn section was referred to. With reference to the incurved section of chrysanthemums, Mr. Brown said that, although the present-day blooms were exhibited somewhat larger than formerly, they lacked the refinement possessed by those of yore. The daffodils and other narcissi were generally alluded to, as was the great advance that had been made in several classes, the Pheasant-eye section being Mr. Brown's choice. Dahlias had brief reference made to them, the improvement in the elegant cactus section being mentioned in appreciative terms, and the desirability of securing varieties with lessened leaf development and longer and stouter flower-stalks was mentioned. The varieties forming the pompon section were, Mr. Brown said, gaining popularity. The sweet pea, of course, came in for special recognition. There were also several other kinds of florists' flowers which were brought under notice.

There was an animated discussion, in which Messrs. Walter Jones (the chairman), T. Humphreys, W. Spinks, C. H. Herbert, W. Gardiner, A. H. Christie, —. Giles, and others took part. Mr. Brown was warmly thanked for his lecture.

Bristol Gardeners' Association.

A well-attended meeting was held on Thursday, March 12, at St. John's Parish Rooms, presided over by Dr. Shaw. Mr. Folwell, representing the Bath Gardeners' Debating Society, gave a practical discourse upon the cyclamen, which, the lecturer said, was one of the most beautiful and fascinating of winter flowers, and should be grown well from start to finish, or be left alone. The use of rain-water alone was advised, and it was recommended that the larger proportion of the potting compost should consist of leaf-mould, as in their natural habitat the plants are invariably found growing under trees. It was also suggested that the plants be not too firmly potted. Judging by the vase of lovely flowers and foliage he had on view, Mr. Folwell is a successful cultivator of cyclamens. Dr. Shaw opened the discussion, and was followed by Messrs. Curtis, Scott, Birfield, Holt, Thoday, House, Garnish, J. Clark, Shelton, and Woodward. Hearty votes of thanks were given to the lecturer and chairman at the close of the discussion. Certificates were awarded to Mr. Folwell for a vase of cyclamen, to Mr. Woodward for two pots of cyclamen, and to Mr. Jennings for Cœlogyne alba. A special certificate went to Mr. Hunking for Dendrobium Lang Tang, mountain variety, and Lælio-cattleya Bletchleyensis. For three pots of hyacinths Mr. Shelton was first; Mr. Thoday second.

East Anglian Horticultural Club.

This club is still adding to its already large membership, and at the March meeting, held at the Boar's Head Hotel, Norwich, Mr. W. L. Wallis, the secretary, was busy enrolling new members for some time. After the usual preliminary business had been disposed of, Mr. T. G. Bishop, manager of Messrs. Daniels Brothers' Nurseries, read a very interesting and instructive paper upon "Ornamental Shrubs." He dealt with both the flowering and foliage sections, pointing out those adaptable for town culture and also the best positions to place the choicer subjects in. As one might expect, he covered a very wide range, and his tit-bits of practical information introduced here and there were much appreciated.

During the discussion which followed other subjects not previously commented upon were mentioned. Mr. T. B. Field spoke of his fondness for kalmias, while Mr. E. Peake spoke in praise of escallonias; Mr. J. Forder is an enthusiast for shrubs adapted for culture on the bleak East Coast, and specified buckthorn and tamarisk. The president, Mr. J. Powley, gave his early association with the aucuba, and its diœcious mysteries, and on this subject Mr. Perry mentioned his experience with Skimmia japonica. Mr. H. Goude favoured azaleas and kindred subjects. There were other debaters, and keen interest was taken in the subject. Mr. Bishop received a hearty vote of thanks for his essay.

The exhibition tables contained some very fine pot plants, and fruits of apples and pears. In the former section the bulbous flowers from Mr. F. Williams, gardener to Louis Tillett, Esq., M.P., Catton, were superb, and with them he gained full marks in the Girling Silver Cup Competition. Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, was a good second, and had the best exhibit of cut flowers, and also the best single-flowering plant. Mr. E. Foulger was at the head of fruit exhibitors, and also did well for plants. Messrs. C. Hines, C. Burtenshaw, W. Rush, W. Laws, E. Goldspink, and C. Fox also contributed creditable examples to the exhibition tables. The next meeting is fixed for April 8, when Mr. H. B. Dobbie will give a lantern lecture upon "The Earth's Vegetation."

Weybridge Horticultural Society.

At the March monthly meeting of this society Mr. H. J. Wright gave an instructive lecture on "The Cultivation of the Strawberry." The sixty members present followed Mr. Wright's remarks very closely and appreciatively. Some very fine exhibits of cinerarias, primulas, and tulips were displayed, and over these, and the lecture there was a lengthy discussion. Hearthy thanks were accorded lecturer and exhibitors.

THE BULB MITE (RHIZOGLYPHUS ECHINOPUS).

In reference to the article on the Bulb Mite (Rhizoglyphus echinopus) which appeared in the "Journal of the Board of Agriculture" for March, 1905, the methods of treatment there given have now been revised, and should read as follows:

1. This pest is very difficult to combat because the extremely tiny mites feed not only on the outside of the bulbs, but between the leaf scales of the bulb, feeding and laying their eggs in the interior, where they can scarcely be reached. The best plan is to burn badly infested bulbs, for the mites which have penetrated into bulbs cannot be reached. Infested soil should not be used for other bulbs.

2. In the case of mites which are more external the bulbs should be sprayed with paraffin, the treatment being repeated a fortnight later; or the bulbs may be washed in sulphide of potassium (liver of sulphur), 1oz. to one gallon of water, or brushed with this after removal of the outside scale leaves. This treatment is useful against fungi which follow the attack of the mite.

3. Infested bulbs may be fumigated with bisulphide of carbon. The bulbs to be treated should be placed in an air-tight receptacle, and a saucer, containing the bisulphide of carbon, should then be placed on the top of them, and the receptacle closed. The bulbs should be left in the vapour for forty-eight hours. This treatment could be usefully extended to imported bulbs, which ought to be examined for the mite. The formula for fumigation on a larger scale is one pint of bisulphide of carbon to 1,000 cubic feet of space. Bisulphide of carbon fumes are very poisonous, and should not be breathed, and no naked light (the operator, for example, should not be smoking) must be brought near them.

GRAPES AND HOW TO GROW THEM.—An illustrated guide to propagation, culture, and management in vineries, greenhouses, and in the open air. By J. Landell, F.R.H.S. Price 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

ROYAL GARDENERS' ORPHAN FUND.

The coming of age festival of this charity takes place on May 12, 1908, and in view of this interesting event, the secretary, Mr. Brian Wynne, writes as follows from 30, Wellington Street, Covent Garden, London, W.C.:

It will be within the recollection of those lovers of horticulture and practical horticulturists who assisted so enthusiastically in the founding of this charity in 1887, as a gardeners' memorial of the Jubilee of our late revered Queen Victoria, that its inception was very largely due to a suggestion made by Mr. H. J. Clayton, then gardener at Grimston Park, Tadcaster, from whom the committee has received the interesting and suggestive communication annexed hereto, and of which your kind perusal is respectfully requested.

It is the desire of the committee and of all steadfast supporters of the fund that its coming of age, after such a successful minority, should be worthily celebrated, and with this object in view it has been arranged that a dinner in aid of the charity shall take place on May 12, at which the president, his Grace the Duke of Bedford, K.G., has kindly consented to preside.

The suggestion made by Mr. Clayton that advantage should be taken of so interesting an occasion in the history of the fund to further strengthen its financial position by means of a popular shilling collection, to be added to the noble president's dinner list, meets with the committee's most cordial approval, and is heartily commended to the generous consideration of all workers in horticulture.

The small sum asked for individually can hurt no one, while 10,000 shillings means £500, and this sum would make a memorable and most acceptable birthday gift to the fund. Of course, the success of such an appeal as is now made will necessarily depend upon the number of willing workers in private and public gardens, nurseries, and seed establishments, etc., whose sympathies with a good cause will induce them to make collections, which, however small, would be gladly welcomed, and all help towards realising the grand total.

In the hope that the suggestion as to this general collection, and the laudable object for which it is made, will meet with your sympathy and approval—as the committee most earnestly trust that it may—I have pleasure in enclosing a collecting sheet herewith, and shall be glad to send you some leaflets explaining the objects of the fund, if so desired, as well as to give you any information that you may require with reference to its rules and management.

It is desired that all returns of collections made may be sent in by May 10, at latest, but the earlier the better; and due acknowledgment will be made of all sums received.

Most earnestly soliciting your kind co-operation and generous assistance in this mission of mercy to the poor and unfortunate fatherless children of our own kith and kin.

B. Wynne, Secretary.

Creepers for Walls.—Now is a most excellent time to plant creepers or climbers for clothing house walls. The order should go to the nurseryman as soon as the kinds of plants are decided upon: and meanwhile the sites should be prepared. To do a strong growing climber, such as a rose or a wistaria, justice on a house wall, a cubic yard of soil should be displaced. If poor, use good turfy loam for filling in and wheel the original soil away; it pays to do this really well, as then twelve feet to twenty feet of growth in a season may often be secured. If the gravel runs right up to the house wall, place a few of the brown rope-twist pattern edging tiles round the bed. This will keep the soil at home, and greatly facilitate watering. William Allen Richardson is a splendid rose for this purpose, and the wistaria, white jasmine, and mountain clematis are deservedly prime favourites.—E. J. K.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

EMPLOYMENT AT KEW.—A. B., Lincoln: Apply by letter to the Curator, Royal Gardens, Kew, stating age and experience.

AGRICULTURAL LEAFLETS.—A. W. C., Cheltenham: The leaflets will be sent post paid, and free of charge, on application to the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W.

SHRIVELLED SWEET PEA SEEDS. — J. B. A., Shrewsbury: There is nothing the matter with the seeds. Some varieties have small, wrinkled, and marked seeds, and these, in comparison with the fine bold seeds of, say, Dorothy Eckford or Helen Lewis, appear to be ill-favoured. But this is only a varietal difference, and the seeds will germinate and produce as good plants as finer-looking seeds. Sow the seeds in pots in a greenhouse, transfer to a frame when the seedlings are two or three inches high, and plant out as soon as convenient.

SEEDLING POTATO.—H. T. P., Olney: The potatoes are evenly pebble-shaped, of fair size, and excellent cooking quality. The variety evidently keeps well and loses not of its quality in the keeping. For table use we consider it very good, but, of course, we are not in a position to give any opinion as to its cropping power, habit, or freedom from disease. Your best plan is to communicate with Mr. S. T. Wright, superintendent of the Royal Horticultural Society's gardens, Wisley, Ripley, Surrey, and ask that the variety be tested with other maincrop sorts. He will then let you know what quantity to send for seed purposes. It is only by a comparative test of this sort that the merit of the variety may be proved.

MOVING GOOSEBERRY BUSHES. — S. D. G., York: We should not hesitate to move the gooseberries at once, but we should arrange so that the roots of the bushes were exposed hardly at all. If you have some old potting soil, leaf-mould, and road grit, mix these together in equal proportions and remove the rougher portion; then use the finer material to bed the roots of the gooseberries in. Plant firmly, and quickly; give the bushes sufficient support against wind, and water them in thoroughly. The check will be so small as to be hardly noticeable. Pick the fruits green, so that the bushes may not be distressed. Directly dry warm weather is imminent, mulch the soil around and over the roots with short manure.

ROYAL HORTICULTURAL SOCIETY'S MEDALS.—E. A. H., Sheffield: This question is asked frequently. The medal awards made by the R.H.S. are as follows: (1) The Lawrence Gold Medal: This medal is only to be struck in gold. It is to be awarded independently by the direct vote of the Council, who will, as a rule, confine themselves to not more than two votes to amateurs and two to trade exhibits during the year. (2) The smaller gold medal: This medal is struck only in gold. (3) The Flora medal: This medal is awarded to flowers and ornamental plants, and is struck in three grades, silver-gilt, silver, and bronze. (4) The Hogg medal and (5) the Knightian medal: These medals are awarded to fruits and vegetables, and are struck in three grades, silver-gilt, silver, and bronze. (6) The Lindley medal: This medal is usually given to exhibits of botanical interest or for exceptional skill in cultivation, and is struck in three grades, silver-gilt, silver, and bronze. (7) The Banksian medal: This medal is used in all departments of the society's work, and is struck in silver-gilt, silver, and bronze.

FAILURE WITH TULIPS AND NARCISSI.—W. A., Bermondsey: The bulbs are, apparently, suffering from the effects of some outward application. The impure atmosphere would not be responsible for partial failure in certain beds, though beds near to a chemical works would suffer more from deleterious depositions than those further away. In the case of the tulips we feel sure that something unusual has occurred; it appears as though some material had been dropped inside the opening leaves, killing the flower bud, and causing the base of the leaves and the heart of the bulb to rot. Pretty much the same sort of thing would happen if a few drops of paraffin, or a good pinch of salt or nitrate, were dropped into each plant. In the case of the daffodils the evidence of mischief is not so clear, and the two bulbs sent were immature, non-flowering ones; but, of course, it would be much more easy to damage tulips than daffodils, owing to the formation of the leafage.

HERBACEOUS PLANTS FOR TOWN GARDEN.—G. G., Liverpool: The following selection comprises plants that can be depended upon to thrive in the majority of towns in which smoke and other impurities are above the average: Aquilegia Witmanni, Aster acris, A. amellus bessarabicus, A. a. roseus, A. formossimus, A. Novæ Angliæ William Bowman; A. Novi Belgi Robert Parker, A. puniceus, A. spectabilis major, Aubrietia deltoidea, Armeria plantaginea, A. vulgaris, Baptista lutea, carnations in variety—seedlings, because of their greater vigour, are especially desirable, Cardamine pratensis fl.-pl., chrysanthemums, summer-flowering, in variety; Campanula glomerata; Dodecatheon giganteum, Iberis corifolia, I. sempervirens, I. tenoreana, Iris primula, I. germanica, in variety—these are especially desirable for the pleasing effect produced when not in bloom; Orobus vernus, phloxes, spring and summer flowering, in variety; pyrethrums, single and double, in variety; pæonies, herbaceous, in variety; Saxifraga atro-roseus, S. spathulata, S. rotundifolia, Trollius asiaticus, T. altaicus, violas in variety.

CONSERVATORY PLANTS.—E. C., Malvern: It is not possible to give a complete answer to your question in these columns. The subject is a large one, indeed sufficient for a book of considerable size. You should consult our "Work for Week" columns, and act upon the advice given therein. You will also find the "Gardening Year Book" (post free, 1s. 2d., Gardeners' Magazine Office, 148, 149, Aldersgate Street, E.C.) very useful in this particular direction, as well as in others. In January the conservatory should be well supplied with forced bulbs and forced flowering shrubs; Chinese primulas, cyclamen, and arums are other leading subjects. For February there are the forced subjects, Calceolaria Burbidgei, Indian azaleas, and camellias. In March there should be no lack of bulbs in flower and forced azaleas, spiræas, Primula obconica, heaths, epacrises, clivias, freesias, etc. For April there are later batches of bulbs, clivias, hippeastrums, acacias, zonal pelargoniums, and carnations. For May there are early gladioli, clivias, vallotas, acacias, boronias, heaths, eupatoriums, cinerarias, calceolarias, gently forced mollis azaleas, and other shrubs, Sparmannia africana, streptocarpuses, etc. For June there are calceolarias, cinerarias, pelargoniums, and begonias, impatiens, arums, streptocarpuses, Rehmannia africana, Bougainvillea glabra, chorozemas, heaths, heliotropes, plumbagos, rhododendrons, etc. In July and August the garden is so gay out of doors that the conservatory need not be kept so bright, but there will be begonias and pelargoniums, heliotropes, achimenes, heaths, bougainvilleas, leschenaultia, streptocarpuses, schizanthuses, etc., to arrange with ferns and foliage plants. For September there are the later batches of summer flowers, many heaths, agapanthuses, Luculia gratissima, fuchsias, etc. October should find early chrysanthemums in flow humeas, eupatoriums, heaths, oleanders, and early salvias. November is the month chrysanthemums, scarlet salvias, with a few forced bulbs for the end of the month. I December we depend chiefly upon chrysanthemums, azaleas, carnations, winter-flowering begonias, eupatoriums, and forced bulbs.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

J. T., Shurt.—Cornus mas.

S. A. F., Torquay.—Pittosporum Tobira.

E. O. G., Mansfield.—Leucadendron argenteum.

J. H. J., Hull.—1, Crocus aureus; 2, Leucojum vernum.

R. H. J., Dalkeith.—1, Leonotus leonurus; 2, Eupatorium ianthinum.

H. A., Skipton.—1, Clematis indivisa lobata; 2, Grevillea Thelemanniana.

F. E. W., Cromer.—1, Odontoglossum luteo-purpureum; 2, O. pulchellum.

D. S. R., Streatham.—1, Kerria japonica fl.-pl.; 2, Acacia platyptera; 3, Pentas carnea.

C. F. G., Leicester.—1, Libonia floribunda; 2, Mussænda frondosa; 3, Masdevallia tovarensis.

M. E. B., Weston-super-Mare.—1, Daphne Mezereum; 2, Claytonia sibirica; 3, Arabis alpina; 4, Cydonia japonica.

A. N., Bedford.—1, Lycaste Skinneri, 2, a species of callipsyche, probably C. eucrosiodes; 3, Thyrsacanthus rutilans.

R. P., Shaftesbury.—1, Hæmanthus sanguinea; 2, Scilla bifolia; 3, Saxifraga ligulata; 4, Berberis canadensis; 5, Eranthis hyemalis.

M. M., Bournemouth.—1, Arum italicum; 2, Erythronium dens-canis; 3, Forsythia viridissima; 4, not recognised; 5, Omphalodes verna.

C. P. L., Rotherham.—1, Erica gracilis; 2, Boronia serratifolia; 3, Jasminum Sambac; 4, Dendrobium devonianum; 5, Monochætum sericeum; 6, Lachenalia Nelsoni.

PRUDENTIAL ASSURANCE COMPANY, Limited,

Chief Office HOLBORN BARS, LONDON.

Invested Funds exceed £68,000,000.

SUMMARY of the REPORT presented at the FIFTY-NINTH ANNUAL MEETING, held on the 5th March, 1908.

ORDINARY BRANCH.—The number of policies issued during the year was **86,080**, assuring the sum of **£8,156,865**, and producing a new annual premium income of **£466,357.** The premiums received during the year were **£4,480,377**, being an increase of **£189,406** over the year 1906. The claims of the year amounted to **£2,430,117.** The number of deaths was **8,243**, and **12,328** endowment assurances matured.

The number of policies in force at the end of the year was **843,206.**

INDUSTRIAL BRANCH.—The premiums received during the year were **£6,661,631**, being an increase of **£162,603.** The claims of the year amounted to **£2,563,090.** The number of deaths was **281,990**, and **4,494** endowment assurances matured. The number of free policies granted during the year to those policyholders of five years' standing and upwards who desired to discontinue their payments was **128,429**, the number in force being **1,290,758.** The number of free policies which became claims during the year was **32,104.**

The total number of policies in force at the end of the year was **17,459,835**; their average duration exceeds eleven years.

The assets of the Company, in both branches, as shown in the balance sheet, are **£68,006,284**, being an increase of **£4,119,276** over those of 1906.

In pursuance of the policy indicated in the last report, a scheme was approved by the Shareholders at meetings held in July last, admitting Industrial Branch policyholders, and the Superintendents, Assistant Superintendents, and Agents to specified shares in the profits of the Company.

The Directors are pleased to announce that in the Ordinary Branch a reversionary bonus at the rate of **£1 12s.** per cent. on the original sums assured has again been added to all classes of participating policies issued since the year 1876.

In the Industrial Branch a bonus by way of addition of 5 per cent. to the sums assured will be paid on all policies of over 5 years' duration, which become claims either by death or maturity of endowment from the 6th of March, 1908, to the 4th of March, 1909, both dates inclusive.

Messrs. Deloitte, Plender, Griffiths and Co. have examined the securities, and their certificate is appended to the balance sheets.

D. W. STABLE, } Joint

NEW PLANTS, ETC.

◆

ERIA LONGISPICA.

A very curious Bornean orchid, producing a strong iris-like growth, and spikes about fifteen inches long, the latter crowded with small yellow, brown, green, and purple flowers. It thrives under stove treatment. "Bot. Mag.," t. 8,171.

PHILODENDRON COISINIANUM.

A bold and handsome aroid, and one that is of hybrid origin. It was raised by Messrs. Makoy, of Liege, and P. verrucosum is probably one of the parents. It is a stove climber, and has deep-green leaves from 1¼ to 2¼ft. long, and purple and green beneath. The spathe is crimson-purple, dotted with crimson, brown, and white. This is the first hybrid philodendron recorded. "Bot. Mag.," t. 8,172.

PÆONIA MLOKOSEWITSCHI.

A very beautiful yellow pæony from the Caucasus. It is a herbaceous perennial, has bluish-green leaves, and big bright yellow flowers. It is quite hardy under the treatment usually accorded herbaceous pæonies. A useful addition to the garden. "Bot. Mag.," t. 8,173.

VIBURNUM UTILE.

First discovered near Ichang in 1880, this shrub was introduced to cultivation by Messrs. James Veitch and Son, through their collector, Mr. E. H. Wilson. It grows about 5ft. high, and bears comparatively small flowers in dense terminal cymes; these are white, and followed by smooth black fruits. Quite hardy, free, and effective. "Bot. Mag.," t. 8,174.

HERBERTIA AMATORUM.

A pretty irid, from South America. Under greenhouse or frame culture it flowers for a long period, though individual flowers are short lived. The blooms are two inches across, rich violet-blue, with brown markings at the base of the inner segments. "Bot. Mag.," t. 8,175.

PSEUDOLARIX FORTUNEI.

A beautiful garden tree, and apparently a rare one in China. It will grow as high as 120-130ft., but needs good deep soil to be a success. It was originally discovered by Fortune, in Chekiang, in 1853. During spring the young foliage is yellowish green, and again in the autumn the leaves assume a rich golden-yellow hue before falling, hence the species is well called the Golden Larch. "Bot. Mag.," t. 8,176.

FORTHCOMING ENGAGEMENTS.

WEDNESDAY, March 25.—Society of Arts.
Royal Botanic Society's Spring Show.
Junior Horticultural Examination at the Royal Horticultural Hall.
FRIDAY, March 27.—Beckenham Horticultural Society; lecture on "Syringing and Damping Down."
TUESDAY, March 31.—Royal Horticultural Society; Fruit, Floral, Orchid, and Narcissus Committees meet at 12 o'clock; lecture at 3 o'clock on "The History of the Cabbage Tribe," by the Rev. Prof. G. Henslow; Scientific Committee at 4 o'clock.
WEDNESDAY, April 1.—Society of Arts.
Winter Flowering Carnation Society at Royal Horticultural Hall.
Hayward's Heath Gardeners' Association; lecture on "Seakale and Rhubarb," by Mr. Jarrett.
THURSDAY, April 2.—Linnean Society Meeting.
TUESDAY, April 7.—Brighton Spring Show; two days.
Croydon Gardeners' Association; lecture on "Peaches and Nectarines," by Mr. Seabrooke.
National Amateur Gardeners' Association; lecture on "Beautiful Arrangements of Roses," by Mr. G. Gordon, V.M.H.
WEDNESDAY, April 8.—Examination in Horticulture at the Royal Horticultural Hall.

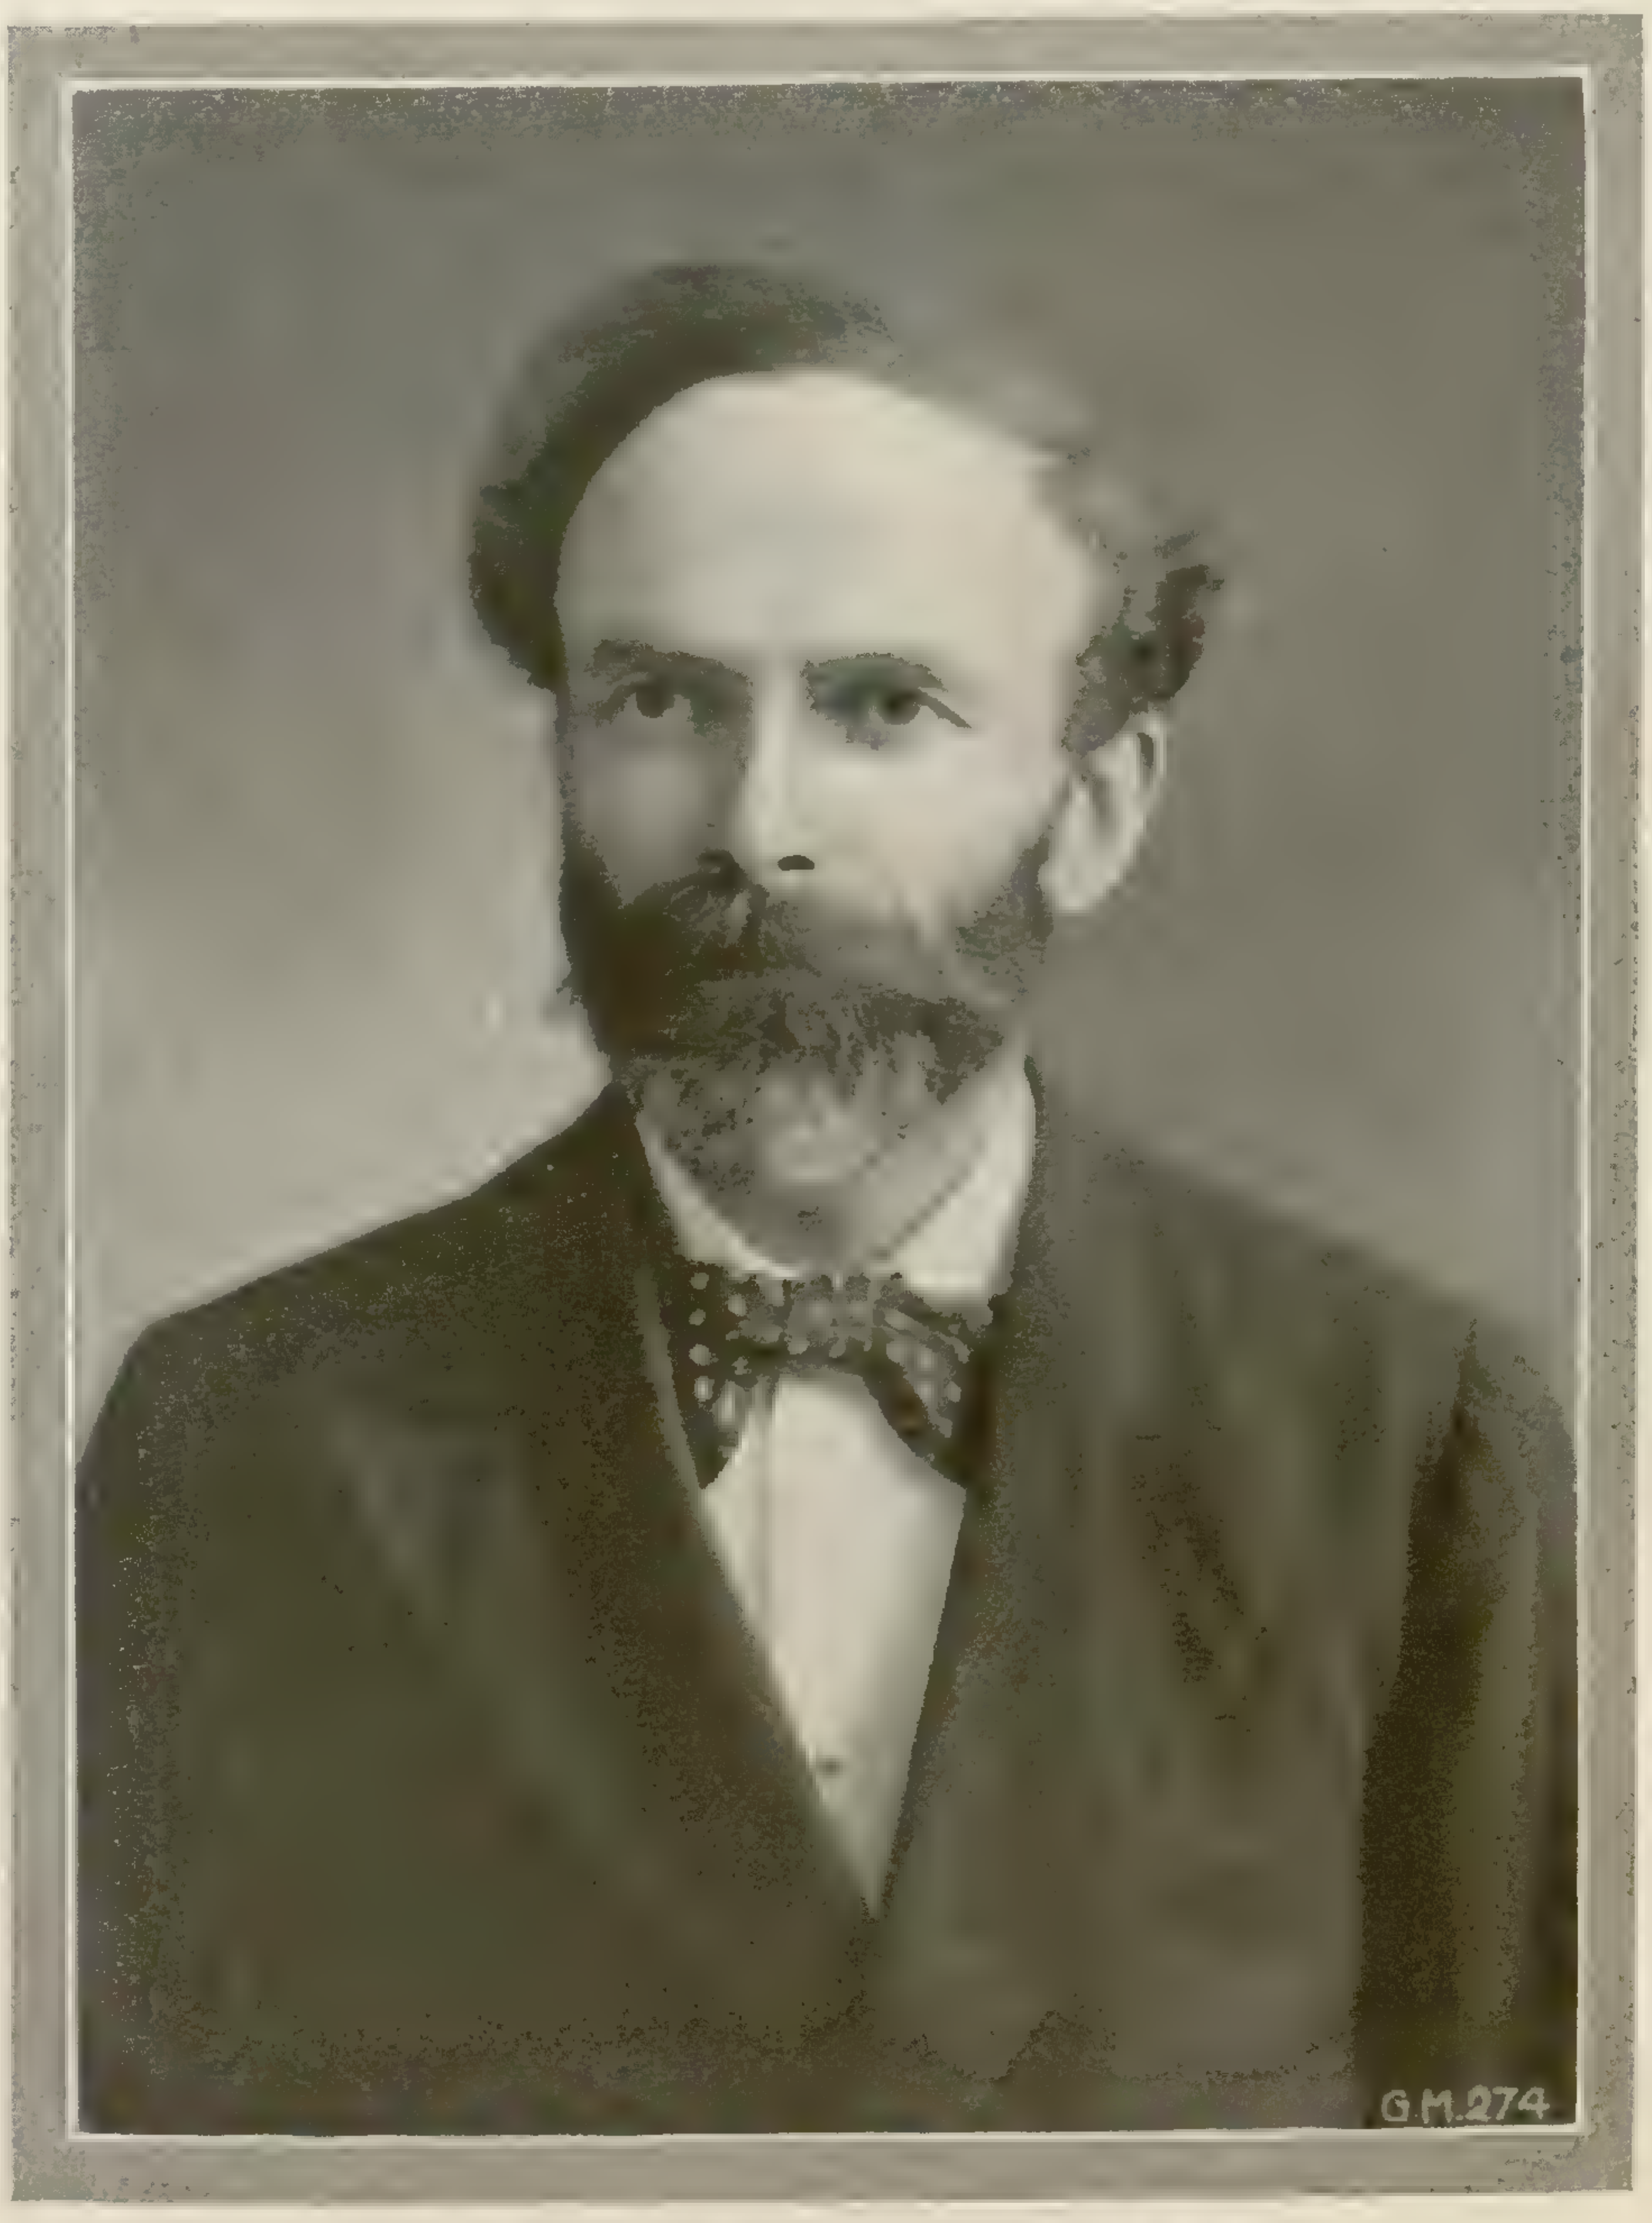
NOTES OF THE WEEK.

Plant Skeletons.

Although we cannot find any such hard lime-built systems of bones in plants as are common in the animal kingdom as a supporting framework for the tissues which form the flesh and vital organs, there is, nevertheless, in most plants a well-defined system of nicely distributed woody material which serves the same purpose, and is equally wonderful in its variety, and, when dissociated, in its beauty. Occasionally, but, we think, too rarely, we see beautiful examples of plant skeletons at our floral exhibitions, in which not merely the leaves or fronds with all their beauty and intricate vein systems are shown, but also the seed vessels, and even, in some cases, the fruits. A familiar idea of the complexity of the internal framework is given by the so-called loofahs used in our baths, which are derived from a species of gourd deprived of its soft cellular tissues. This, we think, is the only instance where such skeletons, in their intact form, are of commercial value; but in view of the beautifully designed and intensely hard internal skeletons of the opuntia, or prickly pear cactus, of which there are successive layers in the old thick pseudo-leaves of that genus, it is a great pity that good use of such is not make in inlaid cabinet and other work, for which Nature has fashioned them to perfection. Unfortunately, the operation of skeletonising is a tedious and delicate one, and not altogether devoid of unpleasant features, since it can only be effected by thoroughly rotting out the soft and perishable cell matter, which has then to be removed from its supporting framework prior to cleansing and bleaching the resulting skeleton, which may be of almost gossamer-like delicacy and brittle to boot. Nature occasionally does a little skeletonising on her own account in our gardens, when somewhat tough leaves display their denuded bones in the course of decay in places where that ever-busy sexton, the earthworm, has failed to find them; and at this time of the year we may get a glimpse of more complicated structures, where the spherical bladders of the physalis have partly rotted away and display the contained fruit like a cherry in a cage. We may also obtain an idea of the multiformity and general diversity of plan by holding up almost any fallen leaf to the light and noting the beautiful gradation of the veins, which, being sheathed in a woody integument, would, under proper treatment, stand alone as the skeleton. No two are alike even on the same tree, while between one species or genus and another the differences will be marvellous. Between the plant skeleton and the animal skeleton there is one fundamental difference in function. The bones of an animal constitute a mere supporting system capable of acting also as levers, in some cases, under the influence of the contracting and expanding muscles attached to them. They take absolutely no part in the circulation of the blood, and their service may be described as purely mechanical. In the skeleton of a leaf, however, we see preserved the circulatory system as well as that which acts as a mechanical support. The bones here are practically solidified sap channels through which, when the leaf was clothed with living cell tissues, the necessary sap was conveyed from below, and, this being elaborated, was used in conjunction with the absorbed carbonic acid from the air, to form the various components required for the service of the plant. These were in due course, distributed backwards through these channels to the various parts where they might be required to build up wood, fruit, or a store of nutrition, as the case might be. If we could watch the growth of the foliage we should always see the embryo vein structure acting as a sort of pioneer to cell formation, and the vein system of a leaf is precisely akin to the water-distributing system of a water company, with its great mains and smaller ones branching off them according to need of the thoroughfares traversed, and finally tapering away into domestic or other supply pipes as terminals. The return system, however, that we have spoken of puts the plant on a higher level of design and complexity, and demonstrates once again how far the works of Nature transcend the works of man.



MR. ROBERT NEWSTEAD, A.L.S.,
Lecturer in Economic Entomology at the University of Liverpool.

Mr. Robert Newstead, A.L.S., whose portrait it gives us special pleasure to present in this issue, has had a career as wonderful and varied as any depicted in the realms of fiction. Leaving school when ten years of age Mr. Newstead entered a printer's establishment at Aylsham, in Norfolk, but while there he qualified for and eventually secured a position as assistant telegraphist. But in 1872 he returned to school for six months, and then for ten years he followed the horticultural profession, and this association with horticulture made him familiar with the difficulties of the gardener's calling, and in later years he has frequently rendered the gardeners of Chester and district very much assistance in entomological matters. After his horticultural experience Mr. Newstead turned his attention to agriculture, in 1882, but after two and a-half years' experience he returned to his chief love, horticulture. But the wide experience he had gained and the careful studies he had made now bore fruit, and in 1886 Mr. Newstead was appointed Director of the Grosvenor Museum at Chester, a post he ably filled for nearly twenty years; indeed, until in April, 1905, he was appointed Lecturer in Economic Entomology and Parasitology at the University of Liverpool. In early life Mr. Newstead was a keen student of natural history, especially of entomology and ornithology; and he was associated with the late Miss Eleanor Ormerod, and also with the Duke of Bedford in the elucidation of life histories and remedies for insect pests and plant diseases. Mr. Newstead is an honorary member of the Royal Horticultural Society, and was elected an associate of the Linnean Society in 1902. There is not space here to tell of Mr. Newstead's many scientific treatises, of his work for the Home and Colonial Governments and several of the universities, and so we conclude this all too brief notice of splendid achievements with an expression of the hope that the effort now being put forth to establish a Dutton Memorial Chair of Tropical Entomology and Archnology in the Liverpool School of Tropical Medicine and the University of Liverpool, will be abundantly successful, because there is not the slightest doubt that the first person to fill the chair would be Mr. Robert Newstead.

Norwich Gardens.—In accordance with the announcement made in our issue of the 21st inst., we shall give in the issues for April 11 and 18, a fully illustrated description of a considerable number of the more noteworthy gardens in the vicinity of Norwich which has long been known as a "City of Gardens." The gardens that will be described will include those of Ashwellthorpe Hall, Blickling Hall, Boyland Hall, Crown Point, Dunston Hall, Gunton Park, Oakland House, Shotesham Park, Town Close House, and Westwick Hall.

Winter-Flowering Carnations will be extensively displayed at the Royal Horticultural Hall on Tuesday, April 1, when the society devoted to the interests of these flowers holds its exhibition. The annual dinner of the Winter-Flowering Carnation Society will be held at the Hotel Windsor at seven p.m. the same day, and will be followed by the annual meeting at eight o'clock.

Mr. R. H. Biffen has been elected to the recently established chair of Agricultural Botany at Cambridge University. Mr. Biffen is the author of numerous papers, the earlier of which dealt with the preparation of india-rubber and the coagulation of latex, and he has devoted a great deal of attention to fungi. His researches on the hybridisation of wheat and barley have attracted the attention of civilised Governments throughout the world, and attempts have been made, says "Nature," to induce him to leave England and place his services at the disposal of at least one foreign Government. It is satisfactory that largely owing to the generosity of the Drapers' Company Mr. Biffen will be able to continue to carry on his researches at Cambridge.

Elementary School Gardens. A Bill to promote agricultural education and nature study recently passed its second reading in the House of Commons. The Bill, introduced by Mr. Jesse Collins, provides, among other things, for school gardens in connection with elementary schools. The kind of education specified in the Bill is to be compulsory for rural and semi-rural districts, but optional in urban districts.

Metropolitan Public Gardens' Association.—Under the presidency of the Earl of Meath, this useful association continues to do good work in securing more open spaces for the Metropolitan district, in planting trees, laying out old gardens, and providing seats wherever there are suitable places for them. The twenty-fifth annual report of the association has just been issued from the offices at 83, Lancaster Gate, W., and proves most interesting reading. We have space only to point out that the chief work of the association during 1907 was in connection with the opening of Purley Beeches, Croydon; and Barking Road Recreation Ground, East Ham; the presentation of 1,500 plane and poplar trees to West Ham; the promotion of window gardening competitions in the poorer parts of the Metropolis; and the opposition to schemes that would have tended to spoil the beauty and usefulness of Hampstead Heath, Golders' Hill, and Milford Common.

Veitch Memorial Prizes.—We are informed that the Veitch Memorial Trustees will offer a first prize of £10 and a silver medal, a second prize of £5 and a bronze medal, and a third prize of a bronze medal for collections of five distinct varieties of grapes, three bunches of each variety, to include two distinct white varieties, at the Royal Horticultural Society's Fruit Show on October 15 and 16 next. They will also offer £5 and one medal for the best group of winter-flowering carnations, either in pots, or as cut flowers, or as a combination of both, to occupy a space of 100 square feet, at the Royal Horticultural Society's meeting of December 8, 1908, and the first meeting in April, 1909. All these competitions are open to amateurs only, and the exhibits must in each case be grown by the competitor.

Dr. Augustine Henry, whose introduction of many new and useful Chinese plants, and whose great assistance to Mr. Wilson made the introduction possible of many more fine plants from Western China, are well-known to our readers, was married last week to Miss Alice Brunton, daughter of Sir Lauder Brunton, the well-known physician. Dr. Henry has studied forestry in many countries since his retirement from the Chinese Customs Service, and he is now Reader in Forestry at Cambridge. Dr. and Mrs. Henry are spending their honeymoon on the Continent.

National Dahlia Society.—This important society will hold its exhibition at the Royal Horticultural Hall, on September 3 next. The schedule of prizes offered is now before us, and we find that in the trade section there are five classes devoted to show and cactus dahlias, five to cactus varieties, two to pompones and two to single varieties. In the amateurs' division there are six classes for show and fancy dahlias, eight for cactus varieties, two for pompones, three for singles, and four for decorative exhibits. There are ten open classes, chiefly for decorative exhibits of dahlias and suitable foliage. The schedule contains a "Dahlia Analysis" by Mr. Edward Mawley, V.M.H., the president of the society. With the schedule a supplement to the official catalogue and culture guide is sent. The new hon. secretary of the society is Mr. H. H. Thomas, [illegible] Shakespeare Road, Hanwell, Middlesex.

Trentham Park and Hall for Stoke.—The order of the Local Government Board for the federation of Stoke-on-Trent, Hanley, Burslem, Tunstall, Longton, and Fenton provides that the new borough, to be called Stoke-on-Trent, shall come into existence in November. The new borough will have an area of 11,154 acres, and a population of 236,000 people. The federation of these six pottery towns makes it possible for the district to accept the Duke of Sutherland's generous offer of the gift of Trentham Hall and Park for purposes of recreation.

Cotoneaster Simonsi at Hartpury House.—Mr. H. Prentice, of Hartpury House Gardens, Gloucester, sends us a few sprays of Cotoneaster Simonsi, each bearing a profusion of large brilliant orange berries. Mr. Prentice writes: C. Simmondsi is a grand wall plant as it is covered with brilliant berries throughout the autumn, winter and spring months, providing a picture of beauty that is admired by all who see it. A wall on the north front of Hartpury House is covered with it, and although the birds have stripped the plants in the shrubbery they have not touched a berry on the wall plants. It is surprising how quickly this cotoneaster will cover a wall if the growths are laid in at full length wherever there is room for them, and the other growths are spurred back in early autumn but not so as to remove any berries. One wall, sixteen feet high, is still a perfect blaze of orange-scarlet berries.

Grove Hall Park, Bow.—Of this finely wooded estate only about three and a-half acres now remain unbuilt on, and an effort is being made to save this from the hands of the builders, and preserve it for the people and children of Bow. About £200 of the needed purchase money remains to be subscribed. We understand that the London County Council have promised a liberal contribution towards the cost of acquisition, and will take over and maintain the property if it is acquired.

Nitric Diet and Nitro-bacterine.—Some little difficulty has arisen in connection with the two distinct subjects, i.e., Nitric Diet, and Nitro-bacterine, both of which are advertised in our columns. Some of our readers have not been careful to observe the correct title and address of the proprietors of these articles, and consequently some confusion has arisen. Nitric Diet is supplied only by Messrs. R. J. Barnes and Son, Wyche Road, Malvern, and inquiries for Nitro-bacterine should be addressed to Nitro-bacterine, "Review of Reviews" office, Norfolk Street, London, W.C.

Children's Spring Flower Shows.—Scotland sets an excellent example to the rest of the kingdom in her encouragement of children's flower shows. Within the last few days Dundee has held its exhibition, and there were 2,600 flowers staged, chiefly hyacinths, daffodils, and tulips, all grown by children. At Perth the children made no fewer than 4,000 entries, producing a fine display; and Dunfermline had 982 juvenile exhibitors from ten of its schools.

A New Ornamental Musa.—At a meeting of the Acclimatisation Society of Paris, M. A. Chevalier, who has returned from his mission to West Africa, called attention to a new musa found growing at Fouta-Djallon. This species, which has been given the name of Musa Mastreti, has a strong resemblance in its habit to M. ensete, and is remarkable for its large glaucous leaves. The fruits are cylindrical, bright yellow, and with but little pulp. They are eatable, but of poor quality. The species is of interest from the fact that the altitude at which it grows justifies the belief that it will be found quite as hardy as M. ensete, and therefore useful for the embellishment of the conservatory and the ornamentation of the pleasure grounds during the summer months.

Retrospective Exhibition of Chrysanthemums.—At the Paris Chrysanthemum Show in November last the librarian of the National Horticultural Society of France exhibited a large number of books from the society's library dealing with the chrysanthemum, and also many old coloured engravings of varieties long since discarded by growers. It is now announced that at the next exhibition in Paris there will be a special arrangement made for exhibiting articles of interest, literary and artistic, connected with the flower. The preliminary announcement says that the exhibition will consist of two parts. Firstly, books, publications, prints, engravings, pictures, and old catalogues relating to the chrysanthemum. Secondly, classes for old chrysanthemums in cultivation prior to 1896. There is no doubt but that Mr. Harman Payne's recently published bibliography of the chrysanthemum in the Journal of the National Horticultural Society of France (since issued in separate form) has done much to stimulate the literary interest among the French growers, and the exhibition in the first section will probably be of much educational value to those students of horticultural literature in France who are chrysanthemum lovers. In the second section there should be some probability of a good show. There are still in cultivation many old flowers raised forty to fifty years ago which will probably be best represented by the incurved and anemone sections. Queen of England, Alfred Salter, Beverley, Mr. Bunn, Empress of India, Mrs. G. Rundle, Fleur de Marie, Gluck, Mrs. Pethers, King of Crimsons, and perhaps a number of the old Japanese may still be found in some collections, and will be an object lesson for our French friends who have certainly done their part in the improvement of the modern show chrysanthemum.

Solomon Islands Indigo.—A collection of dried plants made in Ysabel Island, presented to Kew, in 1893 by Archdeacon Comins, included a "dye-plant used by natives for staining their tappa cloth." It was identified with Desmodium brachypodum, A. Gray, a species previously only known to inhabit Australia, where it has a wide range in the coastal region of New South Wales and Queensland. Further specimens were received in a collection made by the officers of H.M.S. "Penguin" in 1894-5; but these are not localised. Recently Mr. C. M. Woodford, Government Resident, British Solomon Islands, sent specimens to Kew accompanied by the following note: "I now send some dried specimens and some seeds of a shrub from Ysabel Island for identification. It is the source of the native indigo dye, and so far as I know is peculiar to Ysabel. It is used for colouring the native bark cloth. The leaves are sprinkled with salt water and slightly wilted in the sun. They are then chewed by the women and the result is a dull blue stain in the mouth which has a very unpleasant appearance. To stain the cloth the women spit or smear the saliva upon it, altogether a very primitive and objectionable process."

LILACS.

Following on my notes of the best lilacs to grow (p. 178), a few remarks relative to methods of cultivation, will not be out of place.

To grow lilacs really well, that is to obtain large panicles of fine flowers, the situation the plants are to occupy is important. Avoid a site where they will be robbed of their full share of light and space, or where the roots are interfered with by those of tall-growing forest trees, like the elm for instance. Air and sunshine are factors not to be ignored, and ample space is important. As to soil, the lilac is not at all particular; any deeply trenched well enriched garden soil is suitable; that which is inclined to be heavy is better than that of a sandy character, as in the former the rich colours are more pronounced. For established plants a liberal top-dressing of bonemeal in the spring, lightly forked in for the benefit of the surface roots, will be an advantage, following this with a mulching of half-decayed farmyard manure mainly for the purpose of conserving the moisture in the soil during the months of April and May when the flower panicles are developing.

Copious supplies of liquid manure early in May will be an advantage not only to the development of the current season's flowers but also for future growth of wood and leaves, as upon this depends the success of the future harvest of flowers.

As the newer varieties are grafted on various stocks, at no time should the sucker-like growths which freely spring from the stock below the graft be allowed to remain, as they rob the plants of that vigour which is necessary to the development of large flower panicles and the increased size of the individual flowers. The removal of suckers as they rise is most essential in the case also of lilacs on their own roots whether new or old.

The habit of growth differs very considerably, scarcely are there two varieties alike, some make compact bushes, while others are most ungainly. When planted it is well to prune the previous year's growth down to within an eye or two of the base with a view of inducing a better foundation for the future bush. Afterwards the cutting of the flowers will pretty well keep the plants within the required space, except that an annual examination of the growth is time well spent, removing then the weakly shoots that cannot give vigorous flower spikes, and thus allowing more space for the strong branches to develop.

E. Molyneux, V.M.H.

A FINE SPECIMEN OF A FINE LILAC.

Syringa alba grandiflora. Flowers, pure white.

THE VIOLET.

(Concluded from page 226.)

◆

Viola odorata.

This well-known plant is in a wild state spread over Europe and Russian Asia, and is common in various parts of Britain, while it is grown in almost every garden, and enormous quantities of it are sold in Paris, London, and many other cities. Its delicious odour distinguishes it from other violets. It may be grown where almost everything else but weeds would fail, forming carpets for open groves or the fringes of woods, of hedges, the open parts of copses, or for banks. It should fringe shrubberies, rock-gardens, or ferneries. In such positions it requires no care, and rewards the planter by filling the March air with unrivalled sweetness. It will grow on almost any soil, but best on free sandy loam, as I said before. It is well to naturalise the plant on sunny banks, fringes of woods, and on the warmer sides of bushy places, to encourage a very early bloom.

The cultivation of the sweet violet is of great importance, not only for private gardens but also to supply the vast demand for it in large cities. About Paris the cultivation of the sweet violets for the markets is largely carried on, and in some places three or four acres may be seen covered with these flowers. The ground is well exposed to the midday sun, and is rich, free, and warm. The plantations are made in the spring, and, of course, those required for the winter markets are grown in frames. Violets do not like forcing, nor do they need it if their crowns are ripened early.

The violet is said to have derived its name from the Goddess Io, on whose behoof, when in the form of a heifer, violets were made to spring from the earth. Whatever may have been the fabled perfections of that creation of old world imagination, they could not have connected the name with associations so sweet and elevating as those which it owes to the simple flower. The word violet breathes music and poetry without reference to any goddess. It was so much esteemed in ancient Athens that it was engraven in tablets all over the city. The citizens coveted no higher title than that of "Athenian" crowned with violets. The Romans, too, admired the flower, and showed their appreciation of it in ways suited to their genius. They cultivated it extensively in their gardens, and were particularly partial to a wine distilled from its flowers.

In the games of flowers held at Toulouse in the picturesque days of the troubadours, a golden violet was the prize awarded for the best poetic composition. The violet was the chosen flower of the lady who instituted the games. While undergoing imprisonment she sent it to her true knight as a pledge of her constancy, of which virtue it henceforth became symbolic among the troubadours. Thus early was it associated with poesy. Nor has the warrior disdained it. It was the chosen badge of Napoleon Bonaparte. During his exile his officers were in the habit of toasting him as "Corporal Violette"—the flower that returns with the spring. Even with the epicure has it found favour. A sherbert made of extract of violets was much esteemed in the East, of which Mahomet is reported to have said that it surpassed all other extracts, as far as he himself excelled the rest of creation.

Coming down to more recent times, we find it figuring largely in popular superstition, being regarded as lucky in some circumstances and unlucky in others. A pretty fancy that the nightingale only sang above a bed of violets is referred to by Milton in these lines:

"In the violet embossed vale,
The love-lorn nightingale
Nightly her sad song mourneth well."

The confectioner's art, too, has caught this sweet flower in its meshes. Fuller has snatched it from its rightful home and place in the world of flowers, crystallised it, and put in on our dessert tables. "Give me," cries one, "the substance of a thing," something that I can eat, or drink, or feel.

"A Poem for the money it will bring,
Flowers for the dainty meal."

It was also greatly esteemed for supposed medicinal qualities. In England in the olden time it was the recognised emblem of fidelity. Thus an old sonnet has it:

"Violet is for faithfulness."

Shakespeare tells of

"Violets dim,
But sweeter than the lids of Juno's eyes."

and sings

"To throw a perfume on the violet
Is wasteful and ridiculous excess."

Wordsworth, when he would convey an idea of the sweetness of a young maiden, compares her to

"A violet by a mossy stone
Half hidden from the eye,
Fair as a star when only one
Is shining in the sky."

As for Tennyson, he is continually referring to the violet. He weaves them in a "Wreath of March." One of the first signs of approaching spring he notices is that

"Thick,
By ashen roots the violets grow."

And again the sentiment he puts into the mouth of his May Queen is very emphatically his own:

"O sweet is the new violet that
Comes beneath the skies."

William Howitt says:

"Pluck the violets blue,—
Ah, pluck not a few,
Knowest thou what good thoughts
From Heaven the violet instils?"

So precious are they in the eyes of another poet that he sees them gleaming like amethysts in the dewy grass.

Sir Walter Scott gives us this gem:

"The Violet in her greenwood bower
Where birchen boughs with hazel mingle,
May boast itself the fairest flower
In copse or forest dingle."

We might have expected that in the New World beyond the Atlantic, new flowers would usher in the everywhere welcome season. But even there the modest violet is not overlooked. An American poet in proclaiming its return couples the old-world flower with a new-world bird. He says:

"The blue-bird and the violet are with us once again."

And this gem from James Russell Lowell:

"Violet! Sweet Violet!
Thine eyes are full of tears,
Are they wet
Even yet
With the thoughts of other years?
Violet! dear Violet!
Thy blue eyes are only wet
With joy and love of Him who
Sent thee,
And for the fulfilling sense
Of that glad obedience
Which made thee all that
Nature meant thee."

Tennyson again in his "Maud" sings thus:

"From the meadow your walks have left so sweet
That whenever a March wind sighs,
He sets the jewel-print of your feet
In violets blue as your eyes,
To the woody hollows in which we meet,
And the valleys of Paradise."

Homer speaks of "meadows purpled o'er with violets" as a "scene to fill a god with wonder and delight." Milton, with Eden's flowers to select from, requires "pansies and violets" to help in the formation of a couch in Paradise. This idea is fanciful. I do not know who wrote it:

"The violet varies from the lily as far
As oak from elm—one loves the soldier, one
The silken priest of peace—one this, one that."

Again yet another voice:

"Of all the flowers that make the earth so fair,
That bloom about our path where'er we go,
Give me the violet that lies hidden there,
And sheds its fragrance when soft breezes blow.

Like some dear friend for whose return we long,
We welcome thee, sweet harbinger of spring,
And hasten with the tribute of a song
For all the tender thoughts that thou dost bring.

When long ago in childhood's happy day,
We sought thee under April's fitful skies,
When through lone woods we rambled far away,
And wondered if ye bloomed in Paradise.

'Twas sweet humility that bade thee hide
Thy purple blossoms neath a lap of green,
Thy fragrance serving as the only guide
To woo us to the spot where thou wert seen.

And how year after year thou didst return
And lead our thoughts o'er half-forgotten ways,
Like some old song that we were wont to learn,
Thou whisperest fondly of our early days.

Fair flower, adieu, and thou shalt ever find
Upon my bosom a safe place to lie,
Secure from every storm and boisterous wind,
Breathe out thy life and in thy sweetness—die.

My pen is at the bottom of a page,
Which, being finished, here the story ends,
'Tis to be wished it had been sooner done,
But stories somehow lengthen when begun."

And where can the pen stop when it writes of so sweet a flower as this?

H. C. PHILBRICK.

Daphne Mezereum. — This common daphne, generally known as the Mezereon, is a British plant, and is a pretty object in gardens, where it is too little planted. Then its upright, leafless shoots are thickly covered with flowers, which, expanding on the bare branches, have a very pleasing effect. The type has rosy pink blossoms, and there are several named varieties, alba having white flowers, alba flore pleno double white, and atro-rubra deep red blooms. A collection of the different varieties will afford a charming picture when all the plants are in flower. The blossoms are succeeded by bright red berries, which, in the summer, are almost as attractive in their aspect as the flowers. The white-flowered varieties often bear orange-yellow fruits instead of red. Young plants are easily raised by sowing seed, and the seedlings will generally be found to vary considerably in the colour of their flowers.—S. W. FITZHERBERT.

SWEET PEA STREAK.

Fortunately for me I am practically unacquainted with what is termed streak in sweet peas. That there is something attacking plants in various directions, and under different conditions, is apparent by the alarmed statements that reach one from time to time. Perhaps it is only natural to suppose that something would come along in eerie form, appearing only to a chosen few before showing itself all round. A peculiar class of plants are these leguminosæ; it matters not whether they are annuals, herbaceous or shrubby, or perennials, they are all endowed with what are termed root nodules. Yet in spite of their individuality as regards free nitrogen it cannot be said that any one of them is an unconcerned agent when cultural methods are applied.

In restricted areas, where it is almost necessary to grow plants of this order repeatedly, whatever the annual treatment may be as regards manures, we should in time expect to be troubled with either fungoid or insect pests of sorts, more especially if preventive measures of some kind were not adopted. If we study the career of many of our popular garden plants we find that there have been times when their strength has been sorely tried, and we cannot expect the sweet pea to escape visitations from disease, more especially with overcrowding, and over-manuring with both organic and inorganic foods. If we require the finest products for exhibition purposes, animal or vegetable, these are treated out of their natural course to achieve some end, but such things at the end of their treatment lack stamina, they are constitutionally weaker, and in a sense, out of training—cannot stand sudden climatic changes without serious checks because of their succulent nature.

So far as we have heard, what is known as streak has only occurred with amateurs, but under what cultural or climatic conditions the plants have been grown we are not able to state. In cases where peas have gone off in the mysterious manner described by some growers, we should think it folly to attempt to grow in the same ground for some time unless unusually stringent measures were taken in every possible direction, and consider it the height of folly to use old sticks, wires, or other supports unless disinfected with a powerful insecticide strong enough to kill latent spores that may remain from the previous year, and in bad cases we should advise applying gas lime to the soil. The elaborate preparations advised by many growers for these plants, if carried out, need plenty of lime or chalk to keep the soil in a basic condition, and this is especially the case where acid manures like superphosphate of lime are given, and also when much ammonia sulphate is used.

The symptoms, so far as an outsider is able to judge, would appear to favour the opinion that eelworm is the cause of the mischief, and if such is the case it should be easy to diagnose. Striped flowers are plentiful enough during wet, cold seasons without stem disease, it is this latter we should like to be assisted in by having specimens sent for inspection. Suggestions have been made for cultural directions to be given in a definite form by the National Sweet Pea Society, even then we think each cultivator would pursue his own course, certainly no one course could be stated as being applicable to every grower.

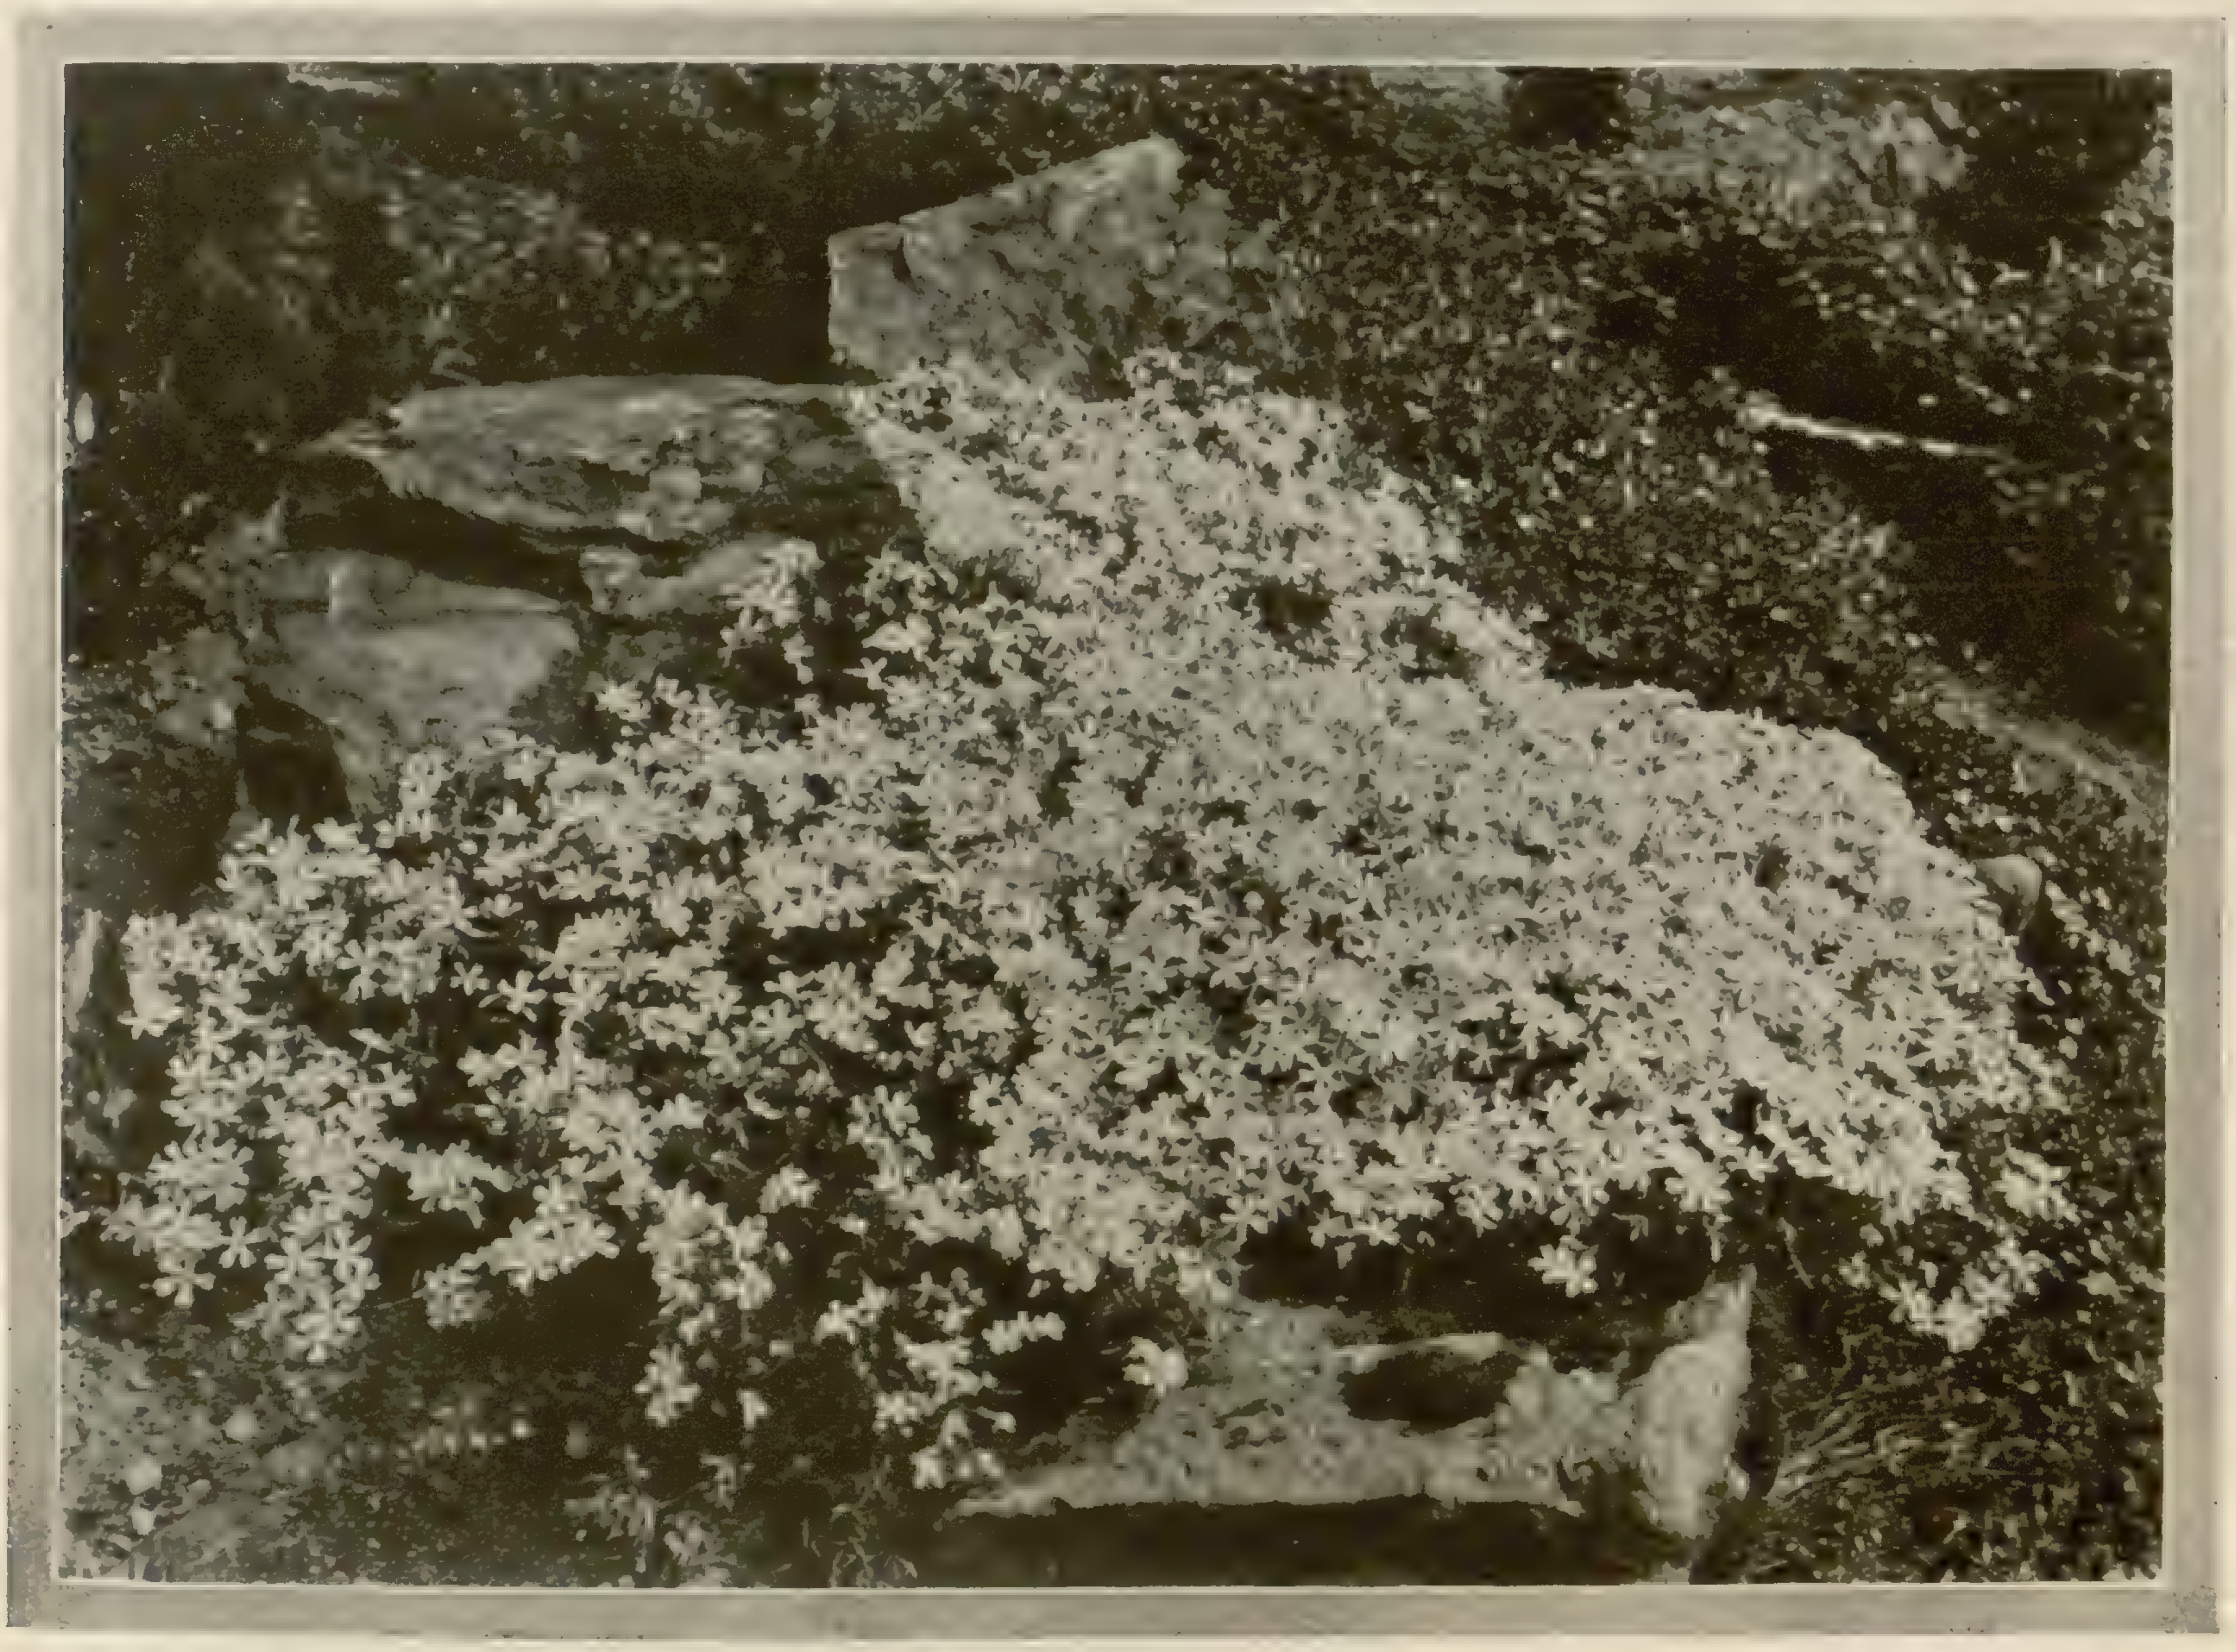
CHARLES FOSTER.

University College, Reading.

PHLOX STELLARIA.

This dwarf free-flowering plant is a charming subject for the rock garden. It is of looser growth and rather more upright habit than the majority of alpine phloxes, and therefore is very distinct in character. The flowers, produced in the greatest profusion, are silvery-grey, changing to white with age, and a big patch of this plant clambering over the rocks as we have it here at Mullaboden presents a delightful picture. Phlox stellaria loves a deep sandy soil in which a goodly amount of half-decayed leaf-mould has been mixed. As regards position there is no question that P. stellaria should be planted in full sunshine, because only in such a place is it seen to the fullest advantage. Fortunately, this species is easily propagated from cuttings, and these should be taken in the summer, after the flowering season is over, and put in firmly in boxes of sandy soil; if placed in a cold frame and kept shaded for a couple of weeks the cuttings root readily, and fine sturdy plants result.

Mullaboden. W. J. MITCHISON.



PHLOX STELLARIA IN THE ROCK GARDEN AT MULLABODEN, BALLYMORE EUSTACE

Dividing the Broad-leaved Saxifrage.—Time was when we called this plant Megasea cordifolia, but the modern dictum is for Saxifraga crassifolia. However, under either name it is one of the best of all hardy plants for the spring garden; and it is also not to be despised as a pot plant for the cold greenhouse. My object in writing now is to advise those who have old plants not to let the season pass without splitting them up, if they are any way bare in the centre. Single crowns severed and put in now make nice bold tufts of foliage later, and throw up really magnificent flower spikes which last a long while.—E. J. K.

LARGE ASPARAGUS AND HOW TO GROW IT.

Although many people, and perhaps with good reason, still prefer the small greenish-purple heads of asparagus, there is undoubtedly a strong demand—one that is making itself felt in private establishments—for the long white stems formerly imported solely from the Continent, but now placed on the market by several growers in England. Providing the soil is a fairly rich loam, and well drained, the production of large heads is an easy matter, but in wet, heavy clay lands more difficulty is experienced. Even when the ground has been drained sufficiently for ordinary crops the roots of the asparagus are liable to decay in winter.

Preparing the Ground.

In such soil it may be necessary to take out trenches two feet deep and one yard apart, their lower ends connected with a pipe drain, and if closely-bound green faggots, or eight-inches of brick rubbish are placed in the trenches, ample drainage will be secured, and the soil may be filled in. The whole ground should be moved to a depth of eighteen inches at least, keeping the richest spit at the top for the young plants to grow in, not burying the best soil, as is too often done. Advantage should be taken of frost to wheel on a heavy dressing of manure, that from the farmyard being the best for light soils: horse manure, wood ashes, or decayed refuse for those of a heavier nature. Fork it in in dry weather, bringing all the clods to the top and breaking them up, reducing the whole to a friable condition for planting in March or sowing the seeds in April.

Whether the soil is light or heavy, I much prefer to sow the seeds where the plants are to remain. For want of space plants are often raised elsewhere, and transplanted when one or two years old, but a slight check is sure to occur, and this is much increased when the plants are obtained from a distance; and if the roots are dried, badly packed, and roughly handled, the result may be disastrous.

Sowing the Seeds.

Sow the seeds on a fine day, when the soil appears quite dry, but is really moist beneath. The drills may be drawn one yard apart and two inches deep. Place the seeds in groups of six, at about eighteen inches apart, covering them and raking the ground level. Radishes, lettuce, or some such crop can be grown between the rows the first season. Weeds will most likely make their appearance before the asparagus. Dispose of them by using the Dutch hoe, first stretching a garden line over the drill and weeding it by hand. In a few more days the needle-like points of the seedling asparagus will be discerned, and as they grow the groups should be thinned gradually, until only the strongest plant is left in each. Timely support of the tallest grass and frequent hoeing is all that is needed. Watering will accelerate growth, but is not absolutely necessary.

Manuring the Beds.

In autumn, when the ripened growths are cleared away, sprinkle 1½oz. of kainit per square yard over the ground. A dressing of dung, suitable to the soil, may be given in winter, and forked in in February, being careful not to disturb the young plants. When the latter have attained some height, and the ground has been warmed by the sun, give another coating of flaky manure, such as that from an old hotbed. This may be four inches thick, and it serves two purposes—it keeps down the weeds, and conserves the moisture during summer. Manure of a more stimulating kind can be given by applications of finely-sifted nitrate of soda once a month during the growing season, at the rate of 1oz. per yard. Salt, though often recommended, is of doubtful benefit, and as the kainit already advised contains a large proportion, as well as potash, no other need be used. The writer has often seen exceptionally fine asparagus grown entirely without salt of any kind.

It is indispensable that the young plants should be firmly staked. They should now be growing strongly, and reach, in July, a height of four feet or more, and have as many as six or seven stems. When these are ripened and cleared away in November kainit and dung may be applied as before, and, in addition, superphosphate at the rate of 5oz. to every two yards, in spring.

Blanching the Stems.

As a few heads may be gathered from each plant in the following spring means must be taken to blanch them. Seaweed is often used for this purpose, the bed being thickly coated with it, but as most people are unable to obtain it, the French method is the best one to adopt. If the soil and the numerous top-dressings are forked up lightly in February and exposed to the action of frost, etc., a fine dry tilth is obtained. Such soil, after the Dutch hoe has been passed through it, is generally in fine condition for earthing up the crowns in a manner similar to that followed for potatoes. It must be done in dry weather, and the hills or ridges should be large. Asparagus earthed up in this way is ready to pull when the tops of the shoots appear through the ridges. An asparagus knife is then useful for removing a small quantity of the soil when the stalk is "pulled" or twitched off. During the fourth or fifth season the plants will, of course, be much stronger, and more may be expected of them, but the cutting should not be too severe, or protracted beyond the later days of June.

Planting Asparagus.

March is the best month to transplant the crowns. After the ground has been prepared take out a broad flat trench four inches deep with the spade, and placing the crowns at the right distance apart spread out their roots horizontally, covering them with the finest soil, and pressing it around them. Only a few plants should be lifted at one time, and these should never be allowed to dry. The treatment afterwards is the same as for seedlings; alternate plants may be removed for forcing in the third year, leaving the permanent plants a yard apart each way. Crowns that have been transplanted are more likely to benefit by waterings in June and July than those sown where they are to remain.

The Best Varieties.

Giant French is undoubtedly the largest and finest, but the stems are not numerous, and are produced rather late. Connover's Colossal is an early free-bearing kind, but only of moderate dimensions. Early Giant Argenteuil is a splendid variety, and combines many good qualities; it is largely grown for the Paris markets, but succeeds equally well in this country. All these three have purplish heads, but another Continental kind, known as Giant White Head has heads of a pale green colour. J. Comber.

Nymans Gardens, Handcross.

There is no better guide to the kitchen garden than Vegetables and Their Cultivation, by T. W. Sanders. It is a complete treatise on the general management of the garden, and the successful culture of vegetables, saladings, and herbs for home use. Price 5s. net, by post, in box, 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

PHLOX DRUMMONDI.

These brilliantly-coloured varieties of Phlox Drummondi may be said to have taken the place of the verbena in the flower garden, though even now they are probably less commonly grown than almost any of the well-known bedding annuals. The reason for this lack of popularity is probably not far to seek, for they want the best possible cultivation if they are to be really a success, thin, weedy, straggling plants—the result of letting them take their chance, in laissez-faire style, with other annuals—giving no satisfaction whatever. I once heard someone remark that Shirley poppies would grow on a dust-heap, a remark which was verbally true, though no experienced grower would be satisfied with the result. So with Phlox Drummondi. Few annuals give a greater variety of brilliant colours, salmon-rose, pink, deep crimson, bright scarlet, violet, yellow, blush white, pure white, etc., while some have dark eyes, some white, and some none at all.

Though a somewhat fragile plant, even when well grown, it is not nearly so much injured by summer storms as many of the summer flowers are, and, though it may be beaten down, and the blossoms splashed with mud, yet it soon recovers, and, given a renewal of bright weather, and a judicious watering to clean the blossoms and foliage, it will show little trace of the rough treatment it has received after a few days. Some sorts grow only six inches in height, while others grow a foot or more, and lend themselves to very effective table decoration if suitably arranged, an operation which calls for a good deal of judgment.

These phloxes are only half-hardy annuals, and should be treated accordingly. To get them in bloom before the summer is too far advanced—and lateness of coming into flower is rather a drawback with many of the bedding annuals—they should be sown in gentle heat in light, rich soil in March, pricked off in boxes as soon as they are large enough to handle, and kept in a moderately cool house. If one has not a house at one's disposal, or cannot spare room, they may be sown in a cold frame at the end of March, and treated in the same way. In either case they should never be allowed to become stunted, either in the seed pan, or after being pricked out, for they never recover from it. The essential principle is to keep them growing straight on under the best conditions from the time the seedlings are up until they are put in their summer quarters. They should be hardened off gradually, not being set in full sunshine outdoors until their foliage has become thoroughly inured to the dry air. It is recommended to pinch out the central shoot when the plants are three or four inches high to induce a bushy growth and prolong the flowering season.

It is as small beds on the lawn that Phlox Drummondi shows off to the greatest advantage in all its brilliancy of colouring, and it is in this position that we can give it the conditions best suited to it. The site selected should be as sunny a one as possible, and if the bed has been well prepared the plants will stand a great deal of hot weather before they need watering. It is useless to plant them in shady or half-shady places, as no good results are ever obtained with them in this way, and it is equally useless putting them in a cold clay soil, unless long cultivation and rich manuring has improved the soil out of knowledge. I think the best beds of them I have ever seen have been in the chalk districts of Wiltshire, from which it may be inferred that a chalky soil is most favourable to them. If they do not get a sufficiency of sun and air, or if the soil is of too close a texture, they make thin weedy branches, showing the soil between; whereas in a suitable position as regards soil and sunshine, their growth is much more compact, with flowering shoots from every axil, the effect being a display of colour which few beds can beat. The plants may be put fairly closely together, say four to six inches in a hot position, when they will support each other; or they may be given more space, say, eight to ten inches, and some of the branches pegged down like verbenas. The best effect is produced when closely planted, the ground being covered more quickly, while the general growth of the bed is more uniform in height. Of course, much must depend upon the sorts grown, those growing a foot high obviously permitting of different treatment from those growing only six inches, for which there is only one way, as a bed.

Though recommended principally for bedding, there are other purposes for which these annual phloxes may be used, though the individual flowers may not, and probably will not, be so large, nor the effect so good, as when grown on specially prepared soil, and massed together. The dwarf varieties make good edgings to beds and borders, and where used in this way it is better to buy seeds of one colour only, though when filling a whole bed with them the mixed colours are more effective, as they generally contain a fair proportion of whites or light colours, and these serve to show up the others. The dwarf varieties, too, make good pot plants for the greenhouse, especially if cuttings are struck in autumn, when they will flower well in early spring. The taller varieties are sometimes used with good effect for carpeting the ground between taller plants when the soil has been well treated, though it would be useless planting them in such positions where the roots of strong-growing plants abstract both food and moisture. With beds of standard roses, where the soil has received a good mulching of manure year by year, and is therefore in good heart, and where, moreover, it can be cultivated to a depth of six or eight inches without seriously interfering with the roots of the rose trees, the taller varieties of these phloxes make a very good ground-work, growing just high enough to hide some part of the bare stems, but not making a dense enough growth to injure the well-being of the roses. For hanging baskets and for window boxes and balconies, they may be used to good purpose when well grown.

The Continental growers have done a great deal in improving the strain of Phlox Drummondi, and have given us not only larger flowers, but several different forms of it, among which may be mentioned Hortensiaeflora, a beautiful large-flowered dwarf strain of spreading growth, and Cuspidata, with irregularly-shaped carollas, which have developed spines, thus quite altering the character of the flowers, giving them the appearance of stars.

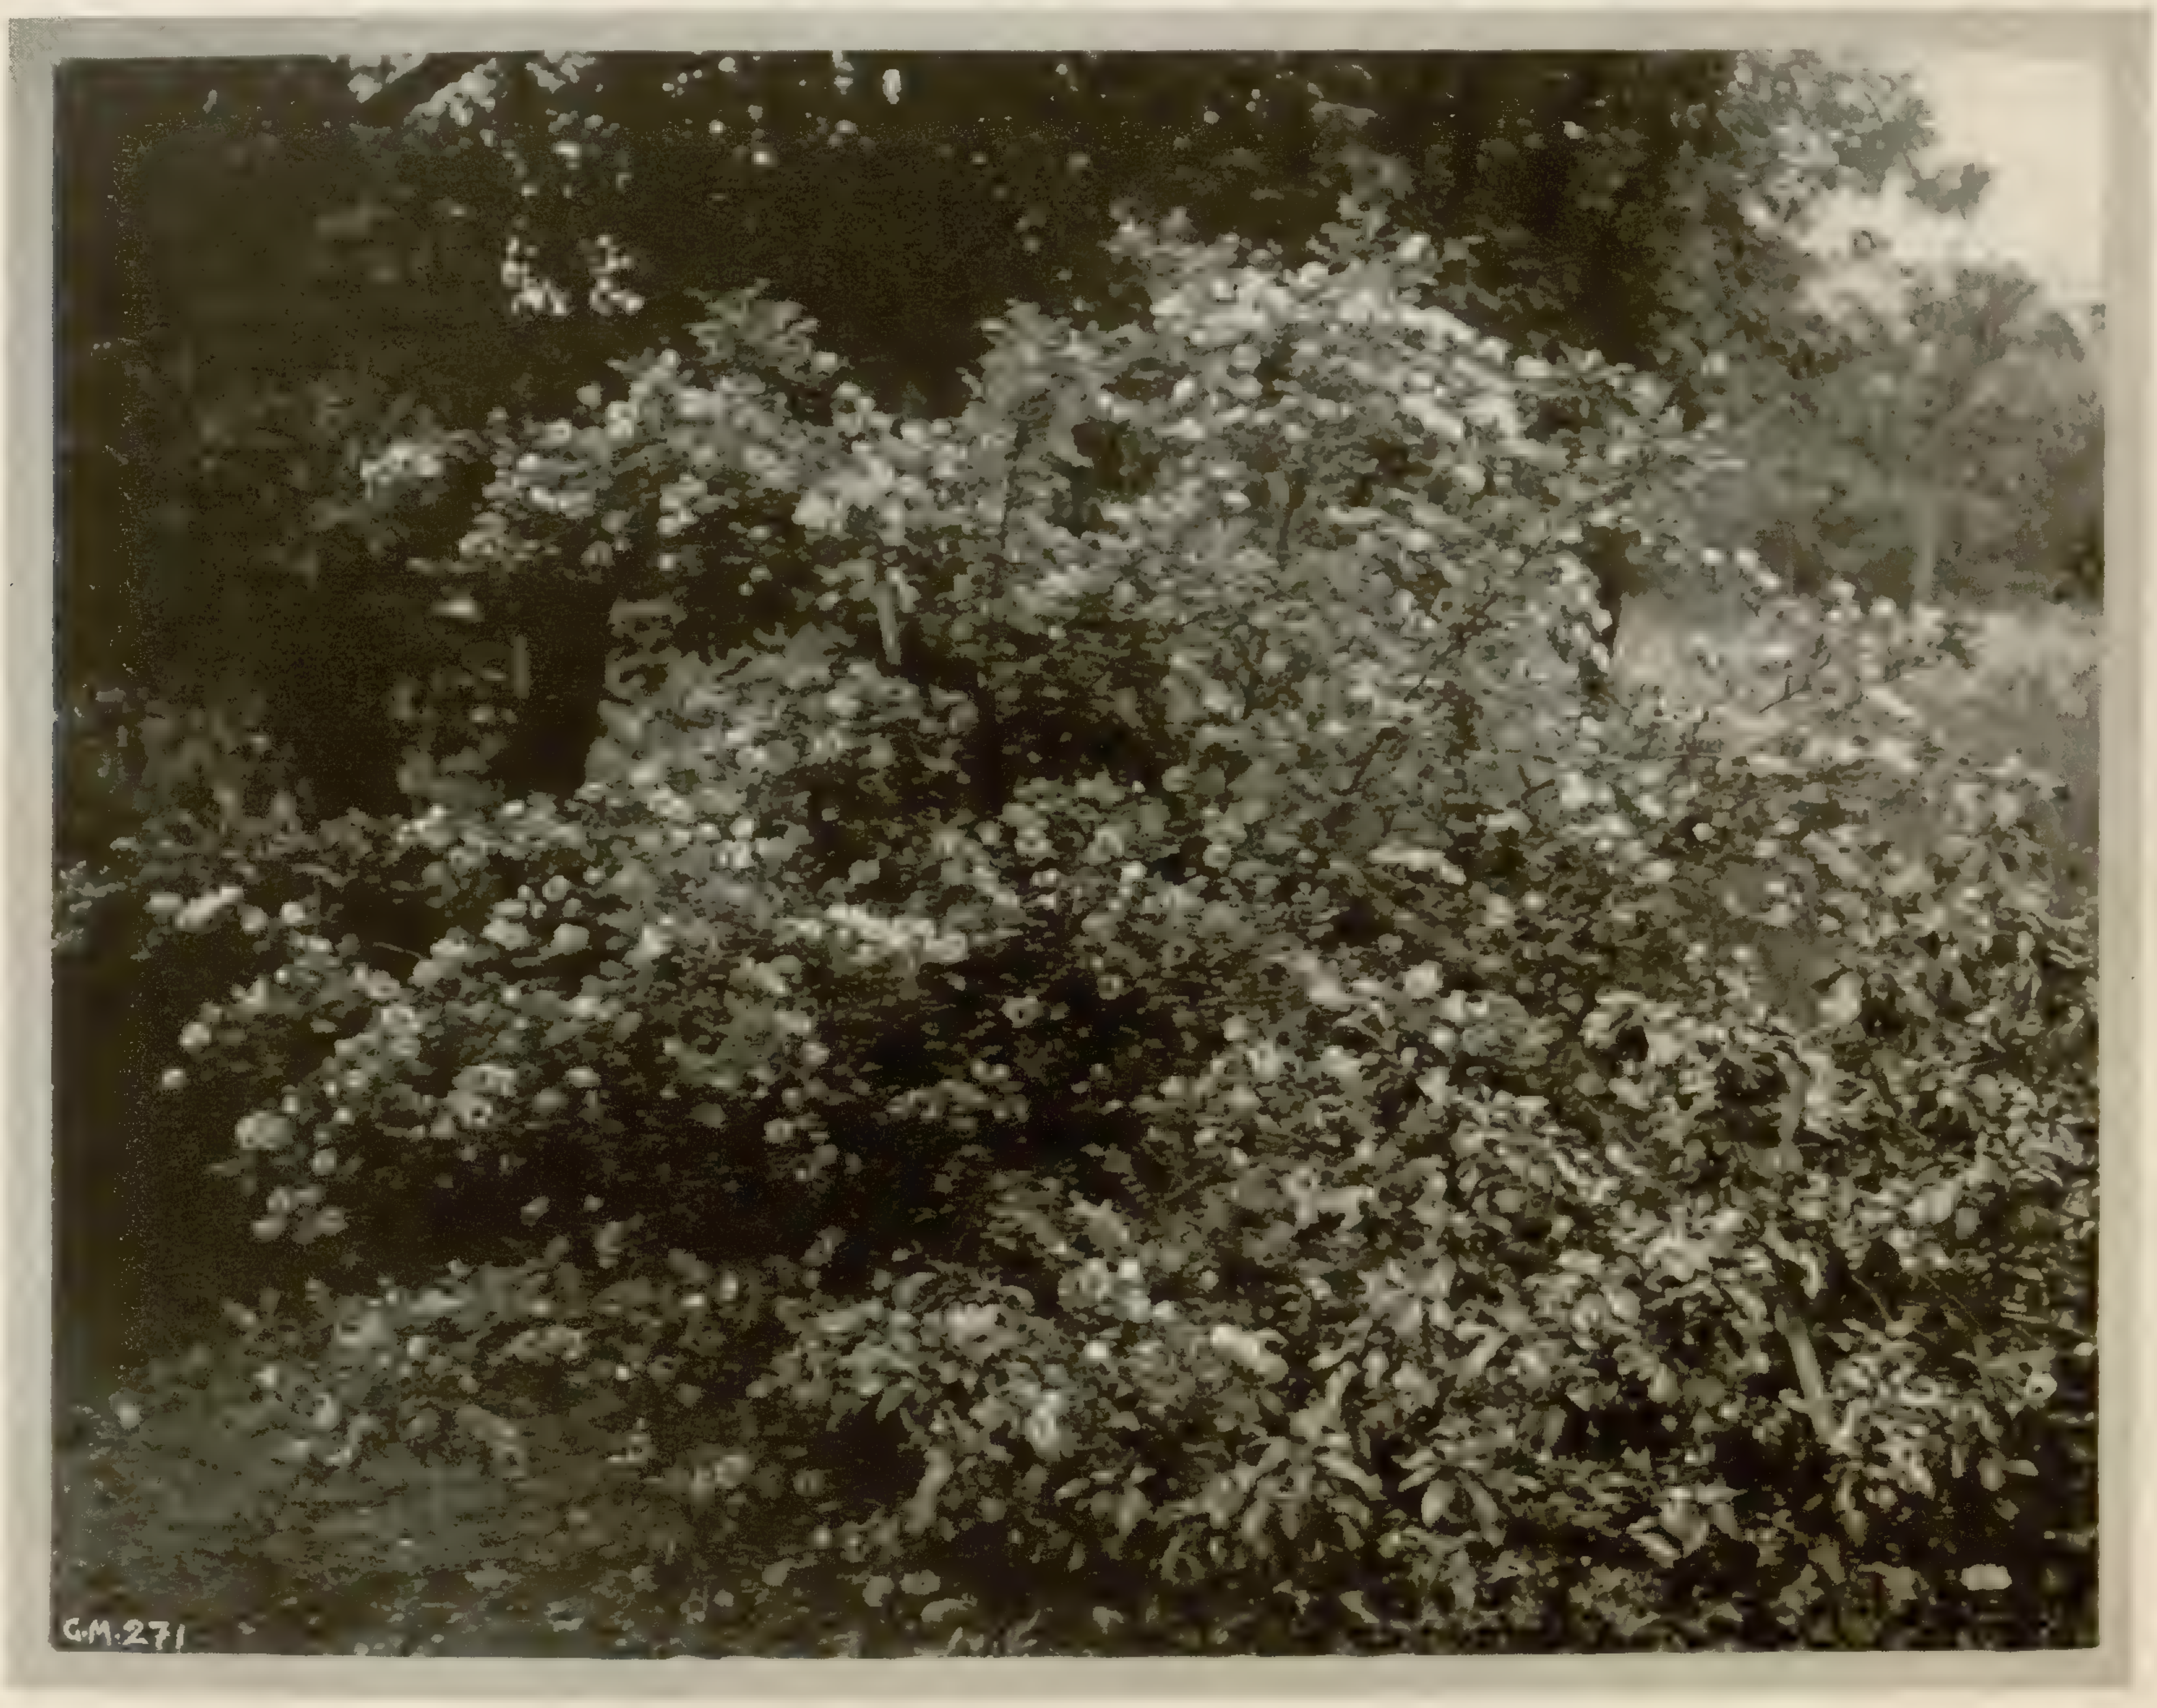
Alger Petts.

HARDY FLOWERS are always popular, as they make the garden bright and attractive, and require but little attention. All the information required for their successful culture is given in Easily Grown Hardy Perennials, by G. H. Vos. Price 5s. net, by post in box, 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

ROSA HUGONIS.

While enthusiasm for good garden roses grows stronger from year to year, there are many who are growing impatient of the ordinary garden forms, and are taking up the cultivation of many of the species. There are such a large number of beautiful species to make a selection from now, that this is little to be wondered at, as many of them fulfil all the requirements of a good garden rose. One of the finest species for decorative effect, and one of the latest introductions, is the lovely species depicted in the accompanying illustration. This free-flowering rose was raised at Kew from seed received in 1899, which had been collected in Western China by Father Hugh Scallan, who sent it to the British Museum, from whence it was sent to Kew. Its habit, spines, and structure of the flowers show it to be a near ally of the British Rosa spinosissima. The flowers are light yellow in colour, two inches in diameter, produced in profusion all over the bush in the month of June. The largest bushes at Kew are now about five feet high, but as these are still comparatively young, they will probably reach much larger dimensions.

C. P. Raffill.



ROSA HUGONIS AT KEW.
A new species with light-yellow flowers.

Planting Vines Outdoors for Foliage.—Vine leaves are such great favourites for dressing the dessert dishes in some places that there is a positive danger of unduly denuding the vines unless some means are taken to meet the supply. This is best done by putting in a few "eyes" of some of the cut-leaved vines which colour well in autumn, like Mrs. Pince. When growing well in five-inch pots the vines should be planted at the foot of an old wall.—E. J. K.

NEW PLANTS, ETC.

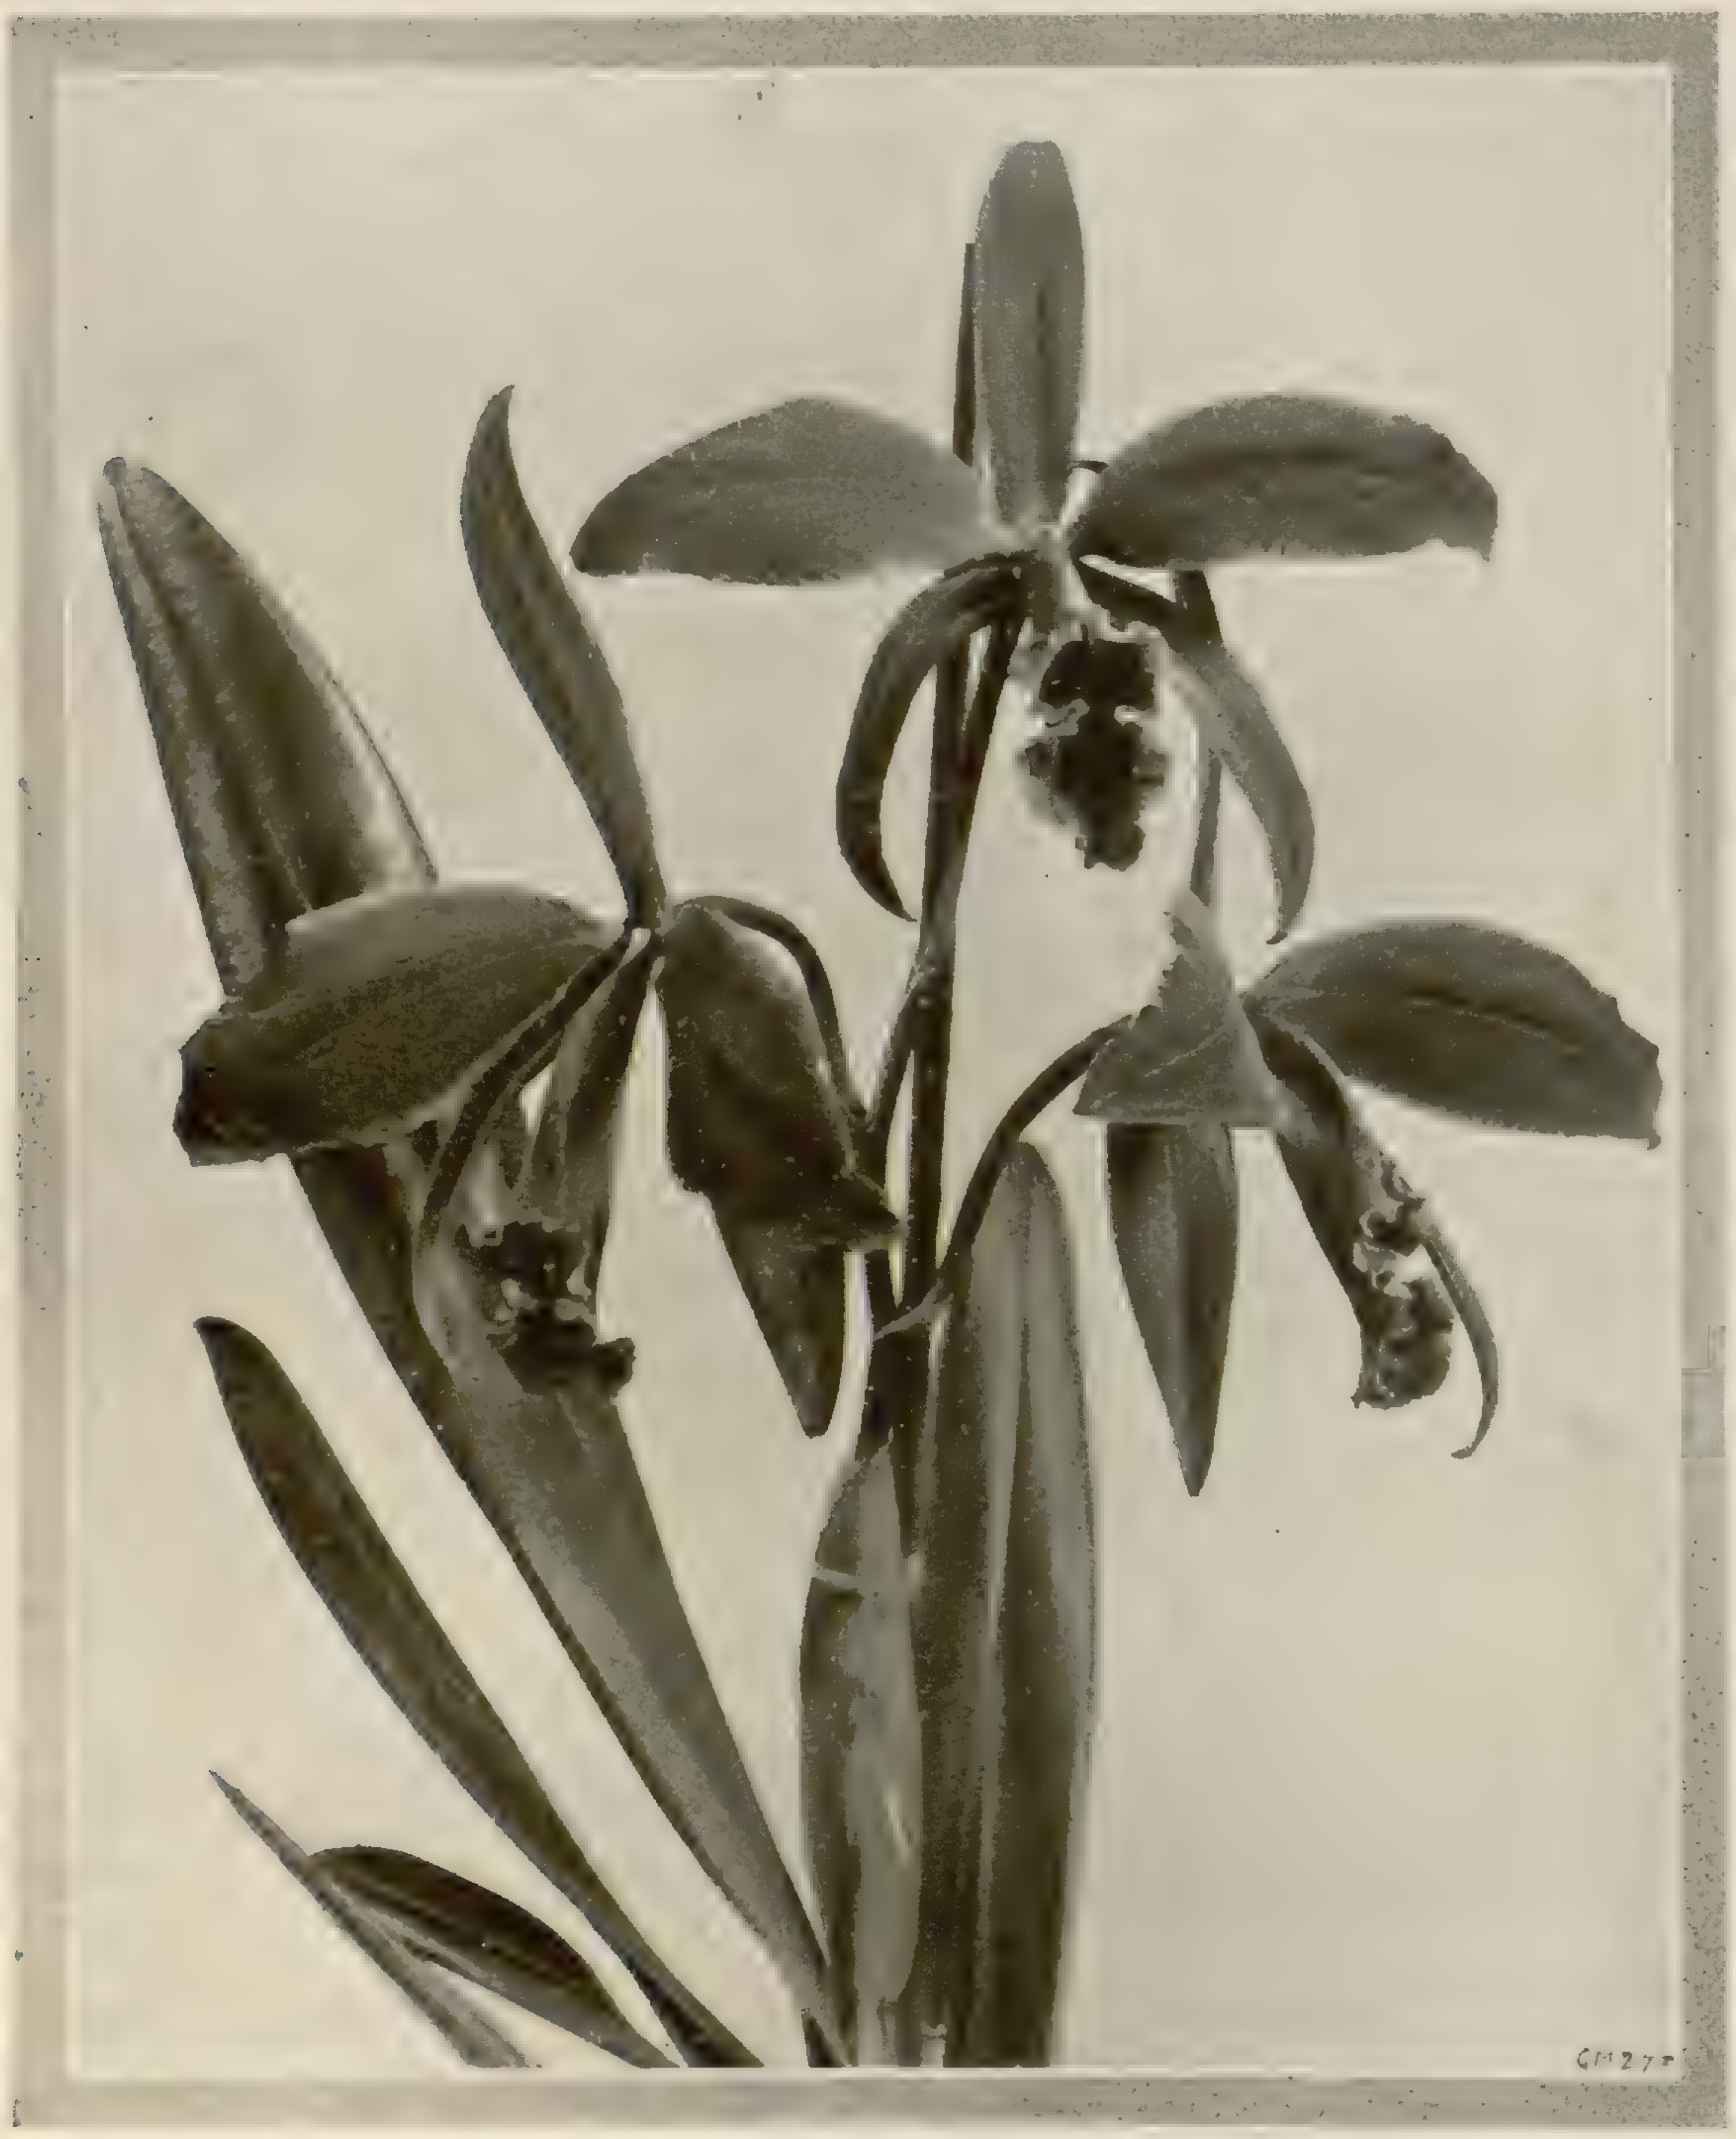
◆

VANDA SUAVIS PALLIDA.

A noble orchid, bearing a pair of fine spikes, one of these carrying a dozen large substantial flowers. It is an albino form, the flowers being white, tinged with greenish-buff. Some orchid experts regard it as closely approximating to Vanda suavis Sanderæ. F.C.C., R.H.S., March 17. Mons. Theodore Pauwels, Meirlebeke, Ghent, Belgium.

LÆLIO-CATTLEYA ELINOR.

A very beautiful hybrid, derived from Lælia Coronet and Cattleya Schroderæ. It has fairly large flowers, that are of a most brilliant orange-yellow colour, and glisten in a charming manner. The plant carried three flowers, and provided a most attractive bit of colouring. The plant has now, we understand, passed into Major Holford's collection, at Westonbirt. A.M., R.H.S., March 17. Messrs. Charlesworth and Co., Heaton, Bradford.



LÆLIO-CATTLEYA ELINOR.

Flowers rich orange-yellow. A.M., R.H.S., March 17, Messrs. Charlesworth and Co., Heaton, Bradford.

CATTLEYA SUZANNE HYE DE CROM.

A very fine and beautiful cattleya that was extensively shown on March 3, but as cut flowers only were forthcoming no award was then made. On this occasion a flowering plant was exhibited. This lovely cattleya is a hybrid from C. Mossiæ Wagneri and C. Gaskelliana alba. The flowers are large, pure white, and with a yellow throat to the frilled lip. F.C.C., R.H.S., March 17. Mons. Jules Hye de Crom, Coupure, Ghent.

LÆLIO-CATTLEYA LUMINOSA WESTONBIRT VAR.

This is by far the finest variety we have seen of the hybrid from Lælia tenebrosa and Cattleya Dowiana aurea. It has very large, broad-petalled flowers, that are of a deep orange hue, tinged with bright carmine-red, and have each a fine deep purple lip. A.M., R.H.S., March 17. Mr. H. Alexander, orchid grower to Major Holford, Westonbirt, Gloucester.

CATTLEYA ENID, WESTONBIRT VAR.

A very bold, large-flowered form of the handsome hybrid between C. Warscewiczi and C. Mossiæ. It has bright rosy-purple flowers, and a pale margined, deep ruby-purple lip. A.M., R.H.S., March 17. Major Holford, Westonbirt.

ODONTOGLOSSUM GLADYS.

A charming and very distinct hybrid, derived from O. cirrhosum and O. Harryanum. In form of spike and shape of flower the newcomer most resembles O. cirrhosum, and for once in a way the influence of O. Harryanum is not predominant. The ground colour is white, tinged with yellowish-green, and on this is a rich suffusion of dark, yet bright, purple. A.M., R.H.S., March 17. Messrs. Charlesworth and Co., Heaton, Bradford.

GARDEN SEATS.—II.

One point which ranks equally in importance with the disposal of our garden seats is the nature and build of the same, and here, as in all garden architecture, must our goal be harmony, utility, and durability, for, if we attain not these, it were indeed better that we should walk our gardens with no opportunity of rest. Of all garden horrors there are none worse than inartistic and trivially-designed seats. How well do we not know that terrible "rustic seat," a thing composed of curved ends of branches, often brightly varnished, and overlaid with yet more pieces of wood distributed in patterns of diamonds, triangles, squares, and various fearful and wonderful designs abhorrent to the artistic eye, and still more disagreeable to the back rash enough to lean against them. Such an object is entirely out of place in art, and has a paltry, jerry-built effect that renders it an object of contempt.

Garden seats should necessarily harmonise with the garden itself, and there are so many beautiful models obtainable, and even genuine old designs at times to be found, that there should be no difficulty in making our places of rest among the most attractive of the garden delights. There are many opportunities for stone seats in the Italian style of gardening, and these, or those of heavy oak of simple design, look equally well in an Elizabethan or formal old-fashioned pleasaunce. In angles of walls, on each side of a stone gateway, under terraces, and in various nooks and corners of garden architecture, the wide stone seat or bench, with its paved surrounding floor, and comfortable back and arms, whether built into the masonry, or subsequently placed in its shelter, is at all times a thing of great value and attractiveness. Garden chairs should be of as simple and strong a build as possible, and, if they must be painted or stained, the colour should be one that is not unduly noticeable, a dark green, for instance, harmonising well with the surrounding foliage, while the silver-grey tones taken by old oak, after lengthened exposure to the weather, are often very beautiful, and are, doubtless, among the most pleasing from an artistic point of view, particularly in woodland scenery.

A great point to be remembered in the disposal of seats in a garden is, that there should be one for every emergency, one where the sitter may be sure of sun in the winter, one for shade, one for shelter from prevailing winds, another for retirement and peace, or for a favourite view. If possible, the ground underneath the seat should be paved, or prepared in some way against damp and discomfort, it always being borne in mind that this preparation should be as carefully thought out as the seat itself, so that it may harmonise with it. Above all things, garden seats should appear an integral part of the garden, and should never suggest that they were merely afterthoughts.

A charming adjunct to any garden is the paved and sheltered space, not too far removed from the house, set with chairs and tables, where meals can be served in comfort, provided it be fine overhead. Such a retreat may be protected by the rear foliaged branches of the trees and by the old grey wall that guards the sun-trap on the northern side. Here it is dry underfoot, the perfume and the sweet air of the garden is present, the distant landscape charms the eye, and the singing of the birds, grown tame with the hospitality of the house, may be enjoyed through the pleasant hours of the early summer evenings.

S. W. Fitzherbert.

PLANTS IN TUBS FOR TERRACES.

◆

Ivy-leaved Pelargoniums.

In many gardens the use of plants in tubs, when in quantity and of sufficient quality to claim admiration, add a distinct and telling charm to the surroundings. And the material well adapted for this purpose is ever increasing. Yet, after trying considerable numbers and varieties of plants I have found nothing to claim such general admiration as well grown specimens of the ivy-leaved pelargonium Madame Crousse, the pale pink flowers of this variety are produced in abundance, and the fine habit and vigorous growth are all that need be desired; Souvenir de Charles Turner is of similar habit and vigour, but the rich red flowers of this variety are less popular.

In the accompanying illustration six plants of the first named variety are shown, each about nine feet in height, and from four to five feet in diameter; they are grown in cut petrol casks in compost suitable for free growth. Iron rods of the desired height, connected at the top, are made so as to clasp the tubs round the mouth, and covered with a wide-meshed wire netting, over which the plants are trained. The cultivation and management is simple in the extreme. Eighteen months from the cutting will suffice to secure such plants as represented.

Agapanthuses.

It will be noticed that between every two plants of the pelargonium is one of the African lily (Agapanthus umbellatus). This plant has leathery, strap-shaped, bright green leaves two feet in length, and spikes three feet high carrying large heads of bright blue flowers. These make fine companions for the Madame Crousse pelargonium when grown in tubs, in these they will grow and flourish year after year with little attention if given plenty of water during the summer months, and the protection of an unheated house or pit during the winter months.

Aloysia citriodora.

This well-known plant, commonly called the Lemon-scented Verbena, is also well suited for tubs, and is remarkable for its delightful fragrance when the leaves or branches are handled. We have just now been pruning some plants which stand about twelve feet in height, and something like eight feet in circumference. After pruning (and it is remarkable how the dried leaves and prunings retain the delightful odour) this subject is easily increased by cuttings when placed in gentle heat. When in bloom during the summer the aloysia is very conspicuous and with its whitish or pale lilac flowers on long slender spikes, borne in great profusion, it somewhat resembles the tamarisk. It requires the protection of an unheated house or shed during winter.

Fuchsias.

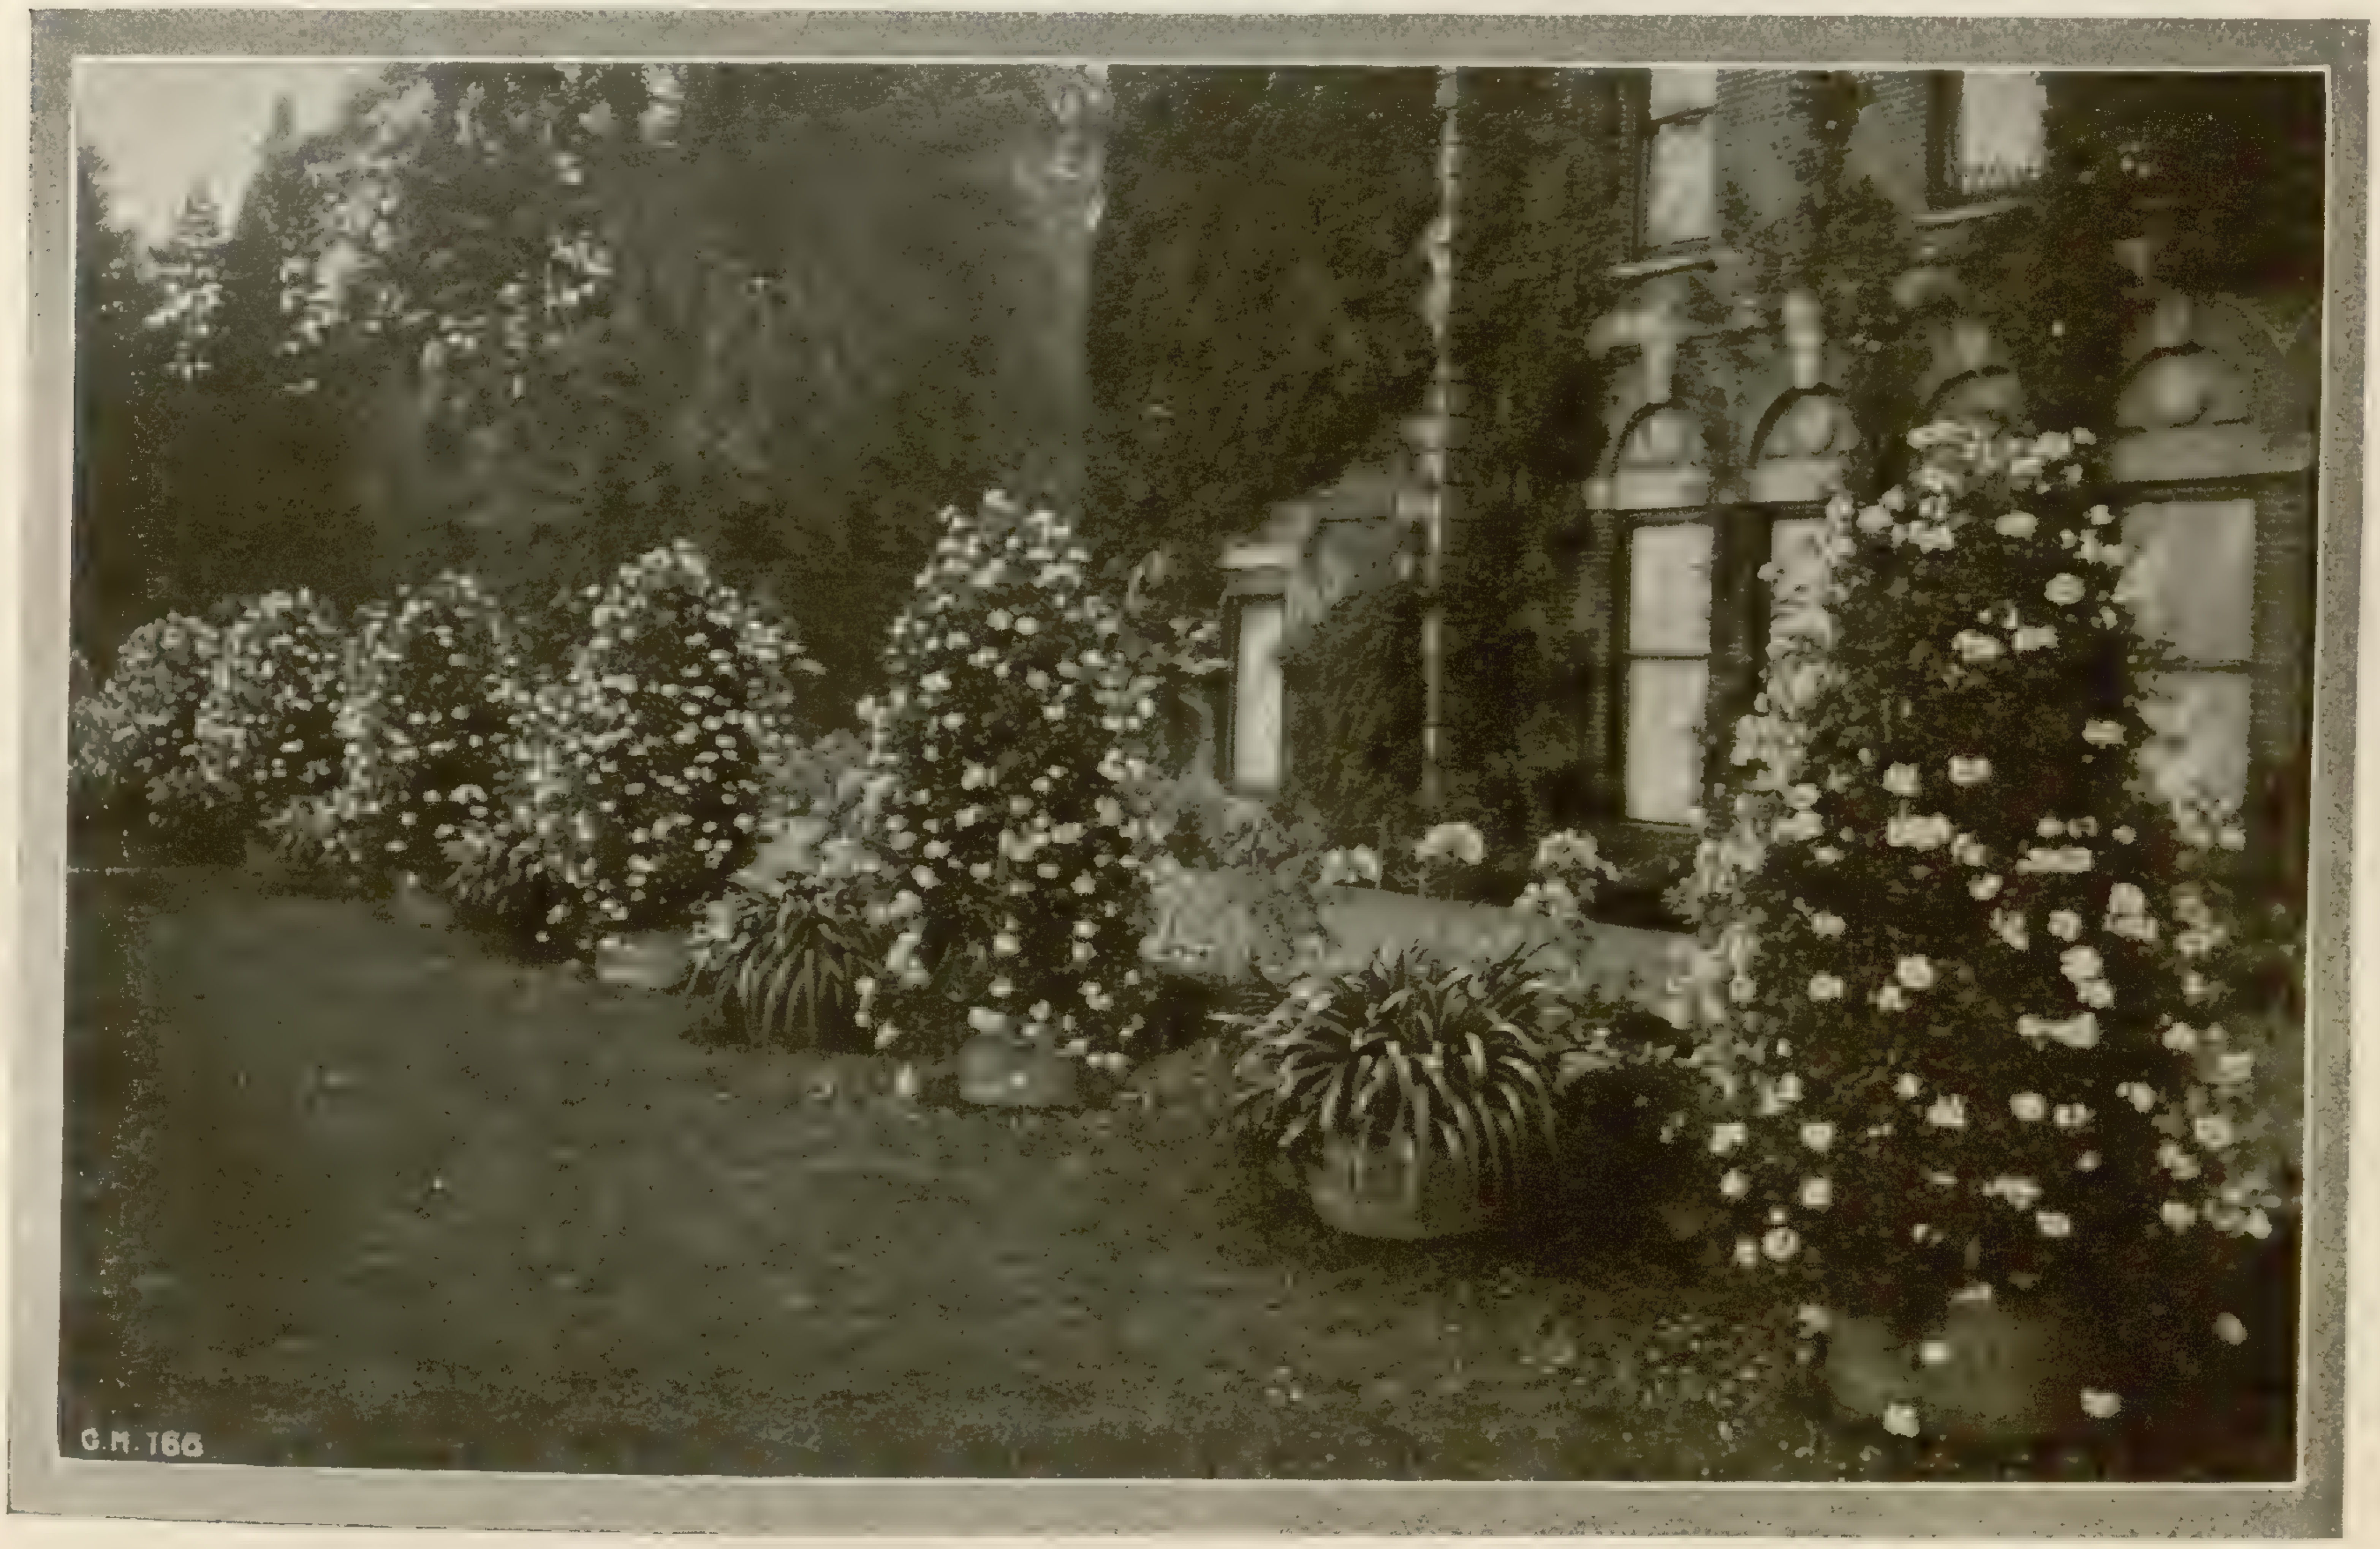
When well grown these make handsome plants for tubs, and it is surprising that they are so seldom used for this purpose. Many of the hardier varieties are fine when grown in good, rich, sandy loam and leaf-soil, and well supplied with water during the growing season; they require but slight protection during the winter, and they will go for weeks without a drop of water at that season.

Sweet Peas.

During late years the sweet pea has become such a popular favourite, the varieties so numerous, and cultivation so well and generally understood, that it is scarcely necessary to remind readers that for tubs it is a charming subject. I have grown sweet peas in this way for a number of years with the greatest success. The plants attain a height of from ten to twelve feet, and it is therefore sometimes difficult to find suitable positions in which to grow them in close proximity to the mansion where their delightful fragrance is so highly appreciated, but when tubs are used this difficulty is overcome and the plants flower profusely when given liberal treatment. All faded flowers must be removed so as to prevent the development of seed pods. The variety Miss Wilmott is much appreciated for table decoration, and when the tubs are placed on the north side of the mansion the charming colour is retained and flowering is in no way affected. The everlasting sweet pea is also a fine subject for tubs.

W. FYFE.

Lockinge Gardens.



IVY-LEAVED PELARGONIUMS, MDME. CROUSSE, AND AGAPANTHUSES, GROWN IN TUBS AT LOCKINGE PARK, WANTAGE, THE RESIDENCE OF LADY WANTAGE.

Iris Heldreichi.—The correct title of this iris is I. stenophylla, under which name it won a First Class Certificate at one of the Royal Horticultural Society's exhibitions. It is certainly one of the loveliest, as well as one of the easiest, to grow of all the bulbous irises, and is a very free bloomer. The flowers are four inches across, and are borne on stems four inches in height. As with so many of its race, there is considerable variation in the flowers of collected bulbs, and, where a number are in bloom simultaneously, a certain divergence in tint between the different flowers is clearly noticeable. In the three dozen now expanded on a warm south border many varieties of tint occur. Perhaps the handsomest form has violet-purple falls, delicately reticulated with white around the central yellow band, and purple standards. Some have lavender falls, and others purple-blue, the falls in each case being terminated with a violet blotch. The flowers are deliciously scented, and, in fine weather, last fresh for many days.—S. W. FITZHERBERT.

THE DRAINAGE OF ROCKERIES.

Among the many errors to be met with in examining rockeries in different parts of the United Kingdom, that of imperfect or improper drainage is noticeable, although not so common as some other mistakes of practice which are to be found in one's garden peregrinations. It seems, however, desirable to draw attention to this subject for the benefit of the many who are contemplating the construction of new rockwork, as well as for those who are suffering from the neglect of this requisite for all alpine flowers.

This evil of imperfect drainage is seen sometimes in rock gardens constructed of artificial material, such as those built of concrete, erected in situ, and without proper provision for the escape of surplus water. One has seen such rock gardens formed without egress for the water from the pockets provided for the plants, with the result that in wet weather their roots were in saturated soil, which, if long in this state, became soured and injurious to the plants it was intended to support.

In a lesser degree this has been seen in rockeries built with blocks of stone, laid too closely together to permit of the free escape of the surplus moisture, however well the structure looked to the eye.

Still another defect in the way of insufficient drainage has been met with, i.e., that of a rockery built on stiff clay, with only a surfacing of good soil, and even the clay heaped in such a fashion that the water did not run off it freely after passing through the surface soil, but collected in hollows, which became soured with the constant standing water.

Yet another defective system of drainage consists in its being too free and open,as is found in rockeries made up of loose stones or rubbish without the interstices being filled with light earth, which will fill up the cavities between the stones. The result of this is that the soil above is too dry, and that the roots of the deep-rooting flowers pass into air spaces instead of penetrating soil among the stones. Hence the failure of some deep-rooting plants in certain rock gardens and rockeries.

It may be said with confidence that few of these defects are to be found in rockeries made by expert professionals,most of whom now turn out excellent work in every way, although they are seen in the case of those formed both by amateurs and gardeners, especially among the former, many of whom have but the slightest knowledge of the needs of plants —a fact not surprising in view of the few opportunities they have had for gaining experience.

This discussion of these errors naturally leads to some hints as to how they may be avoided, but these need not occupy much space, seeing that the exposure of the mistakes naturally shows how to avoid them.

Artificial rockeries composed of concrete and other material of the kind should have the "pockets," or places in which the plants are to be inserted, with some through communication at the bottom, either into free soil beneath or to the front, so that any surplus water may escape. Each pocket is practically a flower pot, and its drainage should have the same attention as that we bestow upon these receptacles for the greenhouse or window. It need not necessarily be composed of crocks, as small stones will do quite well, but I advocate putting some light and porous soil among this drainage so that the roots may find access to it.

If well done there is little fear of choking up the drainage.

For the rockery composed of a mound of soil, or a series of mounds, the drainage may be more easily planned and carried out. A good layer, a foot or so thick, of stones or broken bricks, filled between with light sandy soil, with some peat or leaf-soil among it, will do wonders in maintaining the soil above in a fit condition, provided always that its exterior is not sealed up by other material which will prevent the egress of the water.

The depth of the soil above for the plants themselves, and, in consequence, the position of the drainage, depends upon the nature of the upper soil. If light, the drainage may be more than a foot down: if heavy, about a foot is as much as it ought to be in thickness.

Yet, after all, the best method to follow for those who have a supply of good material at hand, is to form the whole body of the rockery of a free, open soil, of such a kind that water will freely percolate through it, and then to make up the compost for the plants to suit them, assured that the drainage will be in perfect order. With this, and the firm planting so essential to success with alpine flowers, the rock garden will be a home indeed for the best of the flowers we seek to enjoy.

S. Arnott.

CARNATION NOTES.

Still we have to chronicle progress. The carnations, especially those of the perpetual type, seem to abound with new interest, and are making great strides in popular favour.

The notes on "Perpetual Carnations for Private Gardens" in the Gardeners' Magazine of March 7, pretty well cover the ground as regards cultivation and varieties for general use, but still one can find much to say regarding these useful favourites.

We are still weighing varieties in the balance, and some of the older varieties are gradually slipping down the scale, while new varieties are ever arising to compete for their places. One may give a few brief notes regarding those which are of sufficient merit to warrant a good trial by English growers, as soon as they are available.

The new crimson Harvard, which has been on trial for the past four years, is accredited with being a cross between the handsome Prosperity and the free-flowering General Maceo. The size of the former has been retained in Harvard, while it has followed General Maceo in freedom and quick growth. The flowers are three and a-half inches in diameter, of good form, and with a stout calyx; they travel well and keep splendidly. In addition to this, it is early, with long stems, and, like the valued Harlowarden, every shoot goes away to flower. If its good qualities are as pronounced in British hands, it will be a most valuable acquisition.

A new white variety which will doubtless come to the front rank when it is put on the market, is Georgia. It is regarded as an ideal white, being extremely productive, of grand size, and of fine form, in addition to being very fragrant. By the way, My Maryland, a recent comer, was splendidly shown a few days ago at the Royal Horticultural Society, eclipsing such famed sorts as White Perfection, etc. Growers should make a note of this variety, whether they are engaged in private or trade work. Another new variety is Faust, a very bright scarlet; it is rather lighter in growth than Victory, more free in blossom, with good long stems. It comes into flower early, and will give a good crop of blossom at Christmas, the calyx is good, and it is of medium size.

Speaking of Victory, there is a point of interest which requires clearing up. Mr. Slade omits it from his list of scarlets, and gives St. Louis, which is regarded by many as synonymous with Victory. Whether the same variety exists under the two names I cannot say, having only grown the form known as Victory, and not St. Louis. Perhaps some other grower can settle this point.

Many will be interested in the parentage of a new variety which was shown at the recent Carnation Show. The variety in question, Rosa Homewood, raised by a Thames Valley grower, failed to gain the coveted Award of Merit, but its taking colour attracted attention, and doubtless more will be heard of it. The parents of the newcomer were Duchess of Fife and Miss Joliffe, and it has the colouring and form of the Duchess, with the "tree habit" of the latter. It is certainly a most floriferous variety, as the raiser has fully proved, a house of it being a perfect mass of buds and blossoms. Had it been of larger size, it would have made a good exhibition variety, but for cut-flower work it should prove valuable, especially as the Duchess of Fife colour is so popular for bouquets, etc.

Yellow varieties are not as yet over plentiful, neither does there seem any great demand for them, but at the same time a few yellows will enrich a private collection, and add considerably to the range of colourings. In addition to those charming fancies of Mr. H. Burnett's, such as Ceres and Aurora (which I have noticed in a previous article, and which are deserving of wide-spread cultivation), there is the bright clear yellow Eldorado, which is of medium size, with good habit, and free-flowering. Golden Eagle, a good rich yellow, has a decided pink picotee edge, the blossoms are of large size, and produced on long stems. The soft lemon-yellow Golden Beauty, the flowers of which are lightly tipped with pink, is a strong-growing variety, with long, stiff stems. The blossoms are of grand size, with high, full centres. Mayor Pingree is somewhat similar in colour, but not quite so large in the flower, and the petals are occasionally flecked with white. The English-raised Mrs. Arthur Walkington, one of the best of Messrs. W. Cutbush and Son's seedlings, is a good profitable yellow, being deep in colour, of fair size, with good stems, and very free, and it is recommended for winter flowering. Gold Nugget is a robust, early, and continuous yellow. It is generally faintly marked with red, and provides a goodly number of medium-sized, well-built blossoms, which keep and travel well. There is also a yellow variety under the name of Victory; it is deep in hue, of good substance, and heavily marked with crimson.

In closing may I briefly draw attention to the Hon. Gladys Fellowes, a beautiful coral red sport from Mrs. Lawson, which has been well shown of late? It partakes of all the good characteristics of its parent, and its pleasing colour will doubtless render it a favourite with many growers in private places.

P. S. Hayward.

SWEET PEAS TO PERFECTION.—The new work, Sweet Peas and their Cultivation for Home and Exhibition, by C. H. Curtis, hon. secretary, National Sweet Pea Society, contains full information as to the selection, planting, and general management of sweet peas. The price is 1s. net (by post, 1s. 2d.), or bound in cloth, 1s. 6d. (by post, 1s. 8d.), from W. H. and L. Collingridge, 148, Aldersgate Street, London.

PRIMULAS AT WORDSLEY.

For a long number of years Messrs. E. Webb and Sons, of Wordsley, Stourbridge, have given very close attention to the production of high-class primulas for winter and spring flowering. The firm has been careful to select and re-select the varieties they have raised, always bearing in mind that good habit and freedom of flowering are as essential as fine form and size of flower; indeed, are often of more importance. But the florists' ideal of a full, rounded flower, plain or frilled, with a well-defined eye, has never been lost sight of, and therefore the Wordsley primulas resulting from these years of care are extremely beautiful and useful.

Among the many choice varieties raised by Messrs. E. Webb and Sons, special mention must be made of Snow Queen, a charming white primula, producing splendid pyramids of large pure white substantial blooms; and Ruby Queen, of similar type, but having very dark foliage and bright richly-coloured flowers. These two varieties are among the latest of introductions, and they set a very high standard of excellence at which to aim in future. Exquisite is another fine variety, or rather, a fine strain, because there are several distinct colours, but in each case the plants are particularly robust and floriferous, and they raise their large pyramidal heads of frilled flowers well above the foliage; for general effect and usefulness the red and white Exquisite varieties can hardly be excelled. The crimson Firefly, the exquisitely beautiful pink Modesty, the bold purple-crimson Eclipse, the carmine-rose Rosy Morn, the deeply frilled white Avalanche, the pretty and distinct Blue Belle, the vivid Scarlet Emperor, the bright salmon-rose coloured Meteor, and the wonderfully pretty Purity, with its pale lemon eye on a pure white ground, are all varieties of the highest merit and unusual beauty.

At Wordsley the primulas are finely grown, and present a fine picture early in the year, and the accompanying illustration shows one of the houses filled with plants from which seed is to be saved.

HOUSE OF FINE SINGLE PRIMULAS GROWING FOR SEED AT MESSRS. E. WEBB AND SONS' NURSERIES, WORDSLEY, STOURBRIDGE.

ANNUAL ASTERS.

These flowers—the China asters—are general favourites with most people during the late summer months, and now that there are so many distinct classes and varieties a very fine display can be maintained with them for a considerable time. But to secure a long period of flowering sowings must be made at intervals and the earliest sowing must necessarily be made in a warm frame or low span-roofed house. To be successful with asters they must be grown on from the start to the flowering period without any check.

The sowings should be made in boxes in finely sifted loam, leaf-soil, and old hotbed or mushroom-bed manure. Sow the seeds on a level surface, and press them down with a flat block or board. The seeds must be sown thinly, because if sown thickly they may come up well only to damp off quickly, and then the seedsman is blamed. Cover the boxes with sheets of glass or sprinkle a little moss over the surface to prevent the top of the soil drying. When germination has commenced remove the covering.

As soon as the plants have become large enough prick them out into other boxes or on to a spent hotbed; give them plenty of room, and as soon as they have become established and are growing nicely the lights should be removed on fine days so that the plants become robust and hardened to the weather. Eventually plant them out in well dug and freely manured ground, for asters love good feeding and pay for liberal treatment.

Take care, when pressing the plant into the ground, that the stem is not damaged, especially should this be guarded against when removing the plants in their early stages, for disease will take off a plant in its prime when the stem has been bruised during its early existence.

For late displays a good sowing should be made in the open about the middle of April. The soil should be fine and rich. Plants raised from this sowing are fine for a September display, and often give a grand lot of flowers until cut down by frost. In very hot weather the ground in which they are planted should have a mulching before the plants become large. The plants must be afforded ample room for leaf development, and have stakes afforded in the case of taller growing varieties.

The best asters for decorative purposes are the Comet varieties, single and double, in blue, white, rose, and scarlet; Ostrich Feather, white, and with very long petals, sometimes seven or eight inches across the flower; and Plume Asters, in white, blue, and rose. These types are excellent border plants, and as subjects for cutting are much in request. Giant Singles, in pure white, pink, blue, etc., are excellent, they have long graceful petals and yellow centres. There are many other varieties—Victoria, Quilled, Pæony-flowered, Chrysanthemum-flowered, etc., which, however, are more useful for displays in the beds and borders than for cutting.

Leonardslee Gardens. W. A. Cook.

Shading Cinerarias and Primulas.—The first sunbeam with a real sting in it finds out if anything is amiss with the roots of these plants, and one can tell at a glance which have had an overdose of manure or too much water. But even the strongest plants feel the sun when it makes one of its characteristic bursts, and to save such from suffering it is wise to lower the blind until the glare goes off a little. Or, if the lowering of the blind is objected to on behalf of other plants, a few sheets of paper laid on those which are suffering most will suffice. Pink tissue paper is at once the lightest and best for this purpose, as its tint keeps out the strongest actinic rays of light.—E. J. K.

HOW TO FLOWER CLIVIAS TWICE A YEAR.

It may be of interest to many to know that by the method I am about to describe I have flowered clivias twice a year, namely, in October and at their usual period, without any apparent ill-effects upon the plants themselves, the blooms being as large and well-coloured on each occasion as when the specimens were allowed to flower but once a year, each cluster being a perfect bouquet in itself.

Repotting is done after the plants have finished flowering at their usual period, and large tubs or pots in which they are likely to be kept for a number of years are provided. Perfect drainage is afforded, and a good strong potting soil used. This latter may be made up of three parts fibrous loam and one part well-rotted manure, with sufficient powdered charcoal and sand to keep it open.

After flowering, leaf growth is stimulated by giving the plants extra warmth and supplying them with plenty of water and liquid manure. About the beginning of June they are given cooler quarters, with plenty of air, and during the last week in June they are stood outside, choosing a shady situation, as strong sunshine is injurious to the plants at any time of the year. Less water is given to ripen and rest the plants, but at the same time it is remembered that they are evergreen, have no true bulb, and that the leaves simply start from a root-stock, therefore they are never dried off sufficiently to cause the leaves to die.

About the first week in September the plants are placed in an airy greenhouse and given more water, and in about a fortnight they are placed in a house where a temperature of 60 degrees is maintained, giving them water as required. Flower stems will soon show, and after these have produced their blooms the plants are placed in a slightly lower temperature, and kept drier until about February, when they are removed to warmer quarters and gradually given more water.

In the case of a large plant left in a tub or pot for a number of years, it is necessary to renew the top soil annually, providing a good rich compost.

We grow both C. miniatum and C. nobilis; the latter has its segments tipped with green, and has smaller flowers than those of the above species, and these are pendulous instead of being erect.

Thomas Francis.

Bromley Cross, near Bolton.

Ivy should now be clipped or cut, and where there are large surfaces on walls a simple and quick way of cutting is to fix an old scythe blade on a straight handle four or five feet long, and cut upwards with it, a large surface can soon be cut, and if care is taken no damage is done to the ivy. Other evergreen trees and shrubs may now be clipped or cut over. Now is also a good time to plant climbers from pots; plant them in good, well prepared soil to induce vigorous growth from the start.—E. F. Hazelton.

Propagating Phloxes by Cuttings.—There is hardly a plant in the whole of the outdoor garden which pays better for propagating by cuttings than the late-flowering phlox. The result in well enriched and deeply dug ground is a revelation, the variety often being improved out of all knowledge. Cuttings should be made now of the young shoots round the outside of established plants; they may even be pulled off with a few roots attached. In any case, they soon make nice little stuff if placed singly in small pots in a cold frame. At planting time they should be set out in triangles of three, the plants one foot apart all ways.—E. J. K.

BEETLE REVELATIONS.

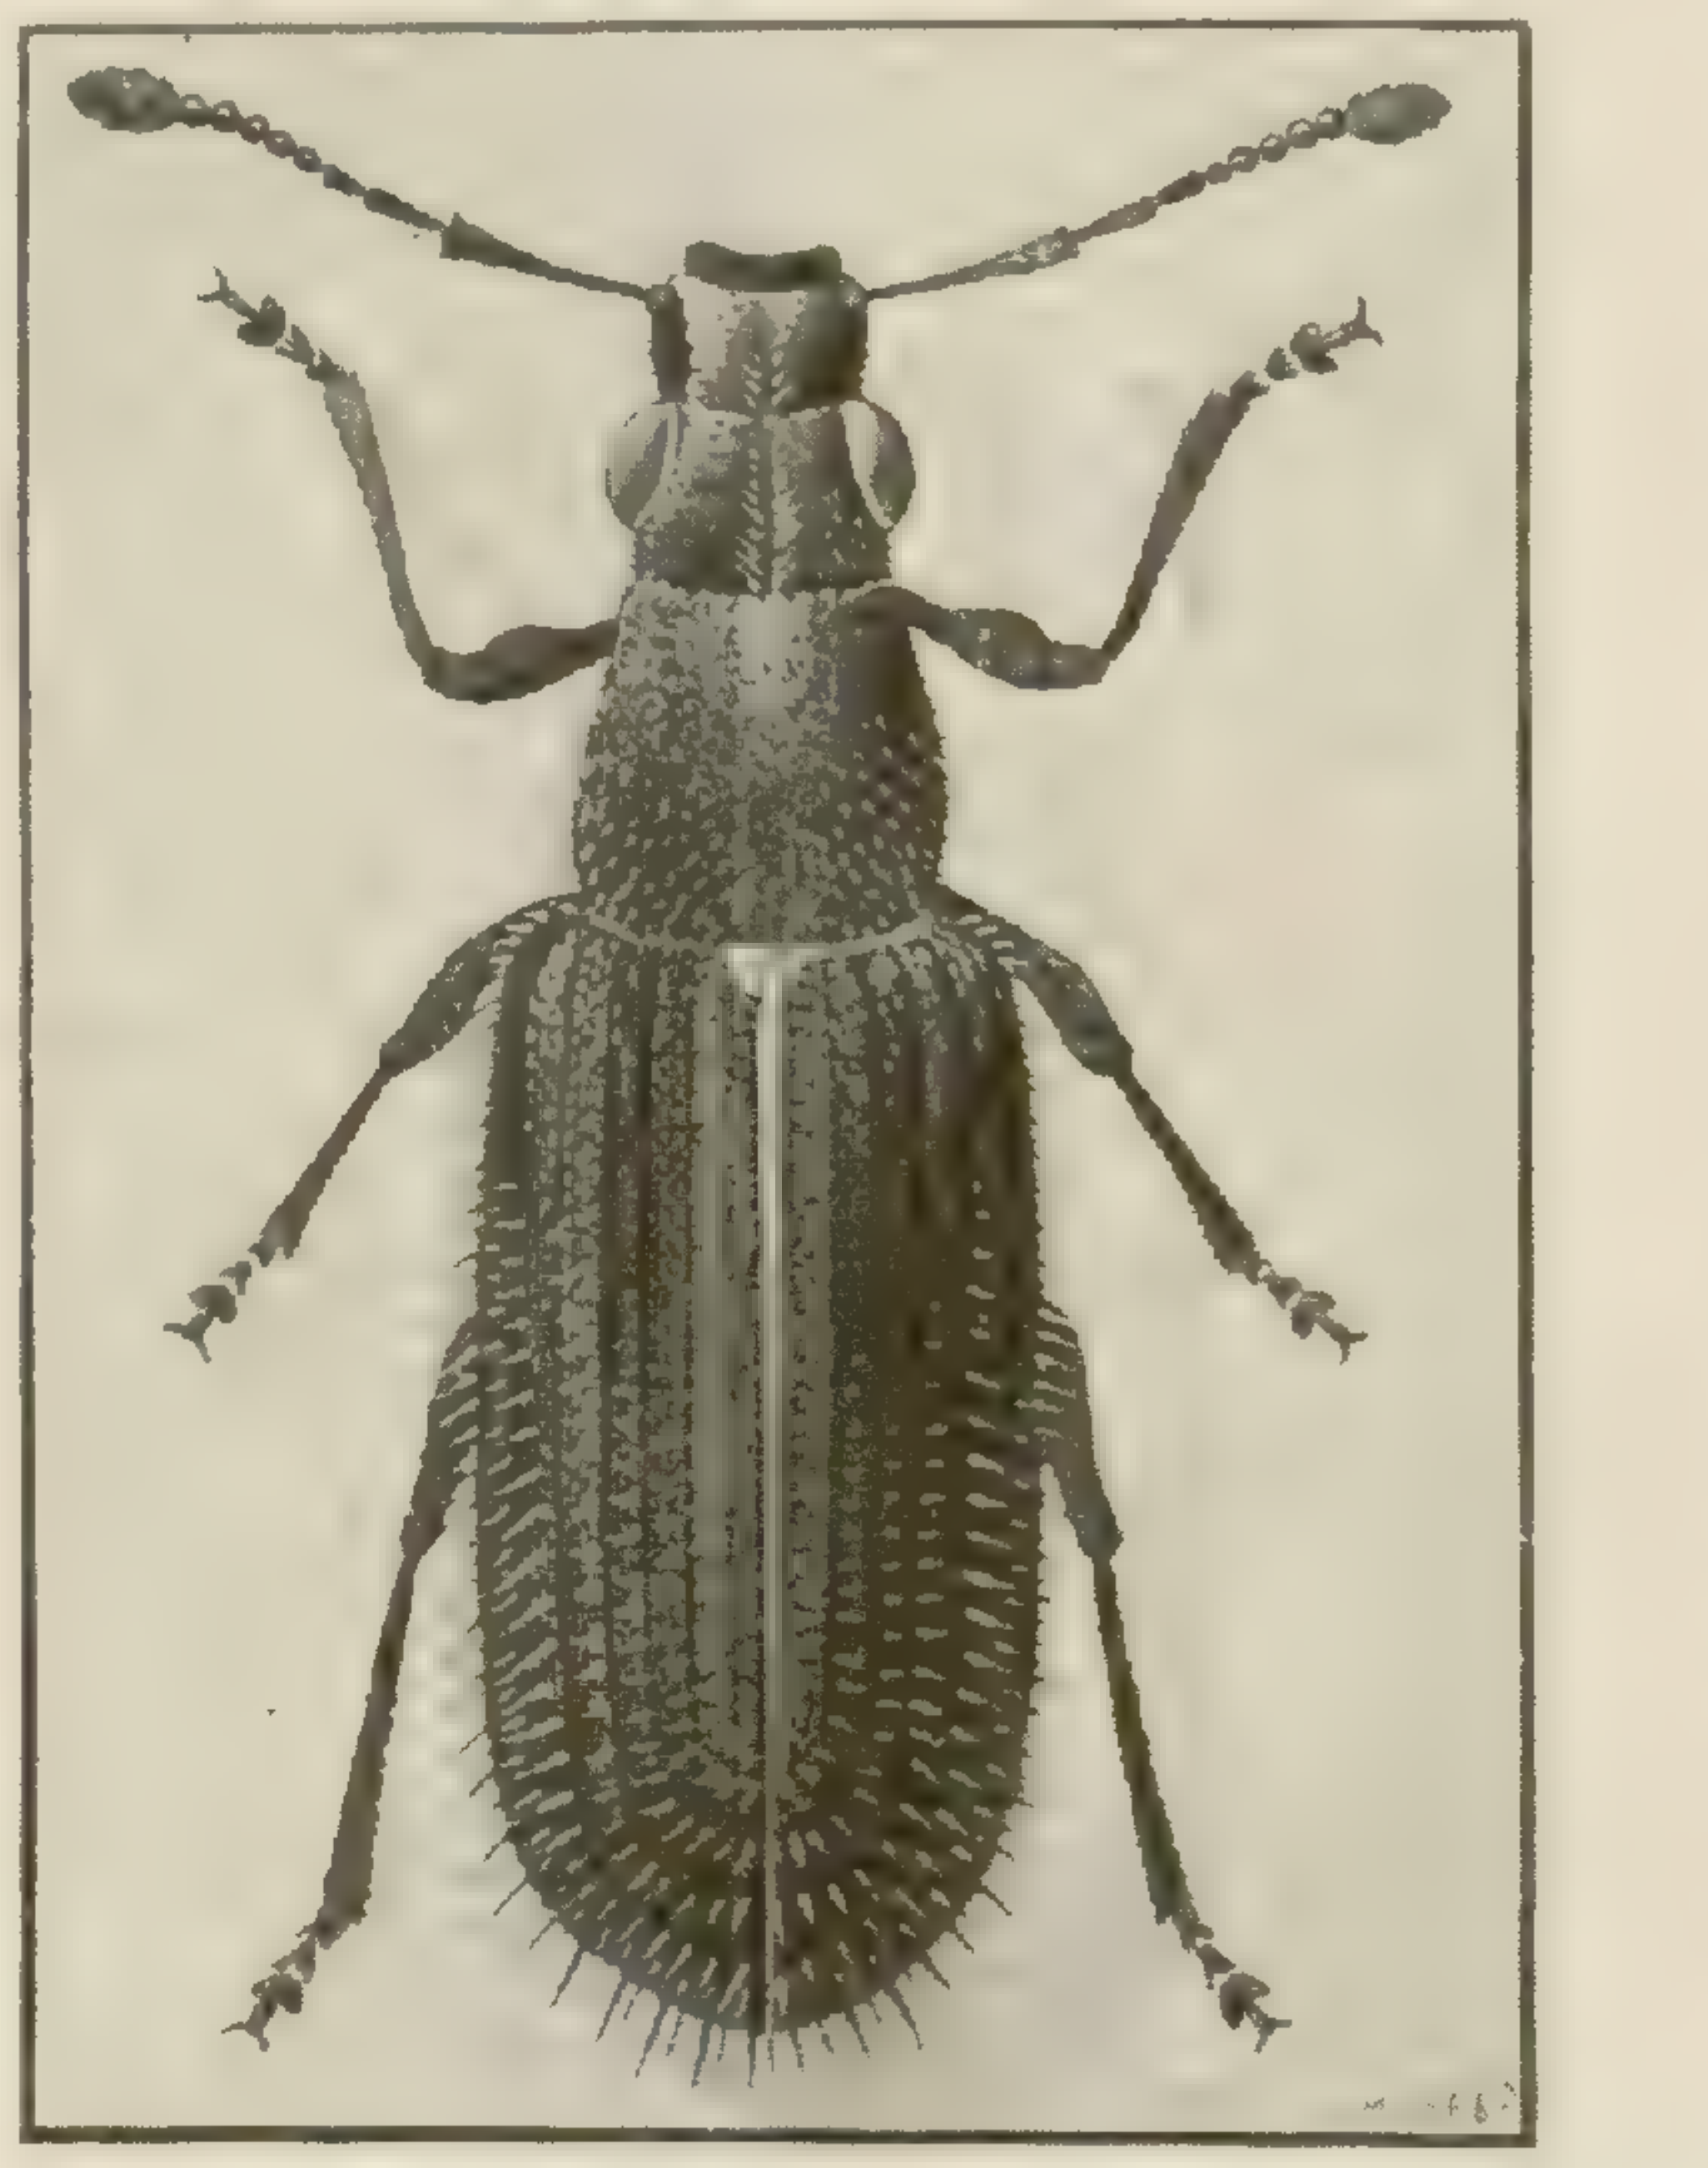
(Continued from page 166.)

◆

Pea and Bean Weevil.

The pea and bean weevils are exceptionally fond of all leguminous crops, among which peas, beans, and clover are included. They are especially troublesome to allotment holders and market gardeners, and when once they have obtained a complete habitation prove irremediable. Their grubs consume the roots, while they themselves feed upon the leaves, so that the attack is a very formidable and determined one. It is usual when an insect grub infests a plant, either in the ground or among the foliage, for it to give attention in its mature and perfect form to other kinds of vegetation. But here, as with the clay-coloured weevil, the case is different, and needs additional care in scrutiny and treatment.

The beetles themselves (belonging to the genus Sitonis) are about a fifth of an inch long, and greyish, with yellow lines along their backs, varying slightly in different species. They are nimble on the wing, and consequently enabled to quickly extend their operations. Gorse and broom prove attractions for them, so that readers who live near commons and heaths should be particularly on their guard against them. They share a deception practised by other beetles, inasmuch that when shaken to the ground they sham death, and their motionless bodies so closely harmonise with their surroundings as to be generally free from detection. When the weather is dull and dreary they become more lively, which is a trait only to be expected from night-loving insects.



PEA AND BEAN WEEVIL.

Although the damage they do is painfully evident, great notches being bitten out of the leaves, it is often attributed to slugs and sparrows, because of the concealing manœuvres of the insects. The beetles hibernate in barley ricks, stubble, and hedgerows, and come forth in the early spring to deposit their eggs just beneath the soil at the base of peas and beans. The grubs—white maggots really a quarter of an inch long when full grown—which hatch from them go direct to the roots, so that a weak solution of paraffin, if it could be used upon the ground before the grubs have found their way into the roots might prove useful, but once they manage to gain their quest it becomes next to impossible to dislodge them, since they mine channels along inside the roots, instead of fully consuming them. They live in the roots, not in the ground, a difference with a decided distinction.

Safeguards against their ascension as perfect beetles may be taken by solidly pressing the soil around the roots. Should they, however, gain access to the foliage the latter may be syringed with a mixture of soft soap and paraffin, or, as an alternative, lime or soot, either combined or separate, dusted over the leaves when the latter are wet could be adopted. Prolific manuring and close attention, so that the plants may, by strong growth, resist severe attacks are advisable to hasten the development of the pods. In this connection, the value of nitrogen bacteria-bearing compounds should be borne in mind, and tested. The grubs, or maggots, attain the perfect condition at about the end of May or beginning of June.

James Scott.

(To be continued.)

FORCING THE VEGETABLE MARROW.

The vegetable marrow is seldom recommended for forcing, nor is it, I think, except perhaps for the purpose of exhibiting, often grown under that condition. It is, nevertheless, more especially where great variety in the supply of vegetables is valued, well deserving of attention. When lately recommending it for forcing, I was asked the question, "what about its flavour?" and I replied that it was at least equal to that of forced dwarf beans, which are so commonly produced in private gardens, but in reference to this it may be said the marrows should be gathered while comparatively small, and be cooked whole, in which state the full flavour is preserved.

One reason, perhaps, why this vegetable is not more often forced, is from want of space to accommodate it, all the same it is not particular in this matter, and we have before now trained it in cordon fashion under rafters of houses containing dwarf beans, or similar subjects; but when grown in this manner plants must be placed sufficiently far apart to allow light for the crops beneath.

A suitable way of management is to sow seeds singly in small pots, and when the plants are well rooted shift them into six-inch ones, and later on finally place them in pots of twelve inches, or fifteen inches diameter. For the final potting loam, liberally mixed with broken horse droppings, forms a suitable compost, and this should be made tolerably firm in the pots. The plants are not very particular about temperature, and 60 degrees, if promoted by artificial means, will suffice. Water should be liberally supplied, particularly after the plants have become freely rooted, and while they are bearing fruit liquid manures may be advantageously afforded.

In the training of plants kept to one stem they should be stopped where they have reached the length of the rafters of the house allotted them, and their laterals be stopped at one leaf beyond the fruit and secured to the trellis; this treatment is all the more important if other subjects are growing beneath. It is advisable to [illegible] attend to fertilising the blossoms, for each blossom remains for a short time only in fit condition for this operation, and there is no certainty about the fruit swelling unless this is attended to. Owing to cordon trained plants remaining only for a comparatively short period in a bearing state, successional sowings should be made rather frequently.

The Hendre Gardens.

TUBEROUS BEGONIAS.

These useful summer and autumn flowering plants have been very popular for a long time both for conservatory and flower garden, for not only are they of easy culture, free flowering, and lasting, but their habit and varied colouring add to their worth. This class of begonias may be divided into four sections, i.e., singles having plain edged flowers, fringed or crisped forms, crested or feathered varieties, and the double forms. There has been a very marked improvement in all these of late, not so much in the size of their flowers as in their symmetry, together with good substance and a finer habit of plant. Growers, too, have become better acquainted with their cultivation, so that none but the best types are selected for the production of seed.

In a good habited plant the flower stalks should possess sufficient substance to carry the flowers well above the foliage and hold them in position without the aid of any supports, for nothing detracts so much from the beauty of plants of this class as staking, no matter how neatly the sticks may be inserted. In selecting plants then for the production of seed, only those that favour this habit should be chosen. There seems to be no difficulty in producing good habited plants both of the crimped edged and the plain forms, but the double and crested ones frequently either have not sufficient substance in the flower stalks to hold the blooms well up to view, or the stems are not long enough to carry the flowers well up above the foliage, and where this is the case all such plants should be discarded. Seed should be saved only from the finest strains and the most prolific bloomers.

Sowing the Seeds.

As a rule, unless special preparations are made early in January for raising the first batch of plants, they cannot be had of sufficient size to be of much service, therefore those who have not the convenience to raise an early lot would do well to fall back on one-year-old tubers, as they will give by far the least trouble. But where sufficient heat can be maintained from the beginning of the year onward to induce the seeds to germinate freely, and promote a healthy growth afterwards, with due care strong plants can be had by the end of June that will continue flowering until the autumn. As is generally known, the seed of the begonia is very small, and needs very careful handling. It should be sown thinly on the surface of the soil and shaded from the sun until the young seedlings appear. When in this small state careful watching is necessary to prevent the soil from either getting too dry or too wet, and no superfluous moisture must be allowed to hang about as the least drip from the roof often causes the plants to damp off.

As soon as the seedlings are large enough to handle they should be pricked off about half an inch apart in boxes or pans, the former being preferable, as they do not dry so quickly. A fine light rich soil should be selected, and this ought not to be pressed too firmly otherwise the roots cannot ramble so freely as they would in lighter soil. If a slight bottom heat of from seventy to seventy-five degrees can be maintained, with the house at sixty-five or seventy degrees, growth will be rapid, so that by the beginning of May the plants may be transferred to a mild hotbed made in a pit or frame. If planted out here about four inches apart each way in light rich soil, they will make sturdy growth. The plants will grow far more rapidly, and need much less attention if planted out than when grown in pots, and as they will be near the glass they will not become drawn, provided air is admitted on all favourable occasions.

As the plants come into bloom, and it can be seen which are the best, they may be lifted with good balls of earth and potted up for the greenhouse or conservatory, and if care be taken they will not receive any more check than follows when transferring them from one pot to another. It is, however, not every one who has the convenience to grow plants in this manner, therefore recourse must be had to other methods.

Tubers that are one year old do well for an early batch. These may be started into growth by placing them in shallow boxes covered with sifted leaf-soil any time from February to April, according to the period they are required to be at their best when in bloom. If the finest of the previous year's seedlings were selected when they were in flower there will be no difficulty in growing the requisite number of plants of each variety and colour, providing they were labelled in the autumn before the flowers faded. Plants started in boxes in this manner should be transferred to their flowering pots when they have made growths about three inches in length, and unless large specimens are required, pots six inches in diameter will be large enough, but where desired for exhibition purposes the plants may receive a shift into pots of larger size to induce them to grow more freely. As before stated a light rich soil should be provided, and where the loam is stiff, one part of leaf soil and one of decayed manure and one of loam forms a good compost, adding sufficient sand to keep the whole porous.

When the pots are filled with roots weak liquid manure may be given with advantage. The plants will need slight shade from bright sunshine, but the less of this the better for their well being, providing the foliage does not become scorched, and there is really not much danger of this if the houses are properly ventilated. When a too dense shade is given, neither the foliage or flowers are of good substance. Avoid a damp atmosphere in dull weather during the autumn as this has a tendency to cause the flowers to go off more rapidly than when a more buoyant, free, airy atmosphere is maintained. H. C. Prinsep.

Buxted Park Gardens.

Daphne indica.—In midwinter this lovely daphne flowers in the open in South Devon and Cornwall. There are two varieties, one bearing purplish-red flowers, and the other pure white blossoms tinged with crimson on the reverse. The latter, on account of its colour, is much to be preferred. The flowers of both are deliciously perfumed, and a single cluster will scent a room. It is no uncommon thing to cut twenty bloom-clusters in a single day from a good-sized bush. Some specimens in the south-west are six feet in height, and as much through. There is also a variegated form of this daphne, which is quite as hardy as the type. Daphne indica is held at Kew to be identical with D. odora, but in Nicholson's Dictionary of Horticulture the two are treated of as distinct species, with different dates of introduction. The plant is an evergreen, with leaves about four inches in length and an inch in breadth, which are of a dark, shining green. Plants should, if possible, be secured growing on their own roots, but, unfortunately, it is one of the subjects that suffers from the grafting craze, the stock generally used being the Spurge Laurel, Daphne laureola, or D. Mezereum. It, however, strikes readily from cuttings, and layers are easily procured from well-established bushes.—S. W. Fitzherbert.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

MILTONIA VEXILLARIA.—There are different methods advocated for the successful cultivation of M. vexillaria, and perhaps the greatest difficulties arise over the matter of repotting. All growers practically agree that annual repotting is desirable, but they differ as to the time when repotting may be carried out to the best advantage. I would point out that conditions under which the plants are grown must materially alter, if they do not altogether govern, the method of treatment. Since first writing on this subject in the Gardeners' Magazine I have advocated annual repotting at the season when the new roots make their appearance at the base of the growth. Rooting usually commences at the time when the new pseudobulb is being formed. The flower scapes also appear about the same time, but the plants are so rapid in their root action that, with proper treatment, the plants re-establish themselves so quickly in the new compost that no ill-effects are apparent from the operation when the flowers have expanded.

POTTING.—I advise that plants of M. vexillaria be turned out of their pots as soon as the new roots make their appearance; cut away all dead and decaying matter about the roots and base of the bulbs. The size of pot used must be governed by the strength of the plant; the pots should be clean, and filled to about one-half their depth with chopped bracken roots. The compost should consist of about equal portions of fibrous peat, chopped sphagnum, and broken oak or beech leaves, with sufficient rough sand or finely broken crocks added to render the whole porous. Press the compost firmly, but not hard, and care should be observed to have the base of the new growth on a level with the surface of the potting compost; there is a danger, if the growth is in any way buried, of an excess of moisture accumulating, which may cause rotting at the base. I like to have the plants slightly mounded up to the centre, above the rim of the pot. After repotting water with rain water, thoroughly wetting the potting compost. Keep the house rather close for a time, and give every encouragement that will aid the plant to become re-established. Frequent dampings between the pots, and light spraying overhead when favourable conditions permit, will be found beneficial. Shade carefully from glaring light until the roots get hold of the new compost, after which more light and the necessary encouragement must be given to assist in expanding the flowers and the development of the tints characteristic of the variations. M. v. superba, and the type with smaller flowers, which bloom later in the season, may have their repotting delayed, but, as a rule, they are found to be actively rooting at about the same time as the large-flowered types.

M. ROEZLI grows best in the stove or East Indian house. One rarely sees this species well grown, and yet at one time it was a prominent feature at exhibitions, but not being conveniently accommodated, since cooler orchids have become more cultivated it has almost disappeared. The cultural requirements of this species are practically the same as those afforded to M. vexillaria, in so far as repotting is concerned.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

POINSETTIAS.—These plants have a naturally erect habit, so that if specimens are desired attention must be given to pinching out the points of the earliest rooted plants. In this northern district we do not consider it advisable to stop the plants later than the middle of July. The flowers are insignificant, but the intense scarlet bracts around them cannot be surpassed for their charming colour, which is so useful at the season in which the plants bloom. When grown to single stems plants are more serviceable, and more accommodating for grouping in conservatory or house decoration. For this purpose it is not necessary to root the plants so early as those required for specimens. Select cuttings which are about two or three inches in length, take them off with a heel of the old wood attached, and place singly in small thumb pots. Keep them close in a bottom heat of about 75 to 80 degrees, taking care to remove damp or decayed leaves as soon as observed. Under this treatment root action will soon commence, when a little air admitted to the frame will gradually harden the plants before they are removed to a light position near the glass. Although poinsettias succeed best when exposed to the influence of the sun and light, they require a light shade after repotting, which ought to receive strict attention until they are finally potted into their flowering pots. The strongest plants will require pots about 6¼ inches in diameter. From plants raised later in the season a very useful stock of small material may be grown, and flowered in small 60-sized pots; these are most useful for table decoration. During August and September the plants may be grown under cooler conditions in heated pits or frames, but the temperature ought not to fall below 50 degrees. They may also be kept somewhat drier at the roots, and syringed less; under such treatment they will be kept dwarf, and thoroughly well ripened. The plants ought to be housed before the nights become too cold, or the foliage may suffer.

PANDANUSES.—P. Veitchi still retains its high position, and where table plants are required it forms a valuable and useful plant. It is also very handsome in a large state, when one is in a position to accommodate it. Plants are easily raised from suckers taken from the base of the old plants any time during spring, and they will form useful decorative material during autumn and winter. Pandanus Veitchi will show its colouring more distinctly when the roots are kept restricted.

PANAX VICTORIÆ may now be readily propagated from cuttings rooted in small thumb pots; it is of easy culture when grown in the stove.

CISSUS DISCOLOR.—To grow this successfully a brisk stove temperature is requisite. Cuttings should be selected from the young shoots, consisting of three or four joints, and placed singly in small pots and kept close they will root freely in a few weeks. Pot up the plants as soon as ready, using a good open rich compost of fibrous peat and loam. In all stages of their growth the plants require to be plentifully supplied with water, and syringed regularly overhead. They are well adapted for covering a trellis or back wall in the stove, a position in which they succeed best when planted out in a border. They should at all times be kept free from attacks of insects. The leaves also retain their colour better when moderately shaded from the hot sun.

GENERAL REMARKS.—Attention must be given to all seedlings, as required, and care exercised in shading from sudden outbursts of sunshine. Damping down the paths and stages must be done more frequently now.—John Donoghue, Bardon Hill Gardens.

FRUITS UNDER GLASS.

PLANTING VINES.—New borders made during the winter will be now in a good condition for planting, and the work should be done without delay. One-year-old canes are perhaps the most suitable, providing they are healthy, and have good roots; lay back the soil to about six inches deep, thoroughly wash the roots out in a tub of water in the house where they are to be planted, then lay the roots out all level on the bed, and cover them over with the soil. Plant from 3ft. 9in. to 4ft. apart. If space is available more room may be given; water in, tie the rods down, damp them over twice a day, and maintain a night temperature of 55 degrees, with 60 degrees by day. Allow the shoot nearest to the bottom wire to extend, but do not cut the upper part of the canes off for some weeks, in case they should bleed. As soon as the foliage has expanded allow air in the house at all times to ensure good matured canes. If a three-quarter span vinery is to be planted, and room is available on the back wall, this may also be filled in the same way, and the canes may run to the top in one season. As these will be planted as supernumeraries to the front or permanent vines they may be allowed to bear next season, providing the canes are strong enough. The practice of planting supernumeraries in the permanent borders does not give good results, as when they are flourishing they have to be cut out. A few in pots grown on the stage and run up between the front ones has perhaps more to commend it. The vines planted on the back wall may be allowed to extend more rapidly than the front ones, so as to meet present requirements in the shape of fruit, and they can be cropped heavily.

VINES that were started early with the intention of getting the crop off and planting young green canes, should be pushed on to their utmost limit. If the crop can be cleared early enough there is no better way of managing young canes, especially Muscat of Alexandria. Very often, in June and July, other work is very pressing, but extra labour is repaid by this proceeding; material for the border can be got ready, and if the canes are planted in July they will have a good start.

MUSCAT VINERY.—Where a few canes of Black Hambro are planted in the same house as the above no fear as to setting need be entertained, especially if a little circulation of air can be given on favourable occasions. Maintain an even temperature, and freely distribute pollen with a rabbit's tail. Keep the house somewhat drier at this period.

FIG HOUSE.—Regulate and stop the shoots of figs as required, with a view to having the growths well ripened for another season. Stop these at the fifth or sixth leaf, and reduce the syringing as the flowering stage is approached. Assuming that the roots are confined in a bricked-up border, they will take plenty of water, both liquid and clear; if the roots are rambling about the fruits are liable to drop off, and gross growth will result. Fig roots should be confined over ample drainage.—A. B. Wadds, Paddockhurst Gardens.

THE KITCHEN GARDEN.

SPINACH.—A good sowing of this vegetable should now be made in the hope of obtaining a good supply at the latter part of May. When the seedlings are two inches high they should be severely thinned, so that the plants left may have more room, and produce a more succulent and better flavoured leafage than if left crowded together. Ply the hoe between the rows of winter spinach at intervals.

ONIONS.—Advantage should be taken of fine weather to get the seed sown, but at the time of writing the soil is sodden.

EARLY CARROTS.—An early, quick-growing variety should now be sown on a warm border to succeed those in frames, as young carrots are always welcome. The main crop varieties may remain in the seed drawer a bit longer.

ASPARAGUS.—This excellent vegetable is always in great demand, so where very old beds exist, and these show signs of exhaustion, now is the time to prepare new beds. Asparagus requires a warm, rather light, rich soil, with good drainage. The ground should be deeply trenched, at least two feet, or more, if possible, working in as the work proceeds plenty of farmyard manure, burnt refuse, and old potting shed soil; and in addition to these ingredients the top spit taken from an old pasture and worked in will prove highly beneficial to the crop. When planting the roots the lines should be made three feet apart, and the plants put out at a distance of two feet apart in the rows. Spread the roots out carefully, and cover them about four inches deep. Two-year-old plants are the best to use, and if a little seed be sown each year in April there will always be young plants coming on for making new plantations annually. The best time for planting asparagus is just when the growths are about an inch long. The permanent beds should now be given a little top-dressing, composed of wood ashes and a little bone-meal, which will stimulate the crop.

VEGETABLES IN FRAMES.—Carrots, turnips, globe beets, etc., will require thinning a little, so that they may have a chance to bulb better. Give plenty of air when the weather is fine, but avoid cold currents at all times; damp the frames down in afternoons when it is warm, as this will be conducive to quick growth. Potatoes will want earthing up, and if the haulm is inclined to topple over, a few short sticks put in will support it. Cauliflowers and cabbages growing in frames may be given more air and moisture as they increase in size. Prick off Brussels sprouts and more cabbages, according to the number of plants required. Peas that were sown early in the new year should be syringed, and closed up with a little sun-heat to hasten on the crop.

MUSHROOMS.—Manure for forming new beds should still be collected, placed in any dry airy shed, and turned over daily. Continue to put in new beds, as soon as it is seen that the old beds are becoming exhausted. The beds will begin now to take more water, and also the house will require more moisture on the floors. Always use tepid water for the beds, and if a little salt be added it will have a beneficial effect on the produce.

HERBS.—Seeds of most varieties should now be sown in rows, and when the plants are large enough they should be transplanted into beds, keeping each variety separate, and properly labelled, which will save no end of trouble when the several kinds are asked for.

GLOBE ARTICHOKES.—The protecting material may now be removed from these, and the surface of the bed slightly dug over to admit air. The ground should be deeply trenched and well manured where new beds are to be made, but it is still too early to put out young plants.

VARIOUS SEEDS.—Small quantities of lettuce, radish, turnips, Brussels sprouts, cabbage, kales, cauliflowers, and broccoli should be sown either in lines or little beds. I always prefer the latter method, as the plants seem to get more air and keep sturdy from start to finish.—T. W. Birkinshaw, Hatley Park Gardens.

Thyrsacanthus rutilans.—This is a well-known intermediate house plant, whose very distinct and highly decorative features are scarcely recognised to the extent that their merits entitle them to. It belongs to the natural order acanthaceæ, and, like several of its allies, especially the aphelandras and Jacobinias, it is useless to stop it in order to obtain bushy plants, as it is only on the very stout shoots that the finest flower clusters are borne. Added to this the long pendulous racemes of the thyrsacanthus need to be well elevated in order to display the beauty of the flowers, and, even if the plant runs up to a height of 4ft. to 5ft., it is, in the case of vigorous examples, none too tall, as the strongest will even then hang down nearly to the pot. In the case of shorter plants, it is sometimes necessary to suspend them in order to allow for the development of the racemes. In the cultivation of this thyrsacanthus, a great point is to secure good cuttings in the spring, and to grow them afterwards without check. Too dry an atmosphere must be avoided as the leaves are rather liable to be attacked by red-spider, the only insect pests to give much trouble in their culture. This thyrsacanthus is a native of Colombia, and was introduced over half a century ago.—W. T.

SCIENTIFIC ASPECTS OF SOILS.

The following extracts from the highly important paper read by Professor F. H. King, at the Congress of Horticulture, at Jamestown, U.S.A., will be found not less useful to horticulturists in this country than to cultivators in America.

Composition of Soils.

Soils are an aggregation of rock and mineral fragments, carrying an admixture of organic debris, together with substances in soluble and colloidal condition. The productivity of soils is determined by their composition, by their structure, by their climate, and by the life activities within them. By composition we refer to their mineral and chemical nature; by their structure we refer to the size of the soil grains and to the segregation of them; by their climate we refer to their water content, their temperature, their aeration, their drainage; by life activities we refer to the inter-action of the roots of plants and micro-organisms upon one another, upon the soil grains, upon the organic matter, upon substances in solution and upon colloids.

The composition of soils, and their structure, so far as it influences weight, determine the absolute amount of plant food elements per unit volume, per cubic foot, per acre-foot, or per acre-four-feet, which is the depth to which most crops are able to feed, the depth to which they send their roots it all the factors of productivity are at their best. Composition, therefore, determines the endurance of a soil, the outermost limit of its productive capacity.

Mistaken Teaching.

Mistakes in teaching have resulted from confusing plant food elements with plant food. Rigid chemical analysis has demonstrated that primary rock, crushed to the fineness of soil, may carry per acre-four-feet, seventy-eight tons of potassium, 250 tons of calcium, 133 tons of magnesium, and even eight tons of phosphorus. So, too, an acre-four-feet of good soil may carry as much as 100 tons of potassium, forty-five tons of calcium, thirty-five tons of magnesium, and even twelve tons of phosphorus, and there is this much foundation in fact for the statement we have criticised. But these enormous amounts of plant food elements present in the root zone of field crops are no more to be regarded as plant food for those crops than they are food for the animals feeding upon pasture grass.

The food of plants, derived from the soil, is only certain substances which are dissolved in the soil moisture or which are carried in the soil in a form which may be readily so taken up as it is needed; and the amounts of these present in the root zone of field crops at any one time are relatively very small when compared with the amounts of the plant food elements from which they are derived. Much more is a soil like a pasture where plant food grows than like a bank or granary where it is stored, and just as a rich pasture may produce sufficient grass to carry a large herd, so may a fertile soil produce from day to day plant food sufficient for good crops. Just as pastures differ in the amounts of herbage on the ground and in the amounts they are able to add to this as it is fed away, so do fields differ both in the amounts of plant food present in the root zone at any one time and in the amounts they are able to add as this is withdrawn.

Soil Demonstrations.

Our own observations have demonstrated that four good soils, observed to produce 2.5 times the yield of corn and potatoes per acre that four poorer soils did under identical treatments, also gave up, when washed three minutes in five times their weight of pure water, 2.58 times as much plant food. Not only was there this difference in the amounts of plant food carried in water-soluble form in the best and in the poorer soils, but the amounts of this same plant food taken out of like areas of field by like numbers and kinds of plants during the same time was 3.2 times as great in the sap of the plants which gave the highest yield. Such observations would appear to fully justify the general conviction that increased yields should be directly attributed to better feeding and that better feeding is a direct result of larger amounts of plant food available to the crop. It is taught, however, by the Bureau of Soils, that all soil solutions are sensibly identical in composition and in concentration; that they are strong enough for large yields and that this strength will be indefinitely maintained. From these conclusions the Bureau further teaches that mineral fertilisers, green and stable manures and a good rotation of crops owe their efficiency to the power they have of neutralising toxic principles which tend to accumulate in cultivated soils, rather than to any power of increasing available plant food, an abundance of which at all times and in all soils is held to be present.

Available Plant Food.

While it is true that good soils may yield to pure water two, three, and more times the amounts of plant food that poorer soils will, and while the absolute differences may be as 3,200-pounds per acre-four-feet to 1,200 pounds, yet these quantities are so small in proportion to the total water present in the soil that one may with truth say, from the standpoint of the chemical balance, as Professor Whitney does, that the composition and concentration of all soil solutions are sensibly the same. Nevertheless, it is undoubtedly true that soil solutions are measurably different, both in composition and concentration, and from the standpoint of plant functions they must be profoundly so, for organic life is almost inconceivably sensitive to small quantities of matter.

Our published results show, too, that we are able to recover from the surface four feet of good soil as much water-soluble plant food of both potassium and phosphorus as would be removed from a field by nine forty-bushel crops of wheat per acre, and from poorer soils as much as would be removed by six such crops, and here is what has been thought a safe foundation for the contention that even in water-soluble form the poorest soils contain plant food enough for good yields. So there is, in absolute quantity, but not in available quantity. For example, a three-horse tread-power may be in such condition that when one horse is put upon it no work is done; adding a second horse may yet yield only half an available horse-power, but when the third horse is put in place its whole weight may yield effective power, so that the available work becomes three times what it was with two horses. So it may be with soils. Plant food enough for perhaps many crops must be present in order that enough for one may become available.

Natural Manuring.

So far as we know, either from published data or on a priori ground, there is no foundation for the hope that the supply of plant food in soils may be indefinitely maintained simply by good tillage and suitable crop rotations, which make positive additions only of nitrogen to the soil. The only way Nature has ever produced crops, and this is the way she has always maintained soil fertility, has been to return to the field the whole crop, and by working along this line for a thousand years together she never did and never can bring all her fields to an equality in productive capacity, as should be the case if all soils carry an abundance of plant food.

A very simple calculation, based on well-established data, will show that an exhaustion of the plant food elements, large as these amounts are, must necessarily follow any system of cropping which involves no return to the soil other than nitrogen. The amounts of plant food removed by certain crops are definitely known; the absolute amounts of plant food elements carried by good soils are known, and taking twenty tons of potassium per acre-foot, which is about the amount carried, a quantity equal to the whole of this would be removed in about 1,400 years by wheat yields of forty bushels per acre; and the entire amount of phosphorous carried by the surface foot is equivalent to only about 400 such crops. Careful records have shown, too, that the Mississipi river carries out to sea annually enough material to lower its entire drainage area one foot each 4,000 to 6,000 years, which means that the surface foot of soil may be completely removed and replaced by a corresponding layer from below at the same rate, but the rate of removal of potassium by a forty-bushel crop of wheat is three to four times as rapid as this, and the crop exhaustion for phosphorous is ten to fifteen times as rapid as rock is being converted into new soil on the average over the Mississippi valley.

Soil Structure.

From the standpoint of structure, soils differ very widely, both in the extent of their internal surface and in the character and extent of the segregation of their particles. These differences are fundamental, and very important in determining the relative productive capacity and in directing agricultural practice. An acre-four-foot of one-foot granite blocks would possess an internal surface of twenty-four acres to which water might adhere, upon which plant food might develop and where it might be stored, over which the roots of plants might spread and feed, and where soil organisms might dwell. To reduce the diameters of these cubes from one to one-thousandth of a foot would increase the internal surface one thousand-fold, making it aggregate 24,000 acres per acre of field. But even this surface is too small to maintain a high productive capacity. Our coarsest sandy soils possess an internal surface per acre-four-feet exceeding forty-five square miles per acre of field; our loams, 270 square miles; while our finest clay types possess an internal surface exceeding 1,300 square miles per acre of field. It is clear, therefore, that there must be wide differences in the productive capacity of soils due to differences of internal surface alone, even where their chemical natures may be identical. This must be so, because where there is more surface more water can be retained, plant food may form more rapidly and more may be stored and held in reserve and even accumulated during intervals of small demand, as well as retained against loss by leaching.

The innermost portion of water films investing soil grain surfaces, in my judgment, is held there with so much force as to be little subject to change, either by drainage or capillary movement, and also becomes highly charged with plant food, which likewise is strongly retained, escaping only by the slow process of diffusion when the roots of plants are placed in contact with the soil grain surfaces or when the excess hydrostatic and capillary portions of water are moving by. We have found, for example, that when a chemically cleaned sand was charged with a solution of potassium nitrate, ten repeated washings in twice its weight of distilled water still left in the films of moisture retained by the sand grains enough of the nitrate to represent 244 pounds per acre-four-feet. Plant food so retained by soils may still be available to crops, for their root hairs are similarly invested with water films, and when placed in apposition with the soil grains the water film becomes common to the two, and simple diffusion permits the root to feed upon the plant food so retained.

Drainage.

This brings me to consider a principle underlying proper land drainage. It is very important that when rain falls upon a field the excess water remains only just long enough on its way through the open water passages to saturate the soil; anything longer than this provides time and opportunity for the most valuable plant food materials carried in the water films about the soil grains to diffuse out into the moving water and so become lost in the drainage.

THE WINTER-FLOWERING
CARNATION SOCIETY.

GRAND EXHIBITION.
On WEDNESDAY, April 1st,
in the
ROYAL HORTICULTURAL HALL, VINCENT SQUARE.
Admission, 1 p.m. to 5.30 p.m., 1s.
ALL THE LATEST NOVELTIES.
The best display of Decorative Carnations ever seen in England is anticipated.
ANNUAL MEETING of the Society same night in Hotel Windsor, Victoria Street, S.W., at 8 p.m.
All particulars from the Hon. Sec.
Mr. HAYWARD MATHIAS.
Lucerne, Stubbington,
Fareham, Hants.

The Annual Meeting will be preceded by a DINNER (members and friends) in the HOTEL WINDSOR, at Seven p.m. Tickets, 4s. each, from the Hon. Assistant Secretary, Mr. E. F. HAWES, Royal Botanic Gardens, Regent's Park, London.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Botanic Society.

After the few beautifully bright and spring-like days, it was especially disappointing to find that wet weather had set in in earnest on March 25, the date of the Royal Botanic Society's first show of the year. The exhibition was not a large one, but it was interesting. The alpine plants shown were numerous, in great variety, and contained many novelties. Forced flowers played their part, and cyclamens and primulas added brightness to the meeting.

Messrs. T. S. Ware, Lim., Feltham, arranged a bank of alpines in rockery fashion. Here they had coloured primroses, Primula frondosa, saxifrages in variety, hellebores, sedums, etc. One end of the exhibit was devoted to a strain of large-flowered forms of Primula obconica gigantea, a very fine strain; P. verticillata, Narcissus bulbocodium, Veltheimia viridiflora, Lachenalia lutea, Dendromecon rigidum, Trapæolum tricolor, etc. The Misses Hopkins, Mere Gardens, Shepperton-on-Thames, showed some very pretty coloured primroses and several species of primulas, with hellebores, saxifragas, iris, etc. A large group of very finely grown cyclamens, white, rose, red, crimson, salmon, and pink, was arranged by the St. George's Nursery Company, Harlington, Middlesex; the plants were in 48-sized pots, and carried a profusion of large, clean, substantial flowers. The setting of maidenhair fern helped materially to show up these useful flowers. The Salmon King variety shown by this firm is worthy of special mention.

Messrs. William Cutbush and Son, Highgate, set up an interesting exhibit of alpine and early hardy plants. The back of the display consisted of forced forsythias, lilacs, spiræas, magnolias, deutzias, pyruses, and azaleas, and in front of these were pretty batches of single white, single red, single pink, and double red and blue hepaticas, and Primula rosea. A few choice subjects were the handsome Incarvillea grandiflora, the blue primroses, Adonis amurensis fl.-pl., Stylophorum diphyllum—with bright golden flowers, and Iris sindjarensis.

Primula obconica grandiflora, a large-flowered strain, represented by a considerable variety of colouring, was largely and well shown by Messrs. J. Peed and Son, West Norwood; with these were P. Kewensis, a few forced daffodils, muscaris, and a collection of saxifragas, sedums, and other alpines. Mr. S. Mortimer, Rowledge, Farnham, contributed a few good flowers of carnations Jessica and Victory. Mr. T. Williams, Oxford Road, Ealing, contributed a table decoration in white and pale pink tulips.

Messrs. R. Felton and Son, Hanover Square, showed some large vases of exquisitely beautiful Richmond, Liberty, Mdme. Abel Chatenay, and Kaiserin Augusta Victoria roses, of Enchantress carnations, and beautifully flowered plants of the Comte de Kerchove azalea set in gilded baskets, and forced lilacs. The central feature of the exhibit was a rather extravagant floral design, representing a reindeer and sleigh. There was a small model reindeer a couple of feet high, with a nodding head, drawing the wicker sleigh. The body of the latter was decorated with single and double violets, daffodils, yellow marguerites, and acacia sprays, while the hood was composed of scarlet anemones, acacia, and sprays of Asparagus Sprengeri. The whole design was very novel, and attracted a great deal of attention.

Messrs. Robert Green, Lim., Crawford Street, W., put up a large bank of palms, Acer negundo, Azalea mollis, spiræas, tulips, and ferns, but with a little more time at disposal the group could have been made more effective.

MEDALS.

Gold.—St. George's Nursery Company, Harlington; Messrs. R. Felton and Co., Hanover Square.

Large Silver-gilt.—Messrs. W. Cutbush and Son, Highgate; Messrs. Robert Green, Lim., Crawford Street, W.

Silver Gilt.—Messrs. T. S. Ware, Lim., Feltham.

Large Silver.—Messrs. J. Peed and Son, West Norwood.

Small Silver.—The Misses Hopkins, Shepperton-on-Thames.

AWARDS.

Award of Merit.—To strain of cyclamen from St. George's Nursery Company, Harlington; to Stylophorum diphyllum, from Messrs. W. Cutbush and Son, Highgate, N.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, March 17.

Present: E. A. Bowles, Esq., M.A., F.L.S. (in the chair); Dr. M. C. Cooke, Messrs. C. E. Shea, R. H. Curtis, W. B. Hemsley, E. Hales, H. J. Elwes, J. T. Bennett-Poë, A. Worsley, L. de B. Crawshay, E. M. Holmes, W. C. Worsdell, G. S. Saunders, H. T. Güssow, and F. J. Chittenden (secretary).

AGAVE AND YUCCA DISEASED.—Mr. G. S. Saunders showed a specimen of each of these plants attacked by a fungus. Mr. Güssow took these to examine.

CURIOUS ROOT OF DANDELION.—Mr. E. M. Holmes showed a root of Dandelion having numerous lateral roots springing at right angles from the main root, and very much thickened.

INOSCULATION IN HORNBEAM.—Messrs. James Veitch sent branches of hornbeam (Betulus carpinus), taken from a garden hedge, in which a very perfect junction had occurred between the two by a sort of natural inarching or inosculation, as it is more properly called. Mr. Elwes drew attention to the fact that if young hornbeams are planted so as to form a lattice, as time goes on, inosculation occurs wherever two stems come in contact, and finally an impenetrable hedge is formed.

TUBERS OF SECHIUM EDULE.—Large tuberous roots of this plant, grown from a tuber plant in a pot in the Melon house at Wisley, about the beginning of September, were shown by Mr. Chittenden. The plant had produced several large tubers, and these are said to be very palatable when cooked, and greatly resemble yams in appearance. The plant had been received under the name "Chrystophine," and is also called "Choco." The plants had not fruited at Wisley.

CROSSES OF ALBINO ORCHIDS.—In reference to Mr. Hurst's communication to the last meeting upon this point, Mr. Rolfe wrote: "Paphiopedilum insigne Sanderæ x P. bellatulum album does not yield an albino hybrid (see Orchid Review, 1908, p. 72), as should have been the case according to the theory mentioned by Mr. Hurst at the last meeting. It has very numerous minute purple dots on both the petals and dorsal sepal, though the ground colour is whiter, and the spots fewer and very much smaller than when the ordinary forms of the species are crossed. P. bellatulum album 'selfed' would, I have little doubt, come true, and P. insigne Sanderæ x P. Lawrenceanum Hyeanum I should expect to give coloured hybrids, because it is a precisely parallel cross to P. insigne Sanderæ x P. callosum Sanderæ, and combines the same quite distinct sections of the genus. In fact, P. callosum and P. Lawrenceanum (with, of course, their albino forms) are very intimately allied. The mysterious 'factor' supposed to be involved, I believe to be simply the opportunity for reversion which is afforded by crosses between such diverse species. The two combinations last mentioned should certainly be attempted."

DWARF FORM OF RHODODENDRON TRIFLORUM.—From F. I. P. Magor, Esq., of St. Tudy, Cornwall, came a specimen of the dwarf form of Rhododendron triflorum, raised at the Royal Gardens, Kew, from seed sent there by Mr. Peter Barr. The plant is not a foot high, and flowers in Cornwall in the open from a month to ten weeks earlier than the type, the earliest date being the last week in February, 1905.

SEEDS GERMINATING IN FRUIT.—From Mr. Cave, of The Gardens, Holker Hall, Cark-in-Cartmel, came a fruit of tomato in which several of the seeds had germinated, some of the seedlings having thrust their way out through the wall of the fruit and become green. The phenomenon is not very uncommon, and examples may at times be found in oranges, lemons, melons and some other fruits, while in some plants such as the mangrove, it normally happens that the seed germinates while the fruit containing it is still hanging attached to the plant, and the same thing has been recorded as occurring in Sechium edule.

DOMINANCE AND REVERSION IN DENDROBIUM CROSSES.—Gurney Wilson, Esq., of Glenthorne, Haywards Heath, showed pseudo-bulbs of a cross-bred dendrobium, and of its parents, D. nobile Ballianum ♀ x D. nobile Murrhinianum ♂. The pseudo-bulb of D. nobile Ballianum is straight, while that of the other parent is zig-zag in growth, owing to the presence of a very marked projection at the nodes on each side of the pseudo-bulb alternately. Of the seedlings of this cross all showed in a marked manner in their pseudo-bulbs the zig-zag character of the pseudo-bulb of D. nobile Murrhinianum. In both parents the flowers are white, but have a faint purplish spot in the centre of the throat. In all the 150 cross-bred plants the flower has reverted to the typical colouration of the species, the spot in the centre of the throat being dark, and the other perianth pieces being marked with purple.

DISEASED PLANTS, ETC.—Several diseased plants and some insect pests were received, and will be reported upon at the next meeting.

Beckenham Horticultural Society.

On Friday, the 13th inst., Mr. Alexander Dean, V.M.H., gave a lecture before the above society, the subject being "Annuals." Councillor A. J. Baker, K.C.C., presiding. The lecturer made out a strong case for annuals, showing how good displays may be made with them, and with but a very moderate expenditure of money. Select lists of annuals were given, with flowers of white, blue, red, and yellow, and it was suggested for large beds to take, say, a dozen kinds with white flowers, or a dozen kinds with blue flowers, etc., etc., and mix the seeds together, and sow, and so have beds of distinct colours. These would not all flower together, but make an attractive display for a prolonged period. Mr. Dean was very warmly thanked at the close of his lecture, and the meeting tendered its thanks to the chairman.

The society's Certificate of Merit was awarded to Mr. J. Northfield, Raleigh, Beckenham, for well-grown plants of Primula obconica.

Reading Gardeners' Association.

At the first of the two meetings held by this association during March the subject for the evening was "Violets," and was introduced in a most practical and interesting manner by Mr. H. C. Loader, of Holme Grange Gardens, Wokingham, who first of all referred to the great popularity of this beautiful flower. It was beloved by all on account of its simplicity and fragrance. Full cultural details were given under the following headings: Position of frames, time to commence operations, situation, preparation of soil, propagation, planting, early summer treatment, preparing winter quarters, lifting and planting, ventilation, watering, etc. Fogs were mentioned as the worst enemies to the growth of violets. The other enemies were spot, red spider, and scald. There were several fine exhibits, notably a group of Sutton's superb cineraria, staged by Mr. J. Carter; several excellent plants of freesias, carrying some splendid trusses of flowers, shown by Mr. F. Alexander, The Gardens, Warden, Southcote Road West; an excellent display of seven varieties of violets by Mr. W. Turnham, The Gardens, Culham Court, Henley-on-Thames; and a bunch of La France violets of remarkable size by the lecturer.

At the second meeting the subject was "Some Insectarian Reflections," and was introduced by Professor Cole, of the Reading University College. At the outset the lecturer stated that he should treat the subject from a scientific rather than from a practical point of view. The various parts of an insect was dealt with, special emphasis being laid on the sight, smell, and flight. The life history of the green-fly brought a very interesting discourse to a close.

Croydon Gardeners' Association.

On Tuesday evening the usual fortnightly meeting of this society was held at the Sunflower Temperance Hotel, when Mr. F. Oxtoby presided over a capital attendance of members who had come to welcome an old member and supporter, Mr. W. Lintott, of Marden Park Gardens, and to hear what this successful cultivator had to say on "Grape Cultivation."

In a homely and at times humorous manner, Mr. Lintott described the methods he adopts to grow grapes. Knowing so well the excellent bunches Mr. Lintott exhibits at the various flower shows in this district, and also at the Royal Horticultural Society's Hall, London, everybody expected to hear of big sums spent to produce these premier exhibits, but in his opening remarks he dispelled those ideas, for apparently he grows them on most economical lines, thereby showing that with much perseverance and careful study of detail it is possible to produce such excellent results. His vine borders are made of ordinary garden soil, which is very surprising, for it is generally considered necessary to use only turfy loam and made in the piecemeal fashion. However, the secret of his success seems to be in the top dressing of the borders, by which he encourages surface roots as much as possible. The soil for top dressing is made of decomposed organic matter, wood ashes, and mortar rubble, and this is well forked in before starting the vines. Previous to this he allows the soil to become quite dry, then he applies clear water in abundance, followed by undiluted liquid manure from the stable manure heaps. This is constantly applied before the growing period commences. The surface dressing is then put on and moisture withheld from the roots till the grapes are set.

He was not forgetful of mentioning the essential point of well cleaning the houses and rods before commencing growth, advising the use of a good insecticide and hot water applied with a stiff brush, and this to be done thoroughly. His first houses are started in December in a temperature of 50 to 55 degrees by night, gradually increasing it to 60 to 65 degrees as growth appears. Early thinning he advises in most instances. Ventilation was another important item, and this must be carefully attended to, otherwise the dreaded rust will appear. When grapes are colouring plenty of moisture may be given, also more ventilation. Only slight shading is advocated by him. To obtain good fruit one must have good foliage, for the leaves are the lungs of the plant. Red spider and thrip must be watched for, and on the first signs of these pests sponge the affected parts at once. After cutting the bunches he advised thoroughly syringing the house and cleansing the foliage, when the necessary rest to the plants should be given. Mr. Lintott commences gathering in early June, and by the end of December the different varieties he grows completes his crop. Growing so many well-known sorts, there is only one new variety, Prince of Wales, he highly recommends.

Several questions were asked and answered, and the audience were unanimous in conveying a hearty vote of thanks to Mr. Lintott.

To add to the interest of the evening there was a fine display of exhibits, Mr. Edwards showing Van Sion narcissus, Mr. Chaff Clematis montana, Mr. Mills a grand specimen basket of nephrolepis, Mr. Oxtoby forced rhubarb, Mr. Thrower a well-flowered Lycaste Skinneri, and a very fine plant of Dendrobium nobile came from the gardens of Mr. Wagner, Coombe Road, which did great credit to his gardener, Mr. A. May.

British Gardeners' Association.

On the evening of Saturday, the 21st, a meeting of this association was held at "Carr's," Strand, for the purpose of forming a London branch. Mr. George Gordon, V.M.H., presided over a large attendance, and in his opening remarks suggested that the branch should devote a considerable share of its attention to the discussion of matters of an educational character. It was decided to form a branch, and that it should be governed by a chairman, vice-chairman, secretary, and a committee of twelve members. As the result of the election that followed this decision, Mr. E. F. Hawes was elected chairman, Mr. Frogbrook vice-chairman, and Mr. Heartless, of Waterlow Park, Highgate, hon. secretary.

Dutch Bulb Growers' Society of Haarlem.

Since January fortnightly meetings have been organised by this society, where new and interesting bulbous plants may be shown for certificates and awards. The following awards have hitherto been given, viz.:—

First-class Certificate to single early tulip, Brilliant Star, orange-scarlet with black base; to Tulipa Fosteriana, a species with enormous scarlet flowers, with yellow or black base; and to Hippeastrum procerum, a scarce, mauve-coloured species.

Award of Merit to single early tulip, La Reine des Reines, lovely pink; and to single early tulip, Hermann Schlegel (or Primrose Queen), a sport from the well-known La Reine; flowers light sulphur, shaded white.

Gold Medal for a group of new seedlings of Freesia Tubergeni; and Silver Medals for groups of forced single and double tulips and Darwin tulips.

Redhill and Reigate Gardeners' Association.

This association held its fortnightly meeting at St. Matthew's Parish Rooms, Redhill, on March 17, Mr. Seaman presiding. A Second Class Certificate was awarded to Mr. Cooper, of Kingswood, for six Primula obconica.

Mr. D. Watson, representative of the Guildford Gardeners' Association, read a well-thought-out paper on "Wild Gardening." Many questions were asked, and satisfactorily answered by the lecturer. A very hearty vote of thanks was accorded the lecturer for his very instructive paper, and he was elected a member of the Redhill and Reigate Association at the close of the meeting.

Sandhurst Gardeners' Association.

The fortnightly meeting was held in the Church Schools, Sandhurst, on March 17. A large number of members were present, and Mr. J. Evans occupied the chair. During the evening a button-hole and spray competition took place. The winner of first prize was Mr. C. Binfield, of Sandhurst Lodge Gardens. Mr. L. Dupond and Mr. D. Moyes acted as judges.

The remainder of the evening was occupied with questions asked by members, some of which were of much interest and caused a brisk discussion, in which Messrs. Townsend, Evans, Moyes, Chapman, Cooper, Comley, C. W. Goddard, M. Goddard, Dupond, and Shepherd took part.

Mr. Townsend, Sandhurst Lodge Gardens, staged pot plants of Staphylea colchica, cut flowers of Primula obconica and cyclamen, and some fine specimens of Windsor Castle and Up-to-Date potatoes. Mr. M. Goddard, Ambarrow Gardens, sent a well-flowered specimen of Tritonia crocea. A hearty vote of thanks was accorded Messrs. Townsend and Goddard for their exhibits.

Cardiff Gardeners' Association.

The 22nd annual general meeting of this society took place at the Philharmonic Restaurant on March 17, Mr. H. R. Farmer, F.R.H.S., presiding over a large attendance. The hon. treasurer (Mr. Malpass) produced the balance-sheet for the year, and this was considered satisfactory. The Hon. Secretary reported upon the successful meetings that had been held during the session 1907-8, and of the advance the society had made.

J. J. Wale, Esq., J.P., was asked again to become president; the vice-presidents were also asked to allow their names to remain. Mr. H. R. Farmer was re-elected chairman; Messrs. T. Malpas and R. T. Went were re-elected hon. treasurer and secretary respectively. The committee were also all re-elected, with an addition of three, making a total of eleven, due to the large increase of the district. A vote of thanks was accorded to the Editors of the London and Horticultural Press for their kindness in publishing accounts of the meetings throughout the year.

OBITUARY.

MR. WILLIAM OWEN.

Mr. William Owen, of the Greenbank Nurseries, Northwich, died a few days ago at the advanced age of 74 years. He was a most successful orchid cultivator, and was held in high esteem as a judge of horticultural produce.

Offices: 148 and 149, Aldersgate Street, London.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

CINERARIAS.—M. J., Ripon: Choose the lesser evil; admit air at the top of the house. During the brightest part of the day a piece of canvas might be suspended along the front of the conservatory.

CHINESE PRIMULAS.—J. T. E., Brentwood: For producing plants to flower during the winter seeds should be sown now, or during the next month. We hope to deal with the matter in an early issue.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—E. O. D., Leiston: We have forwarded your letter as requested, and now, in case it may be needed by some other reader, we give the secretary's address: Mr. William Collins, 9, Martindale Road, Balham, S.W.

AFFILIATION WITH THE N.S.P.S.—B. W., Leamington: You can obtain full particulars from Mr. C. H. Curtis, hon. secretary, National Sweet Pea Society, Adelaide Road, Brentford, Middlesex. The fee is 10s. 6d., and this entitles a society to a silver medal and a copy of all publications.

HANDY GARDENING DICTIONARY.—P. D. C., Montrose: You do not make it very clear what kind of book you want, but, so far as we can gather from your letter, the "Encyclopædia of Gardening" (3s. 6d., Messrs. W. H. and L. Collingridge, 148, 149, Aldersgate Street, E.C.) will be a most useful and suitable work.

AZALEA MOLLIS AFTER FORCING.—M. J., Ripon: Keep the plants in a moderately warm house until they have finished their growth, then put them in a cooler house, and, finally, when weather permits, stand them out of doors in a sunny position, where they may remain until autumn, when they should be planted out or repotted for forcing again. Thin out the growths a little if the plants appear at all crowded.

BEGONIA GLOIRE DE LORRAINE SEEDING.—R. S. H.: Although Begonia Gloire de Lorraine does occasionally seed, it does not do so commonly. There are a number of sports from this very useful begonia, and the chief of these are Turnford Hall, Caledonia, and Mrs. Leopold de Rothschild. The latter is brighter, and has larger flowers than the type. Caledonia is dull white.

SWEET PEA DISEASES AND PESTS.—Y. W., Lingfield: Yes, you will find the chief of the diseases and pests that attack sweet peas, and, fortunately, they are not numerous, described in "Sweet Peas and their Cultivation" (1s. 2d., post free, from the GARDENERS' MAGAZINE Office, 148, 149, Aldersgate Street, E.C.). Some of them are illustrated, and in every case measures for preventing and curing attacks are given.

GHENT QUINQUENNIAL FLOWER SHOW.—T. B., Barnstaple: The sixteenth International Exhibition, held under the auspices of the Royal Agricultural and Botanical Society of Ghent, will open on April 25, and continue until May 3. The occasion will be of unusual importance, as it will mark the centenary of this famous society. The general secretary is Mons. A. Ceuterick, 140, Conpure, Ghent, Belgium.

VARIETIES OF LILIUM SPECIOSUM.—L. M. B., Exeter: This very popular lilium, frequently grown under the name of L. lancifolium, was first introduced in 1832, from Japan. It is one of the most valuable of lilies, responding readily to indoor and outdoor culture, and also lending itself to retardation. The type is white, with claret-red spots. The finest varieties are: Album, white; Krætzeri, very pure white; Melpomene, crimson and white; roseum superbum, rosy-crimson and white; and rubrum, the popular rich rose-red form.

DISEASED CARNATIONS.—Dianthus: The specimen sent gives evidence of a rather bad attack of Carnation Spot, a disease that does a great deal of damage in moist seasons. Judging from the example sent the plants were not well rooted when potted up, and this may in some measure account for the attack, as poorly rooted and otherwise weakly plants are always liable to disease. Cut away all the spotted and blotched leaves, spray the plants with a solution of sulphide of potassium, keep them rather drier at the roots, and stand them on pots or trellis-staging, so that air may circulate freely all around them.

NEW DAHLIAS.—A. L. C., Llandudno: The new cactus dahlias certificated in 1907 were: Mauve Queen (Cheal), The Bride (Cheal), a decorative cactus variety; Flame and Charles H. Curtis (Shoesmith); C. E. Wilkins, Ivernia, Rev. Arthur Bridge, Harold Peerman, Helium, Etruria, Saturn, Clara, and Dorothy (Stredwick). Peggy (Cheal), and Crimson Prince (Webb and Thompson), were the single varieties certificated. Meteor and Eclair (C. Turner); Beacon and Primrose (Stredwick); Lustre (Burrell); A. D. Stoop (Carpenter), and Mrs. J. Brunton (Mortimer), were cactus varieties that were certificated at the Wisley trials for their garden value.

SALT AS WEED KILLER.—N. C., Hitchin: The old custom of dressing walks with agricultural salt to kill weeds has much to recommend it. The application must be made on a fine dry day, as the salt is then more destructive, and not likely to be washed to the sides of the walk. The middle of May is a good time to give the application, and one dressing will usually suffice, but, if necessary, give a second towards the end of the summer. In the case of walks with live edgings, the salt must not be spread within seven or eight inches of the edge, and it should be distributed over the surface in sufficient quantity to form a thin layer. Hot brine is also very destructive to weeds, and does not discolour the walk. To make the brine add one pound of salt to one gallon of water, boil and apply hot.

NAMES OF PLANTS.

A. R. A., Ashford.—1, Garrya elliptica; 2, Gaultheria procumbens.

D. C. W., Carlisle.—Probably Pinus Laricio, a very poor specimen.

G. B., Walton.—1, Chionodoxa Luciliæ; 2, C. sardensis; 3, Saxifraga oppositifolia.

O. G. C., Leyton.—1, Selaginella Kraussiana; 2, Dendrobium Pierardi; 3, D. heterocarpum.

M. F. R., Bristol.—1, Saintpaulia ionantha; 2, Begonia nitida; 3, Pleroma macrantha; 4, Ada aurantiaca.

H. M., Bournemouth.—1, Helleborus corsicus; 2, Saxifraga Burseriana; 3, Cupressus funebris; 4, Sciadopitys verticillata.

W. A., Oldham.—The flowers were very shrivelled when received, but we believe both are forms of Dendrobium nobile, and No. 2 is the better variety.

NAMES OF FRUITS.

A. W., Cornwall.—Grange's Pearmain.

ARTICHOKE, Taunton.—The publication of your answer has been unavoidably delayed. 1, not recognised; 2, Lemon Pippin; 3, Beauty of Kent; 4, Winter Majetin; 5, Herefordshire Beefing; 6, Yorkshire Beauty.

Prudential Assurance Company.—This old-established company continues to flourish and progress. We gather from the valuation report for the year 1907 that in its Ordinary branch the company had 843,206 life policies in force at the end of the year, assuring, with bonus, £93,263,920, and producing a premium income of £4,477,866 per annum. There are 3,769 life annuities payable, amounting to £128,289 per annum. The result of the valuation of the ordinary branch of the business is as follows: Life assurance fund, £36,404,367; reserve for life assurance and annuities, £34,938,049, leaving a surplus, including balance of £266,387 brought forward from 1906, of £1,466,318. In the Industrial branch the life assurance fund is £28,174,921, and the net liabilities £27,106,185, leaving, with the balance of £360,519 brought forward, a surplus of £1,068,736. From these surpluses the sum of £200,000 has been transferred to the investments reserve fund; £50,000 to the reserve fund of the industrial branch. £1,596,374 will be distributed among policyholders, superintendents, agents, and shareholders; and £688,080 will be carried forward. It is interesting to notice, as instancing the encouragement given to provide for old age, that the policies for life assurance and old age, combined, now number 1,626,789, although this branch was only opened in 1895; and they now produce an annual income of £730,313. Further, a sum of over £4,500,000 is provided in respect of free policies granted in lieu of discontinued assurances; for the increase of sums assured given to industrial policyholders; and also for the concession granted in respect of policyholders who have attained age 75 and whose policies have been 25 years in force. In addition to these benefits, a proportion of the profits for 1907 will be distributed by way of addition to the sums assured under claims arising from policies of over five years' duration.

GOOSEBERRY MILDEW IN WORCESTERSHIRE.

At the Evesham County Petty Sessions on the 16th inst., a good deal of interest was taken by fruit growers in prosecutions instituted by the Worcestershire County Council under the American Gooseberry Mildew Order. Mr. Charles Barnett, market gardener, Cambria Road, Evesham, was charged on four summonses with failing to prune gooseberry bushes at Norton and Lenchwick in the manner prescribed by the order and to the satisfaction of an inspector of the local authority, the County Council. Mr. Graham Milward, who prosecuted, said the County Council considered the case was of great importance, and the Board of Agriculture had specially requested them to take these proceedings. He pointed out the great danger of the spread of American gooseberry mildew throughout the country and the need of preventive measures being enforced. The majority of growers in the district had behaved in an extremely proper and generous manner. Twenty-three had destroyed something like 33,000 gooseberry trees. Others, unfortunately, had not behaved so well, and by their neglect had endangered the property of the growers who did all they could to check the disease. Mr. Barnett did nothing under the first Order, and in December, when the Order as to pruning was issued, he was informed what he was required to do before January 31; but it was not until after that date that pruning was carried out. For over six months Mr. Barnett had not only defied the orders of the Council, but placed his neighbours' plantations in jeopardy. In Worcestershire there were 107 plots of land with this disease, and it was most important that all that was possible should be done to stamp it out. Evidence having been given, Mr. H. J. Smith, for the defence, said defendant had done all that was required by the order within a week or two of the time given him. The original Order was for the destruction of the gooseberry bushes, but the feeling of the growers, supported by certain expert evidence, was so strong against that Order that it was withdrawn, and the order requiring pruning substituted. He held that the defendant's slight delay in completing the pruning only constituted a trivial and technical offence. Defendant was fined £3, and costs, in the first case, and it was agreed that the other cases should be withdrawn on payment of costs.

There was a similar charge against Mr. John Woods, market gardener, Oat Street. Defendant said he took 42 bushes up and burnt them, obeyed the orders, and did everything he possibly could; but the weather was very bad, and he had not time to finish the pruning. He was fined £1, and £2 3s. 6d. costs.—"Birmingham Post."

FORTHCOMING ENGAGEMENTS.

TUESDAY, March 31.—Royal Horticultural Society; Fruit, Floral, Orchid, and Narcissus Committees meet at 12 o'clock; lecture at 3 o'clock on "The History of the Cabbage Tribe," by the Rev. Prof G. Henslow; Scientific Committee at 4 o'clock.

WEDNESDAY, April 1.—Society of Arts.

Winter Flowering Carnation Society at Royal Horticultural Hall.

Hayward's Heath Gardeners' Association; lecture on "Seakale and Rhubarb," by Mr. Jarrett.

THURSDAY, April 2.—Linnean Society Meeting.

TUESDAY, April 7.—Brighton Spring Show; two days.

CHRYSANTHEMUM PLANTS.

WHY NOT HAVE YOUR GREENHOUSE bright at the dullest time of the year with a few Chrysanthemums in November to Xmas onwards with little or no trouble or expensive fire-heat? Grown outside all the summer and brought in just before the hard frost comes. They are essentially the flowers for Amateurs. Now is the time for first potting. We are large Growers, and we can especially recommend the following varieties as being free and large bloomers, easy "doers," and of hardy constitution. We offer strongly rooted plants grown from good "sucker" cuttings, similar to those we use for our own cut flowers trade. Mrs. Judson, white; Mrs. Thompson, white; Winter Cheer, pink; M'dle. A. Chatin, white; Mrs. S. Owen, bronze; Major Bonafone, yellow; Church, white.

Any of above, or mixed, 1s. 6d. per doz.; 5s. 50, post free. Cash with order.

MANAGER,
Broughton Nurseries, WICKFORD, ESSEX.

TOMATO PLANTS.

GOOD STRONG WELL-ROOTED STURDY PLANTS in following varieties: "Holmes' Supreme," "Hillside Comet," "Up-to-Date," "Bell's Fruit Grower," "Dawson's Ideal." From 2½in. pots, just about to throw first flower truss. Strongly recommended for early fruiting, as they arrive with ball of earth and roots undisturbed. 1s. 6d. per doz.; 5s. 50; 8s. 100. Papered singly and carefully packed upright for cash with order. Also transplanted plants just ready for potting on in small pots. Good hard little plants, not weak spindly stuff, from seed trays, 1s. 6d. per 25; 2s. 50. All plants raised from especially selected seed from heavy fruiting strains. We are Tomato Specialists, and we know we can satisfy you.

We could fill this paper with hundreds of letters like the following, received last season:

Station Road, Ibstock, 4/5/'07.

Gents.—Received plants safely, and am very pleased with same. Not one damaged.—Yours respectfully,

JNO. WM. ADCOCK.

Kelway's Gladioli

¶ Kelway's Gladioli, the loveliest of all late summer flowers, if planted now, will ensure a display of superb, rich colours that will delight the eye from late summer till the time of frost.

¶ For over fifty years we have been cultivating and improving them, and our Gladioli are not only the most famous of their kind, but being produced in the open fields of Somersetshire they are in every respect more successful than imported bulbs can possibly be.

NOW IS THE TIME TO PLANT.

¶ The following CHOICE NAMED VARIETIES are strongly recommended :—

"Collection 3"—6s. per doz.; 45s. per 100.
" " 5"—9s. per doz.
Mixed Seedlings - 36s. per 100.
Carefully packed and sent for remittance with order.

¶ Have your garden or border arranged on the Langport Plan of

ARTISTIC HERBACEOUS BORDERS.

It will provide you with superb colour effects, and a garden of lovely flowers from spring to late autumn.

¶ On receipt of particulars of size, etc., we suggest the best possible arrangement for the space, giving you an inclusive estimate (a border 50 yds. by 10 ft. costs only £10) The Langport Plan is everywhere acknowledged to be the most economical and most beautiful of all garden schemes.

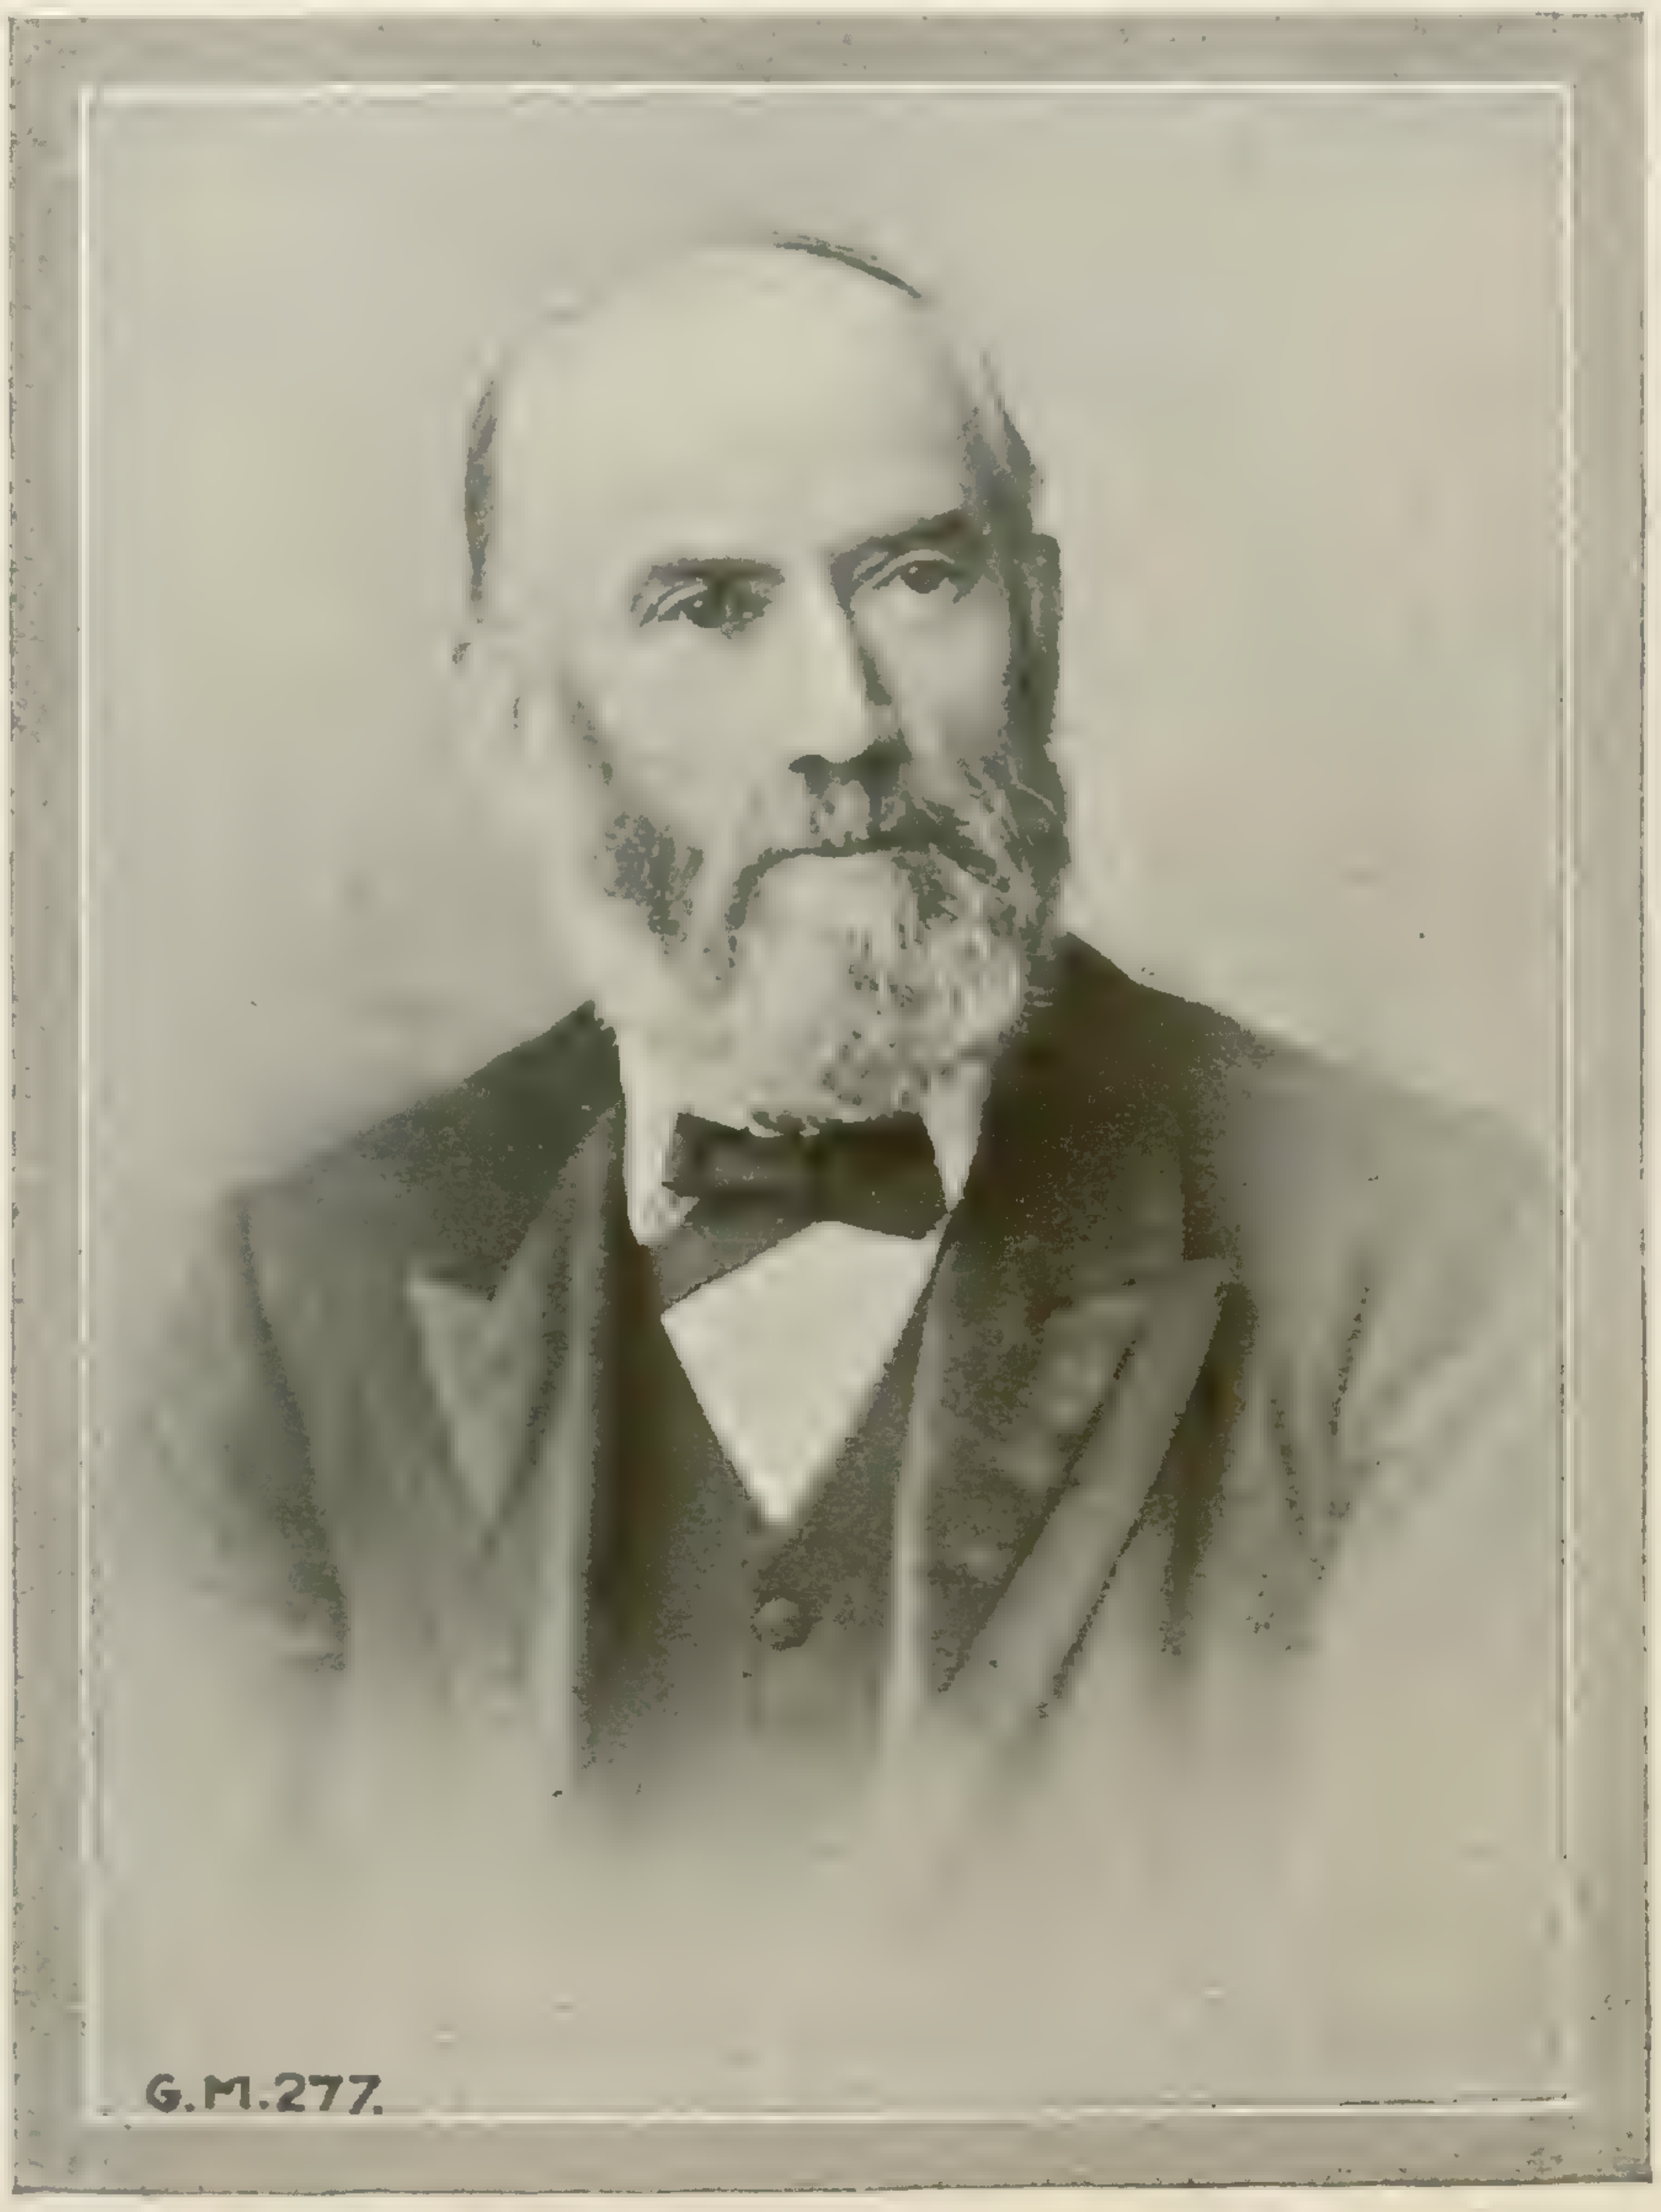
NOTES OF THE WEEK.

Protection of Fruit Trees.



G.M. 277.

MR. ALEXANDER DEAN, V.M.H.

Considering the extreme variability of the English climate and the immense amount of damage that in most years is done in fruit gardens and orchards by spring frosts, it is somewhat surprising the question of protecting fruit trees during the earlier stages of their crop should not have received attention more in accordance with its importance than has yet been the case. There is no difference in opinion as to the advisability of protecting peach and nectarine trees during the period in which the reproductive organs and the young fruits are liable to injury, and it is quite common at this season of the year to see them enjoying the shelter of netting or tiffany or some other suitable material. But when we turn to apricots, pears, and plums, we find them in by far the majority of gardens left to battle with the elements, although protective measures are really not less necessary than in the case of the other two fruits mentioned. Apricot, pear, and plum trees are equally as susceptible to injury from frost during the flowering stage and for some time afterwards, and their fruits are of the highest importance in the economy of the household. Some of our readers may perhaps be disposed to regard pears and plums as more useful than peaches and nectarines, but for our present purpose there is no occasion to institute comparisons between the several kinds. It is sufficient to know that supplies of all are a necessity, and that the value of crops of choice pears and plums is more than sufficient to balance the cost of protective materials and the labour inseparable from their use. We would therefore strongly advise that trees of these two fruits trained to walls, should be protected in precisely the manner as peaches and nectarines placed under similar conditions. An ideal system of protecting wall trees is a glass coping twenty-four or thirty inches in width, with tiffany or fish netting suspended from the lower edge. If tiffany is used, a wire should be fixed along the lower edge of the coping, and a second wire at a distance of about twelve inches from the surface of the border. With this arrangement and large hooks along the ends of the tiffany curtains it will be quite easy to partly uncover the trees during the day and cover them at night. The hooks will, of course, slide easily along the wires, and the tiffany can be put up and taken down with less trouble than when rings are used. Fish nets and tiffany suspended from immediately under the wall coping and kept at a distance of about twelve inches from the surface thereof afford most efficient protection, and as they are comparatively inexpensive they have much to recommend them. The protection of trees occupying positions in the open quarters is a much more difficult matter, but notwithstanding this fact, much might be done in the protection of bush and pyramidal trees not exceeding five or six feet in height. With the aid of a few poles of a suitable height and a strip of tiffany or fish netting, a tree can be so enclosed that frosts of quite exceptional severity will alone do any material damage. It is not beyond the power of the cultivator to protect trees growing in the open that exceed the heights mentioned; but a quite different method must be adopted. Textile fabrics and poles have to be abandoned, and fires in metal pots brought into requisition. In America it has long been the practice when a sharp frost is expected during the flowering season to light fires at different points in the orchards, and to burn materials that will create sufficient smoke to more or less envelop the trees, and thereby check the radiation that is so active under a cloudless sky. It has been long known that the results have fully justified the practice, but this method of fruit protection was not put to a practical test in this country until within a quite recent period. Two or three of the more advanced fruit growers in Worcestershire tried the effect of "smudges" in protecting the embryo crop of orchard fruits from injury by frost, and the results obtained were such as to convince them of the value of smoke as a protective medium. In carrying out the trials metal pots, provided with cross handles and movable lids, were placed at certain distances apart on the windward side of the orchard, and a substance remarkable for the density of the volume of smoke it gives off placed in them. The pots were placed under the charge of a man whose duty it was to closely watch the weather and ignite the fumigant immediately there were signs of frost. It was found that not only did the smoke check radiation, but raised the temperature of the air about the trees within a short time of the fires being lighted, and thus kept the blossom and young fruits safe. This method of protection necessarily involves some expense and trouble, but the cost was found to be very small as compared with the value of the fruit obtained from the protected orchards. In the case of a small orchard it would not pay to employ a night watchman, but this would hardly be necessary, as an electrical thermometer could be so fixed as to give the necessary alarm on any material fall in the temperature, and the lighting of the fires in a few pots can be accomplished in a very short time. The possibilities of this method of protection appear to be such as to warrant further trials, both in private orchards and commercial fruit plantations.

Mr. Alexander Dean, V.M.H., is a striking personality in the horticultural world, and as writer, raiser, lecturer, and judge he is very widely known. He is the younger of three very capable brothers, and while Mr. William and Mr. Richard Dean devoted their attention largely to flowers, Mr. A. Dean has given more attention to vegetables and fruits, and has done more perhaps than anyone living in advocating an extended cultivation and exhibition of the former. Mr. A. Dean raised many good potatoes when at Bedfont, and of these the best known now is The Dean. He has long been a prominent member of the Royal Horticultural Society's Fruit and Vegetable Committee, and, with Mr. E. Beckett, V.M.H., he started the movement that led up to the Vegetable Exhibition and Conference held at Chiswick in 1903. In the same year, Mr. A. Dean initiated a Gardeners' Dinner, and this was by far the most successful function of its kind ever held. It took place at the Holborn Restaurant, in the King's Hall, on September 29, 1903, on the evening of the first day of the last and great Fruit and Vegetable Show at Chiswick already referred to; Mr. Dean acted as secretary to the movement, and there were about five hundred gardeners and garden lovers present at the dinner. As a lecturer and instructor in horticulture under the Surrey County Council Mr. Dean has taken a prominent part in the advancement of horticultural education, while as a judge of vegetables and fruits he has few equals. Of sturdy, fearless, and independent character, Mr. Dean has been most emphatic in declaring his opinions on matters horticultural in the horticultural press, and this has led to many a fierce fight, through which the redoubtable "A. D." has usually emerged triumphant, and never conquered. The horticultural charities and gardeners' associations have no more earnest advocate than Mr. A. Dean. A few years ago he was awarded the Victorian Medal of Honour in Horticulture, an honour well deserved. Mr. Dean now resides at Kingston-on-Thames, where his strenuous advocacy of window and flower garden competitions has led to a material improvement in the appearance of the town. Though past the allotted span of life, Mr. A. Dean is as keen and vigorous as many men twenty years younger, and we hope that the future holds yet many more years of usefulness for him.

Some Notable Norwich Gardens.—In accordance with previous announcements we shall give in the issues of the 11th and 18th inst., a fully illustrated account of some of the more noteworthy gardens in and around the City of Norwich. The gardens that will be described and illustrated will include those of Ashwellthorpe Hall, Blickling Hall, Boyland Hall, Crown Point, Dunstan Hall, Gunton Park, Oakland House, Shottesham Park, Town Close House, and Westwick Hall.

Poison and Pharmacy Bill.—The Joint Committee of the Lords and Commons, to whom this Bill has been referred, held its first public meeting on Tuesday, when several witnesses were examined. With a view to facilitate the sale and purchase of weed-killers, sheep dips, and other poisonous substances used in agriculture and horticulture, Clause 2 of the Bill empowers local authorities to license persons other than chemists to sell such articles. Mr. T. H. Middleton, an assistant secretary of the Board of Agriculture, who was the first witness examined, stated that the view of the Board was that there should be no monopoly in the sale of such poisonous substances as weed-killers and sheep dips, and the present restrictions should be relaxed. The Board agreed that every possible precaution should be taken to avoid the mistakes which often involved death, but these mistakes were, in the opinion of the Board, not so much due to the class of persons who sold them as to the manner in which they were put up. Therefore, the view of the Board was that the regulations as to the form in which these substances were packed should be made very stringent. Mr. T. W. Russell, M.P., in the course of his evidence, strongly urged the inclusion of Ireland within the scope of the Bill.

Centenary of the Société Royale de l'Agriculture et de Botanique de Gand.—The following is the official programme of the several functions associated with the celebration of the centenary of the Royal Agricultural and Botanical Society of Ghent. Friday, April 24, reception of the Jury at the Casino at 9 a.m.; lunch at 2 p.m.; Botanical conference at 5 p.m.; gala performance at the Theatre Royal, organised by the Society "l'Avenir Horticole" of Ghent, 8 p.m. Saturday, April 25, official opening of the international horticultural exhibition, 11 a.m.; visit of the King of the Belgians and Royal Family; reception and fête by the municipal authorities of Ghent at the Hotel de Ville at 8 p.m. Sunday, April 26, official inauguration in the Place du Comte de Flandre of the memorial to the Comte de Kerchove de Denterghem at 11 a.m.; market flower show in the Place d'Armes at noon; raoût offered to the members of the Jury by the Chambre Syndicale of Belgian Horticulturists at the Bourse de Commerce, at 1 p.m.; and banquet in the saloons of the Theatre Royal at 5 p.m. Generous as have been the Belgian horticulturists on the occasion of the Ghent quinquennials they give promise of surpassing themselves on this occasion, and strangely constituted must be those of their guests who do not return home immensely gratified by the splendid hospitality shown them.

History of the Cultivated Cabbage.—At the afternoon meeting of the Royal Horticultural Society on Tuesday last Professor G. Henslow, V.M.H., gave an interesting lecture on the origin of the cultivated cabbage. He traced the history of the cabbage from the time of Cato, 200 B.C., to the present day, and, with the aid of lantern slides, showed the various changes that the cabbage has undergone during the past twenty centuries. Unfortunately, a considerable proportion of the slides were less clear than could have been desired, and the objects thrown on the screen by the aid of these could not be very well seen from distant parts of the room.

Diseased Potatoes. — Two diseases, hitherto unknown in England, affecting potatoes are reported upon in the Royal Agricultural Society's "Journal." Mr. Carruthers, the consulting botanist, states that some tubers had been stored in a somewhat moist place. In a short time there appeared patches of a dark mould, composed of short olive-green bristles. The tissues of the potatoes underneath these patches were brownish coloured. The fungus was found to be Stysanus Stemonitis Corda. This has been hitherto considered as growing only on dead organic matter, but the experiments recently conducted at the German Biological Station at Dahlem have proved that the fungus produces rot in potatoes, which spreads from tuber to tuber when stored in pits. It is also reported from America that the brown disease in potato is caused by this fungus. The spores have readily germinated in the laboratory on healthy tubers which were soon covered with the dark mould. Well-ventilated pits will greatly hinder the growth of this fungus. The other disease manifests itself in raised spots of varying size on the surface of the tuber. At first the epidermis covers them, but by and by the skin bursts and exhibits an olive-green powder, giving to the potato a scurfy appearance. The powder under the microscope is found to be the spore balls of the slime fungus Spongospora Solani Brunch. These balls form irregular roundish or elongated hollow bodies, having somewhat the appearance of a minute sponge, hence the name given to the fungus. The disease was first observed by Brunchhorst, in Holland, in 1886, and has been detected thereafter in several European countries. It has been noticed and has been described by Professor Johnson, of Dublin, in 1906. Though the disease and its cause are known, there has yet to be discovered the manner in which the fungus obtains entrance into the tuber and develops there. Experiments instituted for this purpose are being prosecuted.

The Ghent Jury.—The jury appointed to make the awards at the centenary exhibition of the "Société Royale de l'Agriculture et de Botanique de Gand" will consist of nearly 250 members, and will include representative horticulturists from Great Britain, Germany, America, Austria, Belgium, Brazil, Denmark, Egypt, Spain, France, Holland, Italy, Grand Duchy of Luxembourg, Russia, Sweden, and Switzerland. The British members of the jury are Lord Redesdale, Major Holford, Lt.-Col. D. Prain, and Messrs. James Backhouse, Thomas Bevan, H. G. Cove, C. H. Curtis, Herbert Cutbush, De Barry Crawshay, Findlay, James Gutteridge, R. W. Ker, Stuart Low, W. H Massie, J. McMeekin, F. W. Moore, J. S. Moss, George Nicholson, J. O'Brien, C. E. Pearson, R. H. Pearson, H. T. Pitt, John Robson, Thomas Rochford, R. A. Rolfe, F. Sander, H. J. Veitch, W. Watson, John Weathers, and Brian Wynne.

The Horticultural College, Swanley.—From the recently issued report we learn that the progress reported at the close of 1906 in the various departments was well maintained, and several improvements carried out during 1906. The chief feature of the year is said to have been the establishment of the course of natural history, which has for its object the training of third year students who have passed the ordinary gardening course at the college and wish to increase their knowledge of natural history subjects in order to qualify as teachers of gardening and Nature study. There is a growing demand for teachers so equipped throughout the country which, it is hoped, this course may do something to meet. A new laboratory and preparation room have been fitted up, and these form a valuable and much-needed improvement in the accommodation for the staff and students in their scientific work.

Sandringham Flower Show will, by permission of His Majesty the King, be held on Wednesday, July 22, in Sandringham Park. The exhibition is held under the auspices of the Sandringham Estate Cottage Horticultural Association, and the King and Queen offer prizes for the best-kept cottages and best cultivated gardens on the estate. On show day the gardens, houses, stables, and kennels will be open to the public.

Pear Blister Mite.—Referring to this minute pest (Phytoptus pyri) the "Journal of the Board of Agriculture" declares that there is not much danger of future infection from any mites which may fall with dead leaves. The mites are very small and have limited powers of movement and even if they survived would be unlikely to get back to the trees. The winter is usually passed in the buds. Hand-picking the leaves that are attacked may be practised in the summer, and the trees should also be sprayed in spring with paraffin emulsion and liver of sulphur. Much good may be done by spraying in winter with paraffin emulsion, care being taken that the buds are reached with the spray.

New Fernery at the Edinburgh Botanic Gardens.—In the course of the next few weeks a fine new fernery will be opened to the public in the Edinburgh Botanic Gardens. The structure has been constructed by Messrs. Mackenzie and Moncur, at a cost of £2,400. It is 70ft. long, 57ft. wide, and 16ft. high, with a dome 25ft. high at one end, which gives access to the Nepenthes House. The house will be devoted to tropical ferns, all planted out; the greater part of the plants will be set out in a rockery composed of red sandstone. Two other houses, each 50ft. long, form a part of the new range, and one of these is for temperate ferns, and the other for heaths. Considerable improvements are also being made in the Rock Garden where Pudding-stone, from Callander, is being extensively used. A new rock garden along the Inverleith Row end of the gardens is also another addition and improvement.

Luminosity in Plants.—In a paper read before the Botanical Society in Edinburgh recently, Miss Bertha Chandler, M.A., pointed out that potatoes in a state of decomposition occasionally give off light, but, as a rule, luminosity is confined to the lower plants, such as the fungi, notably the Agarics. The luminosity of decaying wood was attributed to fungi, and it was also shown that decaying leaves were sometimes luminous.

Nitro-bacteria and Sweet Peas.—Dr. J. Howard-Jones, M.D., D.Sc., medical officer of health at Newport, writes: The subject of the inoculation of sweet peas and other leguminous seeds and plants with nitrogen-fixing bacteria is much discussed at present. It might, therefore, be interesting to your readers to know the results of experiments made locally last year. I obtained material for making cultures of the various varieties of these organisms from Professors Bottomley, King's College, and Kellerman, U.S.A. Department of Agriculture, Washington, and treated sweet peas and scarlet runners at Alltyryn Hospital garden with excellent results. The show of sweet peas was magnificent. The inoculated plants produced a larger average number of blossoms per spike and peas per pod than the "control" plants grown under ordinary conditions, whilst the yield of the inoculated French beans was, according to the gardener's statement, more than 25 per cent. greater than that of the untreated plants.

BEGONIA LADY CROMER.

Messrs. T. S. Ware, Lim., Feltham, are fortunate in having Mr. Pope at the head of their begonia department. Mr. Pope was formerly with Messrs. J. Laing and Sons, but for very many years he has now had full charge of Messrs. Ware's begonias, growing these beautiful flowers at Bexley, where he has numerous glass houses and a large piece of suitable land. A very large space would be needed to even enumerate the fine double and single begonias Mr. Pope has raised, but those of our readers who have visited the Temple Show during recent years have had ample evidence of his skill.

Three double varieties that attracted a great deal of attention at the Temple Show of May last, and which we may expect to see finely shown next month, are Rhoda Pope, William Marshall, and Lady Cromer, each of which gained an Award of Merit. Rhoda Pope is a magnificent soft pink begonia, that has double flowers of wonderful size and substance. It has the appearance of a grand, fully-opened rose, and its petals are of great breadth and charmingly rounded and finished. William Marshall is a splendid double variety, of good size and grand habit. It has vivid and very clear orange-scarlet flowers, with the broad petals exquisitely crimped and fringed. One of the most handsome of begonias.

Lady Cromer is a very large and beautiful double variety, that has broad, but not very deep, flowers. It has some general resemblance to a pæony, though we have never seen a pæony so beautiful. The colour is lovely bright pearl pink, an exquisite shade, with salmon tinting at the base. This is a delightful variety, and was generally regarded as the best begonia at the Temple Show of 1907. The present illustration gives a good idea of the form of the flowers of this variety, but fails to convey the beauty of its exquisite colouring.

DOUBLE BEGONIA LADY CROMER.
Flowers bright pearl-pink, shaded with salmon.

LATE-KEEPING DESSERT APPLES.

In agreement with Mr. Markham's wish, I am pleased to give a few notes respecting the best late-keeping dessert apples at The Hendre. Of these Sturmer Pippin is the longest keeper, and one of the most prolific bearers either grown as a bush or standard, and it makes a splendidly shaped tree in either form. The necessity of leaving its fruit late in the season before gathering it, and the fact that it is best flavoured when grown in a warm situation are well known. That its flavour is excellent here may be gathered from the fact that I have been asked by some of my employer's guests how we manage to keep Cox's Orange Pippin so well!

Lord Hindlip is another of our best-keeping highly-flavoured apples, of which, however, we have only three trees, and these are bushes not quite fully developed. Its fruit is handsome, conical in shape, and of suitable dessert size; probably this variety will, when better known, become very popular. Scarlet Nonpareil is not here a regularly heavy cropper, though it well deserves its place. In some seasons it carries heavy crops. It is naturally a weak grower, but it makes a clean, symmetrical bush.

Allington Pippin is a deservedly popular variety, and is one of the most constant bearers and most handsome varieties we possess. We have six healthy bushes of it, and they invariably carry a more or less good crop of fruit. It keeps longer than it is usually believed to do, and improves in flavour by keeping, and until this was pointed out to us we used it too early in the season.. It has been said that I overestimate its value, be this as it may, my opinion has been formed from our experience with it. One of our most useful late-keeping varieties is Brownlees Russet; this makes a handsome, moderately strong bush, and rarely fails to bear good crops of fruit which keep well throughout February, and we have still (March 25) some good dishes of it in sound condition.

The well known old variety Reinette de Canada also succeeds remarkably well here, either as a bush or standard, but neither its trees or fruit can be classed as handsome; by grading its fruit, however, valuable examples both for dessert and the kitchen can be procured. Two other late dessert apples that do well in this district though we do not grow them, are Court Pendu Plat and Fearn's Pippin.

It may interest Mr. Markham and others to hear that Lord Burghley, which is one of his best late apples, is almost a failure here, we seldom secure a good dish, though we have three trees. Northern Greening, which succeeds so well with Mr. Markham, is also unsatisfactory here; we have seven pyramid trees of it. In Sussex, as a standard growing upon heavy ground similar to ours, I have seen this old variety very heavily laden with capital fruits.

Apart from the good long-keeping culinary kinds previously noted, Belle du Pontoise is a handsome free cropper, of excellent quality, that may be classed amongst the best that we grow. Alfriston and Betty Geeson are also highly valued here.

With reference to Mr. Markham's remarks about stocks, it may be mentioned that they have considerable effect upon varieties grown here. For example, we have six bush trees of Gascoigne's Scarlet Seedling, some of them worked upon the crab, others on the paradise, and the difference in the trees is remarkable. Those on the crab are strong in growth, and had to be root pruned to induce fruitfulness, the fruits being large, handsome, but not highly coloured. On the other hand, those on the paradise are moderate growers, prolific without being root pruned, while their fruit is of medium size, and very highly coloured. T. Coomber.

The Hendre Gardens.

Sowing Lawn Grass Seed.—Where this is contemplated, either in forming new lawns or renovating patchy old ones, it should now be attended to. If the ground has been recently dug great care must be exercised in having it well firmed down and level all over, or when settling takes place an uneven surface will ensue. It should be well rammed with large wooden rammers, or rolled with a heavy roller, levelled, raked, and again rolled to obtain an absolutely smooth surface. Choose a calm day, and sow the seeds broadcast and evenly all over, lightly rake in and give another rolling: never attempt sowing when wind is at all strong, as an even distribution of seeds would then be quite impossible. Seed may be sown up to the end of April, but it is not desirable to sow later than that.—E. F. Hazleton.

POTATOES AND THEIR CULTURE.

Almost every person who has a garden, large or small, deems it incumbent upon him to grow part, or all, of his supply of potatoes. This leads to their culture being very frequently attempted under conditions and on soils totally unsuited for good produce. A glance at the market reports will readily show the varying qualities produced by certain soils, the nearest approach to perfection being reached in the red soil of the Dunbar district, and then we get a falling rate through "Kents," "Lincolns," etc., down to the "Blacklands" of the Fens, all this proving that soil is the most important factor in the production of good potatoes.

As gardens in the same district often vary greatly in this matter of soil, the difference being due to the length of time the garden has been under cultivation and the treatment it has had during that period, and not often to the advantage of the highly cultivated plot, our first consideration must be given to the soil. My own experience is that virgin soil, especially that which has been common land, and preferably where furze (gorse) has grown, freely produces during its first years of cultivation, not only heavy crops, but crops also of the highest quality. Such soil is usually what we term "sweet," and if properly broken up, it is friable, and these two factors, viz., friability and sweetness, are necessary to grow potatoes of high quality. On this we should base our cultural operations according to the plots with which we have to deal.

In dealing with a soil which has been soured by a too liberal use of animal manure a good liming is essential, the lime to be slaked in small heaps on the surface and then spread at the rate of about one ton to the acre, and mixed with the soil by digging. Liming both sweetens the soil and adds to its friability, and should be carried out on soil deficient in lime about once in five years. Animal manure should be applied in a thoroughly decayed and easily pulverised condition; clods of fresh or very slightly decayed manure are inimical to the growth of the plants. Concentrated or artificial manures should be used with care, and only after making one's self acquainted with the nature and deficiencies of the soil. For a general artificial manure applicable to most soils the Board of Agriculture recommends one cwt. each of sulphate of ammonia and sulphate of potash and 2cwt. of superphosphate to the acre, in conjunction with some animal manure.

Given a choice of soil I should choose a sandy or moderately light loam, and anything in the way of additions to the soil which will go to produce a deep staple of that nature, always bearing in mind the value of "sweetness."

Choice of Seed Potatoes.

Next we have to consider the question of seed potatoes for planting, and I may say here that well-authenticated trials have given such increased results when the seed has been obtained from a distance, say, Scotch or Irish seed for English gardens, that the mere cost of carriage of such seed, as compared with results is not worth considering. The reason for this is not quite apparent, but the fact remains, and I strongly advise all growers to get new seed from a reliable source and from soil of a different nature each year. The size of the seed potatoes is not important, providing whole sets are not less than 2oz. in weight, and cut sets approximately the same. Cut sets should be prepared a day or two before planting, and the cut surfaces dipped in slaked lime, as this will dry up the wound and prevent the set from rotting prematurely.

I do not propose in this article to recommend special varieties, for the reason that varieties are so numerous, and some which do really well in some districts are failures in others, both in the matter of quality and quantity. The best advice one can give in this connection is to gain some local knowledge and to work upon it. Certain varieties will be largely grown in one's own particular district, and these are the ones to select as the main stay, though, of course, there can be no objection to the trial of a new variety now and then. I will only say that when once a variety has been found to be of poor quality in a normal season that variety should be discarded, no matter how good it may be as a cropper.

Planting.

Planting should take place from the end of March and throughout April and even in May. The great thing is to have the ground in a perfect working condition at the time, and haste to plant is often followed by disastrous results if the soil is in the least degree pasty. It is far better to wait until the conditions are right, so that the soil will not stick to the boots when walking over it. The depth to plant may vary from about 5in. to 7in., the greater depth being suited for light soils and for strong-growing varieties. As regards distance apart for the seed, this should be governed by the strength and height of the haulm, and may vary from 1ft. to 3ft. in the row, and the rows at sufficient distance apart to allow moulding up to take place without exposing the roots.

Where the sets can have the advantage of being laid out thinly and exposed to light several weeks before planting, the new shoots become strong and robust; the method is ideal, but not always possible, and very good sets may be got from heaps of seed potatoes, providing these have been keep sufficiently cool during the winter months, and up to the time of planting.

Assuming that the ground has been dug and manured in the autumn, the best method for garden culture, if it has become at all solidified, will be to fork it through deeply before planting. In sandy soils one may plant with a dibber and draw the soil into the holes by dragging the foot along the row, but this kind of planting is not satisfactory in the majority of soils, and the best method for general application is to throw out a trench with the spade and cover in again either with a spade or a heavy draw hoe. J. C. Tallack.

(To be continued.)

Cockchafer Grubs.—An old country woman once declared that Adam deserved no credit for naming the pig, as anybody would know what to call such an animal; even so no gardener deserves credit for recognising the grub of the cockchafer as a foe, for its appearance would condemn it. But it has a nasty knack of not putting in an appearance until coercion is resorted to, though all the while it may be working overtime under the ground. If the young cabbages or any similar plants at this season are retrogressing instead of progressing it is more than likely that this unwholesome pest is at the root of the trouble. To make sure, set a sharp boy to work with a hand-fork and a tin of paraffin round suspected plants. The fork is to stir the soil to about two or three inches deep; the paraffin is to take the captures—the big, fat, greenish grubs.—E. J. K.

SEDUMS.

The great range and interest of the sedums compels at least some definite notice from all gardeners and garden lovers who are fond of rock gardening. In addition to forming a fascinating study, they are among the most useful of all alpine and rock plants. One may find among them gems for all positions in the rock garden, and the majority are of such easy culture, and provide such splendid masses of flower and foliage, that they must of necessity be given a place.

Sedums are of special value for beautifying exposed positions, and they give splendid effects by judicious massing with the saxifrages, thymes, rock cistus, heaths, aubrietias, alyssums, and other kindred plants.

The taller, erect-growing sedums are especially adapted for making masses on the outstanding bluffs and the more exposed ledges. Such forms as S. maximum, with its ruddy leaves and whitish-red blossoms, and its variety, S. purpureum, with its purple-hued foliage and masses of flower, are well adapted for such positions. Equally suitable is S. Maximowiczi, a bright showy yellow, with light green foliage, which contrasts effectively with the deep hues of the preceding.

If a fair amount of soil is present then the showy S. spectabile, which has long been a favourite garden plant, and its newer variety, S. s. atro-purpureum, a rich crimson-hued form, may be used in conjunction with the others, and they will be found to provide a distinctly pleasing feature.

But I believe I am justified in saying that the low-growing and trailing sedums are the most popular, and the most charming. On an old rockery great masses of the snowy-blossomed S. album, the red foliaged and golden flowered S. obtusatum, the greeny-bronze S. sexangulare, and its golden blossoms, produce a charming effect. The pink and green of S. Ewersi, to say nothing of the great trailing masses of S. spurium or S. stoloniferum, with its crowds of pink flower heads, and its white and deep crimson varieties, which are gloriously effective, give a glowing picture of roving beauty during the summer months. These sedums one should not omit, and a further selection would include S. Kamschaticum, with its deep green foliage and orange-coloured blossoms; its pretty form S. K. fol. var.; S. cæruleum, the pretty annual blue species, with bronzy-green foliage; S. neglectum, the lighter growing variety of S. album; S. telephoides, a strong trailer, with glaucous leaves, and pinkish-purple flowers; S. rupestre, a strong showy yellow species; and the useful S. ternatum, which, like S. cæruleum, is an annual, but differing in the rich bronze leaves and whitish flowers.

Other notable sedums include the pretty pink American S. pulchellum; the dwarf S. glaucum, a grey lichen-hued species, and its golden variety, aureum; S. pubescens, a showy form, with deep green foliage and crimson flowers; and S. acre, the old yellow stonecrop, and S. dasyphyllum, a bluish-leaved species with white flowers.

In my mind, the necessity of growing the sedums, so as to bring out the richest hues their foliage is capable of, is the greatest point in the culture of these useful plants. To accomplish this in the highest degree one requires an open, windswept position, which receives the full play of the sunlight, and of every gale that blows, and a poor gravelly soil, in which the creeping stems may readily root, but which will at the same time ensure that close, sturdy habit of growth which is so admired in plants of this character. Thus one obtains perfection in the colouring of the sedums; the strong winds will keep the growths hard, and close down on the rock face, and the poor soil and sunshine combined will work wonders in the hues of the foliage.

Here you will get S. obtusatum a rich deep ruby-red, which would be green in a shady or moist spot; S. album, S. ternatum, S. sexangulare, and others will take on those lovely bronzy shades which blend so admirably with the grey weather-scarred rocks. The glaucous species will be brightened and rendered more distinct, while S. stoloniferum, and its variety rubrum, will deck themselves out in deep reddish hues, that of rubrum being almost purple in a suitable position. It will be found that these lowly sedums, which often look unkempt and straggling when they are grown in shady or moist positions, are quite different plants when they are out on the rock face, scorched by sun, and swept by winds. Then they are in their element, and it is then that the flower lover can understand and see their marvellous beauties, it is then that they can be appraised at their full value.

P. S. Hayward.

SEDUM CÆRULEUM IN THE EDINBURGH BOTANIC GARDENS. [Photo: D. S. Fish.

A low-growing annual species, with pale blue flowers.

St. Dunstan's, Regent's Park, the late Lord Aldenham's London villa, has been acquired by Lord Londesborough. It occupies a position near the Royal Botanic Gardens, and, like many other of the fine residences in the park, it has an ample garden.

GLADIOLI.

The stately and beautiful gladioli are steadily growing in favour, and each year one finds them more extensively cultivated in both public and private gardens, although in the former they do not appear to have yet found that favour their effectiveness would seem to warrant. Although gladioli may be had in flower in July if the early-flowering strains are planted, it is for late summer and autumn flowering we most appreciate them. The present season has been so cold and wet that it is necessary to point out the need for caution in planting. March is not too early, and May is not too late for planting gladioli, provided the conditions are suitable.

In this year of grace, with its unusually heavy March rainfall, those who delay planting are more likely to secure the best results. From now onward, soil and weather permitting, gladioli corms should be planted, either in beds where a low-growing subject is used as a carpeting, or in masses in the flower border, or in drifts in the front of a shrubbery border. But wherever gladioli are planted the soil should be in good condition, and if it was deeply worked and freely manured with decayed manure last autumn, and left rough all the winter, it will be in fine condition to give good results. Gladioli have no objection to fairly stiff soil, providing this is well drained. On light sandy soils there is need for mulching and watering during dry seasons, whereas on the more substantial medium surface hoeing is all that will be necessary, although mulching may be given.

The depth and distance apart at which to plant gladioli corms must depend on the character of the soil and the strength and vigour of the corms and varieties. As a general principle we may allow twelve inches each way between the corms, and a depth of from four to six inches. Some folks advise planting the corms five or six inches apart in rows one foot apart, but while I am well aware that gladioli root deeply rather than broadly, thick planting is not conducive to good effects. It is a common practice to surround each corm with sand at planting time, placing some in the hole before inserting the corm, and some over it before returning the soil. This is very well in heavy soils, and in any case it serves to encourage root action, but it is by no means the matter of necessity so many would have us believe.

After planting there is little to be done beyond weeding and hoeing until the spikes appear in July and August, but then, if the fullest results are to be secured, it is important that every spike receives the support of a neat stake. With a little care it is quite possible to stake every spike securely, giving it one firm tie, without permitting the stakes to be unpleasantly obvious. All too often we have thunderstorms in late summer, and if the gladioli spikes are not staked they are liable to be snapped off by the storm.

Although every credit must be given to Herr Max Leichtlin, Mons. Lemoine, and others for their efforts in the improvement of gladioli, and the creation of new forms, the greatest credit belongs to Messrs. Kelway and Son, Langport, Somerset, who for about half a century have worked wonders with these flowers and raised them to their present high position in the garden. This firm has given us vigorous plants, stately spikes, substantial flowers, and a wonderful variety of colouring, and, fortunately, it has been found that these gladioli are amenable to cultivation in town gardens, though, possibly, they gradually become exhausted under such trying conditions; this, however, need not prevent their culture in towns, providing the cheaper or unnamed varieties are grown. It is not necessary here to give a long list of names of the finest of the varieties, because so much depends on personal taste, but I have been much struck by the great improvements made in late years in the direction of yellow colouring. The present illustration shows a variety named Cloth of Gold that marks a great advance in clear yellow, and it was exhibited last autumn by the Langport firm. Antilco, Bullion, Canary Bird, Davy, Demo, Floradora, Golden Sceptre, Mr. J. M. Skittery, Leader, very fine; Miss Zena Dare, Primrose, Alice Wood, Baron Goldstein, Lacæna, La Parisienne, Miss Warren, Ophir, Pepita, Spicillus, Felicite, and Richard Milner are all beautiful yellow varieties, but some of them are still rather expensive, though others are as cheap as good hyacinths.

C. B.

THE AFRICAN BLEEDING NUN.

But for its comparative tenderness, which compels its being cultivated under protection in all except the warmer parts of the three kingdoms, the African Bleeding Nun or Sowbread (Cyclamen africanum) would be highly valued by all who care for the smaller hardy flowers, so beautiful is it in every way, either when in bloom or when its exquisitely marbled leaves are in their perfect beauty in the depth of winter.

It is, justly, I believe, classed by Mr. J. G. Baker with the beautiful C. neapolitanum, that eminent authority considering it only a geographical form of that valuable species, but in its beauty it appeals to us even more than that, the most reliable of all our hardy cyclamen.

Like C. neapolitanum, it is an autumn bloomer, opening its pretty white, or red-tinted flowers, each with a purple spot at the base, in September or October, these being followed by the leaves, which are not at their best until December, when they are simply exquisite, the greater size giving more beauty than those of the Naples cyclamen, seeing that the marbling is more conspicuous on the dark green ground colour. This will be understood when it is realised that the leaves are from six to eight inches in length and breadth, and that their rounded outline is prettily toothed, and the whole surface ornamented with white marbling on a glossy green ground. Nestling under a tree, a group of Cyclamen africanum is a picture in its season. Unfortunately its hardiness is not commensurate with its beauty, and it is prudent to give it a little protection in winter, either a covering of fern fronds well pegged down, some spruce or other evergreen branches, or a little straw, well secured to the ground, or (preferable to all) a handlight with a piece of matting over it in severe winters. The writer has experimented with it in the open without protection, and, while it might be safe in a moderate season, it was certain to succumb to an unusually inclement one, even in a sheltered corner beneath a tree. He cannot thus recommend it for any place where severe winters are experienced, without any protection. Plants can generally be secured in pots, but dry corms may be planted as soon as they can be obtained.

S. Arnott.

ANNUALS FOR THE GREENHOUSE.

In most gardens where the glass accommodation is limited, and a constant display of bloom has to be kept up in the greenhouse and conservatory, the gardener's resources are usually taxed to the utmost to obtain sufficient plants in bloom to meet requirements, particularly where cut flowers are in constant demand. There are, however, many annuals of easy culture which make charming subjects for this purpose; in fact, there are but few of the soft-wooded plants that may not be treated in this manner; cinerarias, cyclamen, calceolarias, primulas, and the like are all treated more or less as annuals, and in addition to these there are many others that may be grown from seeds in the same way, some blooming a short time after being sown, while others need some months to bring them to perfection.

Take the schizanthuses as an example: if these are raised in the autumn they will not bloom until the spring, while if raised in the summer the plants will bloom in a few weeks. There are, however, some kinds that are more tender, and require the assistance of a hotbed or other heated structure to induce the seed to germinate and grow freely. A few of these are enumerated below, but they by no means exhaust the list.

Lobelia tenuior.

This charming half-hardy annual makes a splendid plant for conservatory or greenhouse. It is of upright habit, having flower stems about a foot high, and sufficiently stout to carry the flowers erect without the aid of sticks. Seeds may be sown in batches during the spring and early summer if a constant supply is required for some time. When grown in the open and in the full sunlight the flowers are dark blue in colour, but in the shade they are of a lighter hue. Seeds sown in the early spring should be pricked off into five-inch or six-inch pots, about half a dozen plants in each. They should be grown on a shelf near the glass, or when the weather is sufficiently warm may be transferred to a cold frame, where, in the mild weather, the lights may be drawn off to keep the plants as sturdy as possible. If well supplied with nourishment when in bloom the plants will give a succession of flowers for a considerable time, and as they become shabby fresh ones may be introduced to keep up the supply.

Nemesias.

All the varieties of nemesias make charming subjects for the greenhouse and conservatory, and if batches are raised at intervals of about a month from early spring a constant supply of plants may be had in bloom through the summer months. The early batches will not even require a heated structure to induce the seeds to germinate, but where they are intended to bloom very early it will be necessary to bring the young plants forward in gentle heat. When the seedlings are large enough prick them off, five or six in a 32-sized pot, and grow them on in a light airy structure until they commence to bloom. During the summer the plants may be grown in the open, and introduced into the conservatory as they come into flower. A batch should also be grown in the open ground for the production of seeds, as these are much better saved from strongly grown plants. The flowers are of various colours; there are, however, several new forms, such as Orange Prince, Blue Gem, and the like, that are quite distinct, and where separate colours are required these are very desirable.

Petunias.

There is an almost endless variety of these, and for richness and diversity of colouring in their flowers, together with the length of time the plants remain in perfection when in bloom, they are great favourites for the greenhouse and conservatory, either in pots or baskets. To grow these well the seeds should be sown in gentle heat in spring, or they may be grown from cuttings if old plants have been preserved through the winter. Seedlings, however, are preferable, and bushy plants may be had in a short time if potted into six-inch pots, but those who are desirous of having large specimens must pot them on into those ten inches or twelve inches in diameter, and peg the shoots down to induce them to break more freely. When established in these, if liberally treated while growing, they will make large specimens in a short time. Smaller plants are more useful for the conservatory, and those grown in six-inch pots will be quite large enough. If a later batch is required a second sowing may be made in May to produce plants that will flower late in the autumn.

Browallia speciosa major.

This very pretty flowering plant makes a fine subject for the greenhouse or conservatory, as its bright blue flowers, which are produced on the tips of the slender growths, are very attractive. Moreover, as the plants are of such easy culture anyone possessing a heated pit or frame is able to raise a batch. For early flowering it is preferable to sow the seeds in the autumn, and grow the plants on the greenhouse shelf through the winter, when, if potted off in early spring, these will flower through the summer. Seeds may also be sown in heat in spring, and as soon as the plants are large enough to handle they must be pricked off into pans or shallow boxes, and placed over a gentle hotbed until about an inch high, when they ought to be potted, three in a six-inch pot. If well looked after these should give a succession of flowers until the cold weather sets in. Browallias like a light, rich soil, with a fair amount of warmth while growing, but when in bloom the temperature of an ordinary greenhouse suits them admirably.

Coleus thyrsoideus.

Though this plant may be readily propagated by cuttings, like other members of the same genus, it can also be raised freely from seeds. When well grown, the long tapering spikes of rich blue flowers are very attractive, especially through the dull winter months. Seeds sown in spring should be placed in gentle heat, and when the seedlings are large enough they must be potted in small pots and returned to a heated pit until established. When the pots are filled with roots give the plants a shift into those of five inches or six inches in diameter. As the weather becomes warmer they may be transferred to a cold frame for the summer, pinching them back once or twice to induce the plants to become more bushy. As the autumn approaches they should be removed to a warmer structure, where they will soon commence to send up their terminal flower spikes.

Torenias.

There are several torenias that are well worthy of a place in all gardens. Years ago one was accustomed to see the old Torenia asiatica exhibited in a collection of stove and greenhouse plants. Now, however, torenias are treated as annuals. Sown in heat in early spring, the seeds soon germinate, and in the course of a few weeks the seedlings are large enough for pricking off, which should be done as soon as the plants have made a couple of rough leaves. When about an inch high prick them out, three into a six-inch pot, in light, rich, sandy soil, and return the plants to a gentle hotbed, where they will make rapid growth. The points of the shoots should be removed when the plants are about two inches high, to induce them to break freely and make bushy specimens. If this operation is repeated two or three times, and the roots are liberally supplied with moisture, in the course of a few weeks they will be a mass of bloom. T. Fournieri grandiflora is one of the best, as the light blue flowers harmonise so beautifully with the deep purple blotches and yellow throat. T. Bailloni has yellow blotches and purple throat.

GLADIOLUS CLOTH OF GOLD.
Flowers citron-yellow, with rosy-yellow lower segment.

Exacum macranthum.

Though by no means a new plant, as it has been known to gardens for more than half a century, this is rarely seen, and certainly is not known so well as it deserves to be. There is no winter-flowering plant that is more attractive, and certainly none more worthy of a place in our stoves or warm greenhouses. The flowers, which are produced at the ends of the growths, are of a deep, rich, dark blue, about two inches in diameter, and form a peculiar contrast to the bright yellow stamens. In shape they much resemble the gentians, to which they are closely allied. Seeds should be sown in spring, in a light, peaty, sandy soil, and be placed on a hotbed. When the seedlings are large enough to handle they should be put into small pots, and returned to the hotbed, and when the soil in these becomes filled with roots place three in a six-inch pot, as by so doing nice bushy specimens may be produced in a short time. The plants should be grown in a heated pit throughout the summer, and they will commence to bloom in the autumn, continuing in flower through the winter.

H. C. Prinsep.

BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in The Amateur's Greenhouse, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

THE WILD GARDEN—III.

Numbers of the stronger-growing herbaceous plants are well adapted to naturalisation, especially if the ground be well prepared and enriched before they are put out. The common crimson pæony, P. officinalis, is effective when planted in groups in the grass; the acanthus, with its giant arching leaves is always a noble object, and the Japanese anemone succeds well at the edges of woods. Arundo donax, a great reed fifteen feet or more in height, with blue-grey foliage, is a handsome subject, as is the pampas grass, and the somewhat similar, but more graceful, New Zealand reed, Arundo conspicua. The more vigorous species of the perennial aster, or Michaelmas daisy, are quite at home in the wild garden, and the bamboos, with their tapering shoots and feathery foliage, are always attractive. Some of the more robust of the campanulas will do well, such as C. latifolia, an English plant, C. rapunculoides, and others. Crambe cordifolia, with bold foliage and tall flower heads, composed of innumerable tiny white blossoms, is a striking plant, and the perennial delphiniums are valuable for their tall blue bloom spikes.

A CHARMING EFFECT PRODUCED BY BLUEBELLS IN THE QUEEN'S COTTAGE GROUNDS, KEW.

In a sheltered site the tall Eremurus robustus makes a noble picture, and the giant sea holly, Eryngium pandanifolium, with spined leaves six feet in length, and flower stems ten feet in height, is fine in contour, and has been grouped effectively in the wild garden in the south-west. Heracleum giganteum, the great cow parsnip, will quickly overcome all surrounding vegetation, and rear its huge white flower umbel to a height of ten feet above its handsome foliage.

Other good perennials are the globe flowers, trollius, for damp spots, day lilies (hemerocallis), Ænothera Lamarckiana, onopordon (the cotton thistle), Polygonum cuspidatum, and P. sachalinense; the great Oriental poppy (Papaver bracteatum), solidago or golden rod, tritomas, the mulleins or verbascums, yuccas, Ranunculus aconitifolius, Monarda didyma (the bergamot or bee balm), German irises, hypericums of the stronger sorts, Inula glandulosa, herbaceous spiræas, Ferula Linki, the perennial sunflowers (helianthus), while white foxgloves are unexcelled for wild garden planting, vistas of snowy spires thrown into strong relief by a verdant background forming a delightful picture.

The beauty of the wild garden may be much enhanced by the judicious planting of flowering shrubs and trees, some of which will add brightness to the landscape for eight months out of the twelve. The prunus family is particularly ornamental. P. Davidiana alba, and its pink form, often flower in January. The purple-leaved P. Pissardi bears its white blossoms in March, and P. triloba flore-pleno is a lovely little tree with rose-coloured flowers. P. amygdalus nana is a dwarf shrub with pink blooms, and many others of the race are very attractive. Amelanchier canadensis is a charming sight in the early spring, when its countless white flowers are contrasted with the amber-brown of the young foliage. The berberis also has many handsome species, such as B. Darwini and B. stenophylla, while B. Thunbergi turns crimson in the autumn. The white-flowered Choisya ternata is practically hardy, as is Olearia Haasti and several other species, such as O. macrodonta, O. nitida, and O. stellulata, can be grown in the warmer localities.

The cistuses are especially good shrubs for light soil, and the scarlet thorn, with its double variety, is well known to all. Eucryphia pinnatifolia is a beautiful tree bearing a profusion of large white flowers in August, and is fairly hardy, while Exochorda grandiflora, the pearl bush, with its white flowers, is an exceedingly attractive sight in the spring, and in the autumn the Venetian sumach, Rhus cotinus, is effective with its clouds of feathery purple. Pavia macrostachya is another good autumnal tree, bearing white, chestnut-like spikes of bloom in August. Cornus mas, the Cornelian cherry, is a pretty little tree bearing in February and March tiny yellow flowers on its leafless branches. Brooms are very valuable for light ground, the pale sulphur Cytisus præcox, the golden C. scoparius, and its crimson and yellow variety, C. Andreanus, with the white C. albus, being very decorative.

Several of the deciduous magnolias are available for wild garden planting, and the lilacs (syringa), the diervillas or weigelas, the yellow-flowered Forsythia suspensa and F. viridissima, Garrya elliptica, with its long, hanging catkins, Halesia tetraptera, the snowdrop tree, Xanthoceras sorbifolia, the shrubby spiræas, of which there are many most attractive species, Kerria japonica and its double form, Rhodotypos kerrioides, sometimes known as the white kerria, and the flowering currants (ribes) should all flourish where sites are chosen specially for them.

The graceful abandon of climbers adds much to the beauty of the landscape, and these plants should be largely used in the wild garden. There are few prettier sights than Clematis montana veiling a tree forty feet high with its ivory-white flowers at the close of May. C. balearica or calycina grows rampantly in the south-west, and commences to bear its white, purple-spotted flowers in January, while C. flammula, C. paniculata, and C. graveolens are also available. Most species of honeysuckle are at home in the woods, and Polygonum baldschuanicum is unrivalled for growing at the foot of an old fir, which in the summer it will smother with its large flesh-pink bloom clusters. Climbing roses of the more vigorous sorts will readily clamber into trees, and few prettier pictures can be imagined than an old apple tree whose head is shrouded by rose blossom. The white jasmine will also succeed under like circumstances, as will the wistaria in an open and sunny situation. Muehlenbeckia complexa is perfectly hardy in Devon and Cornwall, and will drape a cliff for a height of forty feet or more with its black stems and tiny rounded leaves, while in the vines we have foliage of the most ornamental description, which in many species, such as the noble Vitis Coignetiæ and V. Thunbergi, assumes a gorgeous autumnal colouring.

S. W. Fitzherbert.

Filberts and Cobs.—Where these are much appreciated it should be the growers aim to get the nuts as fine and large as circumstances will permit. In Kent and some of the southern counties the bushes are extensively grown, and yield, almost annually, excellent crops, which, from a financial point, are very profitable. The bushes are trained basin-shape, and are well pruned annually, from the middle of February and onwards, according to the quantity grown and the time the male catkins open. When pruning, keep the centres well open, spur back some of the stronger growths, and encourage a quantity of twiggy branches to produce plenty of tiny pink blooms. All suckers should be grubbed, and the land be kept free from weeds, etc. Do not over-feed with rich manure, otherwise the bushes will grow too strongly to be fruitful, and nuts like a sweet sandy loam, and a somewhat sheltered position. Young plants selected for new plantations should have a clean stem about 15 inches from the roots to the lower branches, and the individual shoots to form the future bush should be as equidistant as possible. When pruning, make the cuts so that the terminal shoots are produced from an outside bud. If this be practised annually, the bush will grow into the desired shape, and as it increases in size other branches may be allowed to grow so that, instead of five or six shoots, as at the commencement, there will be fully double that number by the time the bush is seven feet high.—H. Markham.

LETTUCES.

Throughout the year the lettuce stands pre-eminent as a salad plant, and during the summer months it is very largely used in almost every household. During hot weather it is very appetising, and, fortunately, this is the season of the year when it can be produced in plenty. The late winter and early spring months are the most difficult times in which to obtain it in anything like large quantities, unless skill and appliances in the way of pits and frames are used.

The earliest cutting of young lettuce is best produced by making a sowing in pans or boxes very early in the year, in a temperature of about 50 degrees, and the plants grown on sturdily near the roof glass, where the maximum amount of light can reach them. When they are large enough prick them out at about eight inches apart in a frame, in porous soil, over a mild hotbed, which is made principally of leaves, and trodden firmly. This retains a steady, lasting heat, conducive to forcing a firm desirable growth. Ventilation to the frame is only required to a limited extent during early growth, but a genial atmosphere may be kept up by the evaporation from the hotbed. By this method valuable small heads can be procured in March; when the plants have attained a usable size afford more air to the frame, and so prolong the crop.

G.M. 275.

VIEW IN WILD GARDEN, SOUTH LODGE, HORSHAM.

The selection of suitable varieties is an important factor in bringing about success or otherwise for the different seasons, and the frequent sowings that have to be made during the year. All the Year Round, Golden Ball, and Earliest of All are good varieties for this early sowing, and also for the next, which, under the same conditions as the last, should be made in February, and the plants grown steadily. When large enough they may be pricked out in a frame similar to the early plants, but without the aid of the hotbed. These will form a succession to the above if they are kept in a rather confined atmosphere until the plants are well established, when air may be more freely admitted as the weather allows.

A March sowing should also be made in a frame to provide a batch of plants to plant out in a high sheltered border to succeed the frame supply. For the April sowings there will be no need for protection, and they should be made in the open; in fact, towards the end of the month the reverse order of things will have to be considered, by making plantations in the most exposed part of the garden. The tops of celery ridges are excellent sites for early summer crops, but in any case the ground should be rich and deeply tilled. Unless there is a special preference for the cabbage varieties of lettuce the Cos type is the better for summer use, the leaves, being of thicker texture, remain crisp longer when cut.

During the summer private families are often in town, and the lettuces have to be packed and forwarded; if properly tied up and the whole leaves kept intact, the Cos varieties will arrive in a much more satisfactory condition than the cabbage varieties. An ideal early Cos lettuce for this purpose is Little Gem (Dickson and Robinson). It turns in quickly, with self-folding leaves, is very solid and profitable, and blanches easily. Champion White, London White, and Balloon are all good and serviceable for sowing up to the end of August.

The July and August plantings should be made in the most moist and cool part of the garden. If the weather is hot and dry no crop will repay better the labour of giving the plants a thorough watering, and a top-dressing of spent mushroom manure or mowings from the lawns to the depth of about an inch will also be of the greatest assistance in promoting good growth. For the September sowings a protected situation has to be chosen, such as a south border.

If a winter supply is expected a corresponding provision has to be made by sowing not later than the second week in September, to allow the plants to become of sufficient size before autumn frosts check their progress. When the plants are about an inch high they should be thinned out to eight inches apart, and the spare plants planted in pits and frames to become established, and in readiness to be covered with lights in November, when the severity of the weather makes this necessary. Rows may also be planted at the foot of south walls or other sheltered positions. Sugarloaf, Bath, All the Year Round, Hicks' Hardy, and Stanstead Park are all hardy and good varieties, but the last-named is, in my opinion, far the best for giving a constant and unfailing winter supply. If the plantation in the border can be protected with lights, useful heads will be produced up to Christmas.

Those in pits and frames may be lifted and blanched in the mushroom house, in batches as required, during the months of January and February, while the plants from the rows planted under the walls may be blanched by placing six-inch pots over them a fortnight previous to cutting.

The past winter has not been exceptionally severe, and the plants that have come under my notice have wintered well and produced good heads, especially the variety recommended, which, to some extent, goes to show its hardiness and suitability to those who have to face the sometimes difficult problem of providing lettuce in and out of season.

C. Flack.

Cholmondely Castle Gardens.

THE CARE AND MAINTENANCE OF THE LAWN.

It is not too much to say that the well-kept lawn is one of the most important features of the garden, contributing to our enjoyment not only as a setting to the flower garden and shrubberies, but also for use in the various summer games indulged in, in this country.

A badly kept and weedy lawn is an abomination, and no matter how perfect a lawn may be when first laid down and established, unless prompt action is taken in the extermination of weeds when first seen, the renovation of portions that have become thin and sparse through a variety of causes, and constant attention to mowing and rolling, it will rapidly deteriorate and lose its character. I have noticed many amateurs engaged in the spring months in the work of lawn renovation, and despite the advice proffered in these columns they will persist in sowing the seeds on the surface and then scratching the ground as if they were afraid of injuring the seed, and the result is failure.

The work should be done in a very different way, the portions to be sown being deeply dug, adding a small quantity of short manure; then it must be thoroughly solidified and rolled, and then the seeds may be sown evenly and thickly over the whole surface, followed by an energetic raking with an ordinary hay rake and another rolling which will complete the task. The lusty sparrow is very fond of the seeds, and unless black cotton is suspended on sticks about four inches from the ground the birds will spoil a great quantity, but happily this ruse is effectual in bluffing them.

As regards after-treatment the new lawn should not be cut so closely as old turf for some weeks, and in passing over it the handles of the machine should be slightly lowered, thereby removing about half the length of grass. To renovate a lawn with turf is a much more expensive business, but where outlay is no object and really good pasture turf, free from rank weeds, is available, it is certainly preferable, and may be put down at this season with perfect safety. It is a good plan to thoroughly examine the turf prior to laying it as weeds are then readily removed.

Weeds on Lawns

will soon make their presence known, and the deep-rooted dandelion has already become active, and only needs a few warm days to develop its perfect inflorescence, and unless checked, to scatter its seeds broadcast. The recent heavy rains have thorougnly moistened the soil to a good depth and made the matter of eradicating these weeds, together with others of rank growth, an easy matter. In removing the first-named with a spud, a considerable portion of the root will be detached; still, unless the hole is filled up with salt, the remaining portion will throw up a dense crop of growths. The plantain is an inidious wood, as it almost imperceptibly fills the lawn if left unchecked for a season. Its prostrate habit will account for this, and one often sees hundreds of the seed stems among the grass maturing and doing their best to destroy the beauty of the lawn. I hardly think the wild ranunculus is a much less sinner, as where allowed to become established it completely ousts the finer grasses, and trails along with great rapidity. Plenty of people raise their voice on behalf of the daisy and think it a great pity to exterminate it from the lawn, but as it creates weedy patches and detracts from the appearance of the grass it must be relegated to the meadow in company with the ranunculus.

Moss, too, is not by any means desirable, and renders the work of cutting very laborious, and it is a matter for surprise that it is allowed to grow seeing how easily it is destroyed. Provided it is well raked out in the autumn and a heavy dressing of rotten manure applied, followed by a heavy dressing of lime and soot in equal quantities in spring, it will be conspicuous by its absence, and this leads me to say that an impoverished condition of the soil, together with improper drainage is responsible for its appearance.

It would be well if everyone would bear in mind that in mowing the grass each week throughout the summer, and carting away the grass to the rubbish heap, the plant-food of the soil is being removed, and that unless annual top-dressings are afforded, especially on light land, the lawn will assuredly deteriorate. Personally I am a strong advocate not only of an autumn dressing of animal manure, but a spring dressing of nitrate of soda or sulphate of ammonia, not forgetting that a lengthened drought considerably weakens the finer grasses, hence the necessity of artificial watering at such times, and for small gardens there is nothing better than the revolving sprinklers which evenly distribute the water over the whole surface, and by their steady action thoroughly moisten the ground.

Where there are big areas of grass and it is impossible to water the whole, I would recommend that the grass be cut without the box in times of extreme drought, as by so doing the cut portion affords grateful shade to the roots, and, further, is invisible an hour or two after the operation.

Walter H. Aggett.

CARE OF GARDEN TOOLS.

It does not require a very keen eye to discover whether the garden tool shed is in keeping with the other parts of the establishment, for when one sees a rusty spade left in the celery trenches, water pots pushed in any out of the way place, the lawn mower left in the shrubs close to where it was last used, and the hose pipe left out in all kinds of weather, there must be something lacking on the part of those in charge. To let men leave their tools about in this manner at once shows a lack of interest on the part of the gardener, for he alone is to blame for such slovenly habits. The first thing to be instilled into the minds of young men when engaging them is tidyness in everything, from the stokehole and potting shed to the plants in the conservatory or flowers in the mansion. If one finds tools left about uncleaned, after due caution, my advice is to get rid of the delinquent, as he will never make a tidy gardener.

A word or two must be written about watering cans, though these do not form such an important part in gardening as they did in days gone by, as their place is in a great measure taken up by the standpipe and garden hose. Still they must be used in all gardens, both large and small. Many, however, are not required during the winter season, and these should receive a coat of paint both inside and out, and be turned up, so that it is not possible for any water to lodge in them. Rust soon eats its way through the thin coating of tin when the cans are allowed to stand about in all weathers, therefore the cans should be hung up in a dry shed.

H. C. P.

TIGRIDIAS AND THEIR CULTURE.

The tigridias are perhaps the only bulbous Irids from America that have stayed with us since Dean Herbert's time; other genera have had a shorter sojourn and have been neglected by gardeners, or have found their proper home in botanic gardens where a plant need not be perpetually in flower to please.

The huge gorgeous flowers of the old T. Pavonia attracted greater attention from the first, and, despite its fugacious character, and colour scheme suggestive of an amateur artist's palette, it found hosts of admirers. It has improved somewhat under cultivation if one may judge from earlier paintings, and now gives us flowers five inches across, scarlet petalled—the petals uniting to form a shallow basin of orange-yellow most unmistakably spotted with scarlet, also grandiflora or speciosa is just an improved Pavonia—the petal limbs more rounded, broader, and of a deeper scarlet, whilst the colouring is a little less crude; lilacina is equally large but entirely different in colouring. Here the petals are of a dark lilac-rose, the base white, spotted with dark red. It is splendid when it first opens, but later in the day the lilac tint becomes dominant, and it loses much of its attractiveness; alba, the white Pavonia with crimson-spotted cream-coloured base, and alba immaculata, are lovely flowers that the artist can appreciate, the latter variety has no spotting whatever, but the base is slightly chrome-tinted.

The smallest varieties are the most refined. Conchiflora, the Mexican Shell flower, pale yellow, with a basin literally crowded with crimson spots; aurea, [illegible] gold with purple spotted base; lutea immaculata, pale yellow and unspotted; and rosea also self-coloured, are the gems of the genus. These lesser tigridias lack the vigorous constitution the giants possess. They are plants for the specialist, who would delight in their exquisite form and soft refined colouring. Pavonia, lilacina, alba, grandiflora, and immaculata will suit the gardener better, their flowers are larger and held well above the foliage, and those that have colour have it in plenty. They look far more interesting planted in mixture than in colour blocks, and the giant varieties accentuate the purity of the whites.

I cannot recommend tigridias for the mixed bulb border; they should have a special site, choosing a light soil, and depress the bed below the general level. They will start freely in quite ordinary soil normally moist, but after the second and third leaves are developed they enjoy an occasional flooding. It does not matter if the border is as wet as a swamp for a week or two at midsummer, they will enjoy it the more provided they have started well. One gets grander leafage, finer and stronger flowers for a longer period, and ultimately bigger bulbs at the end of the season than is possible under ordinary treatment. Winter storage is a vexed question with tigridias.

There is always a wastage of bulbs left in the ground, due to frosts, damp, decay, and more often to mice. One cannot do better than lift them when the leaves change colour, fill a box or flower-pot with wet mud, plunge the bulbs in it and allow all to dry. The bulbs, when taken out of their mud casing in spring, are quite fresh and plump.

G. B. Mallett.

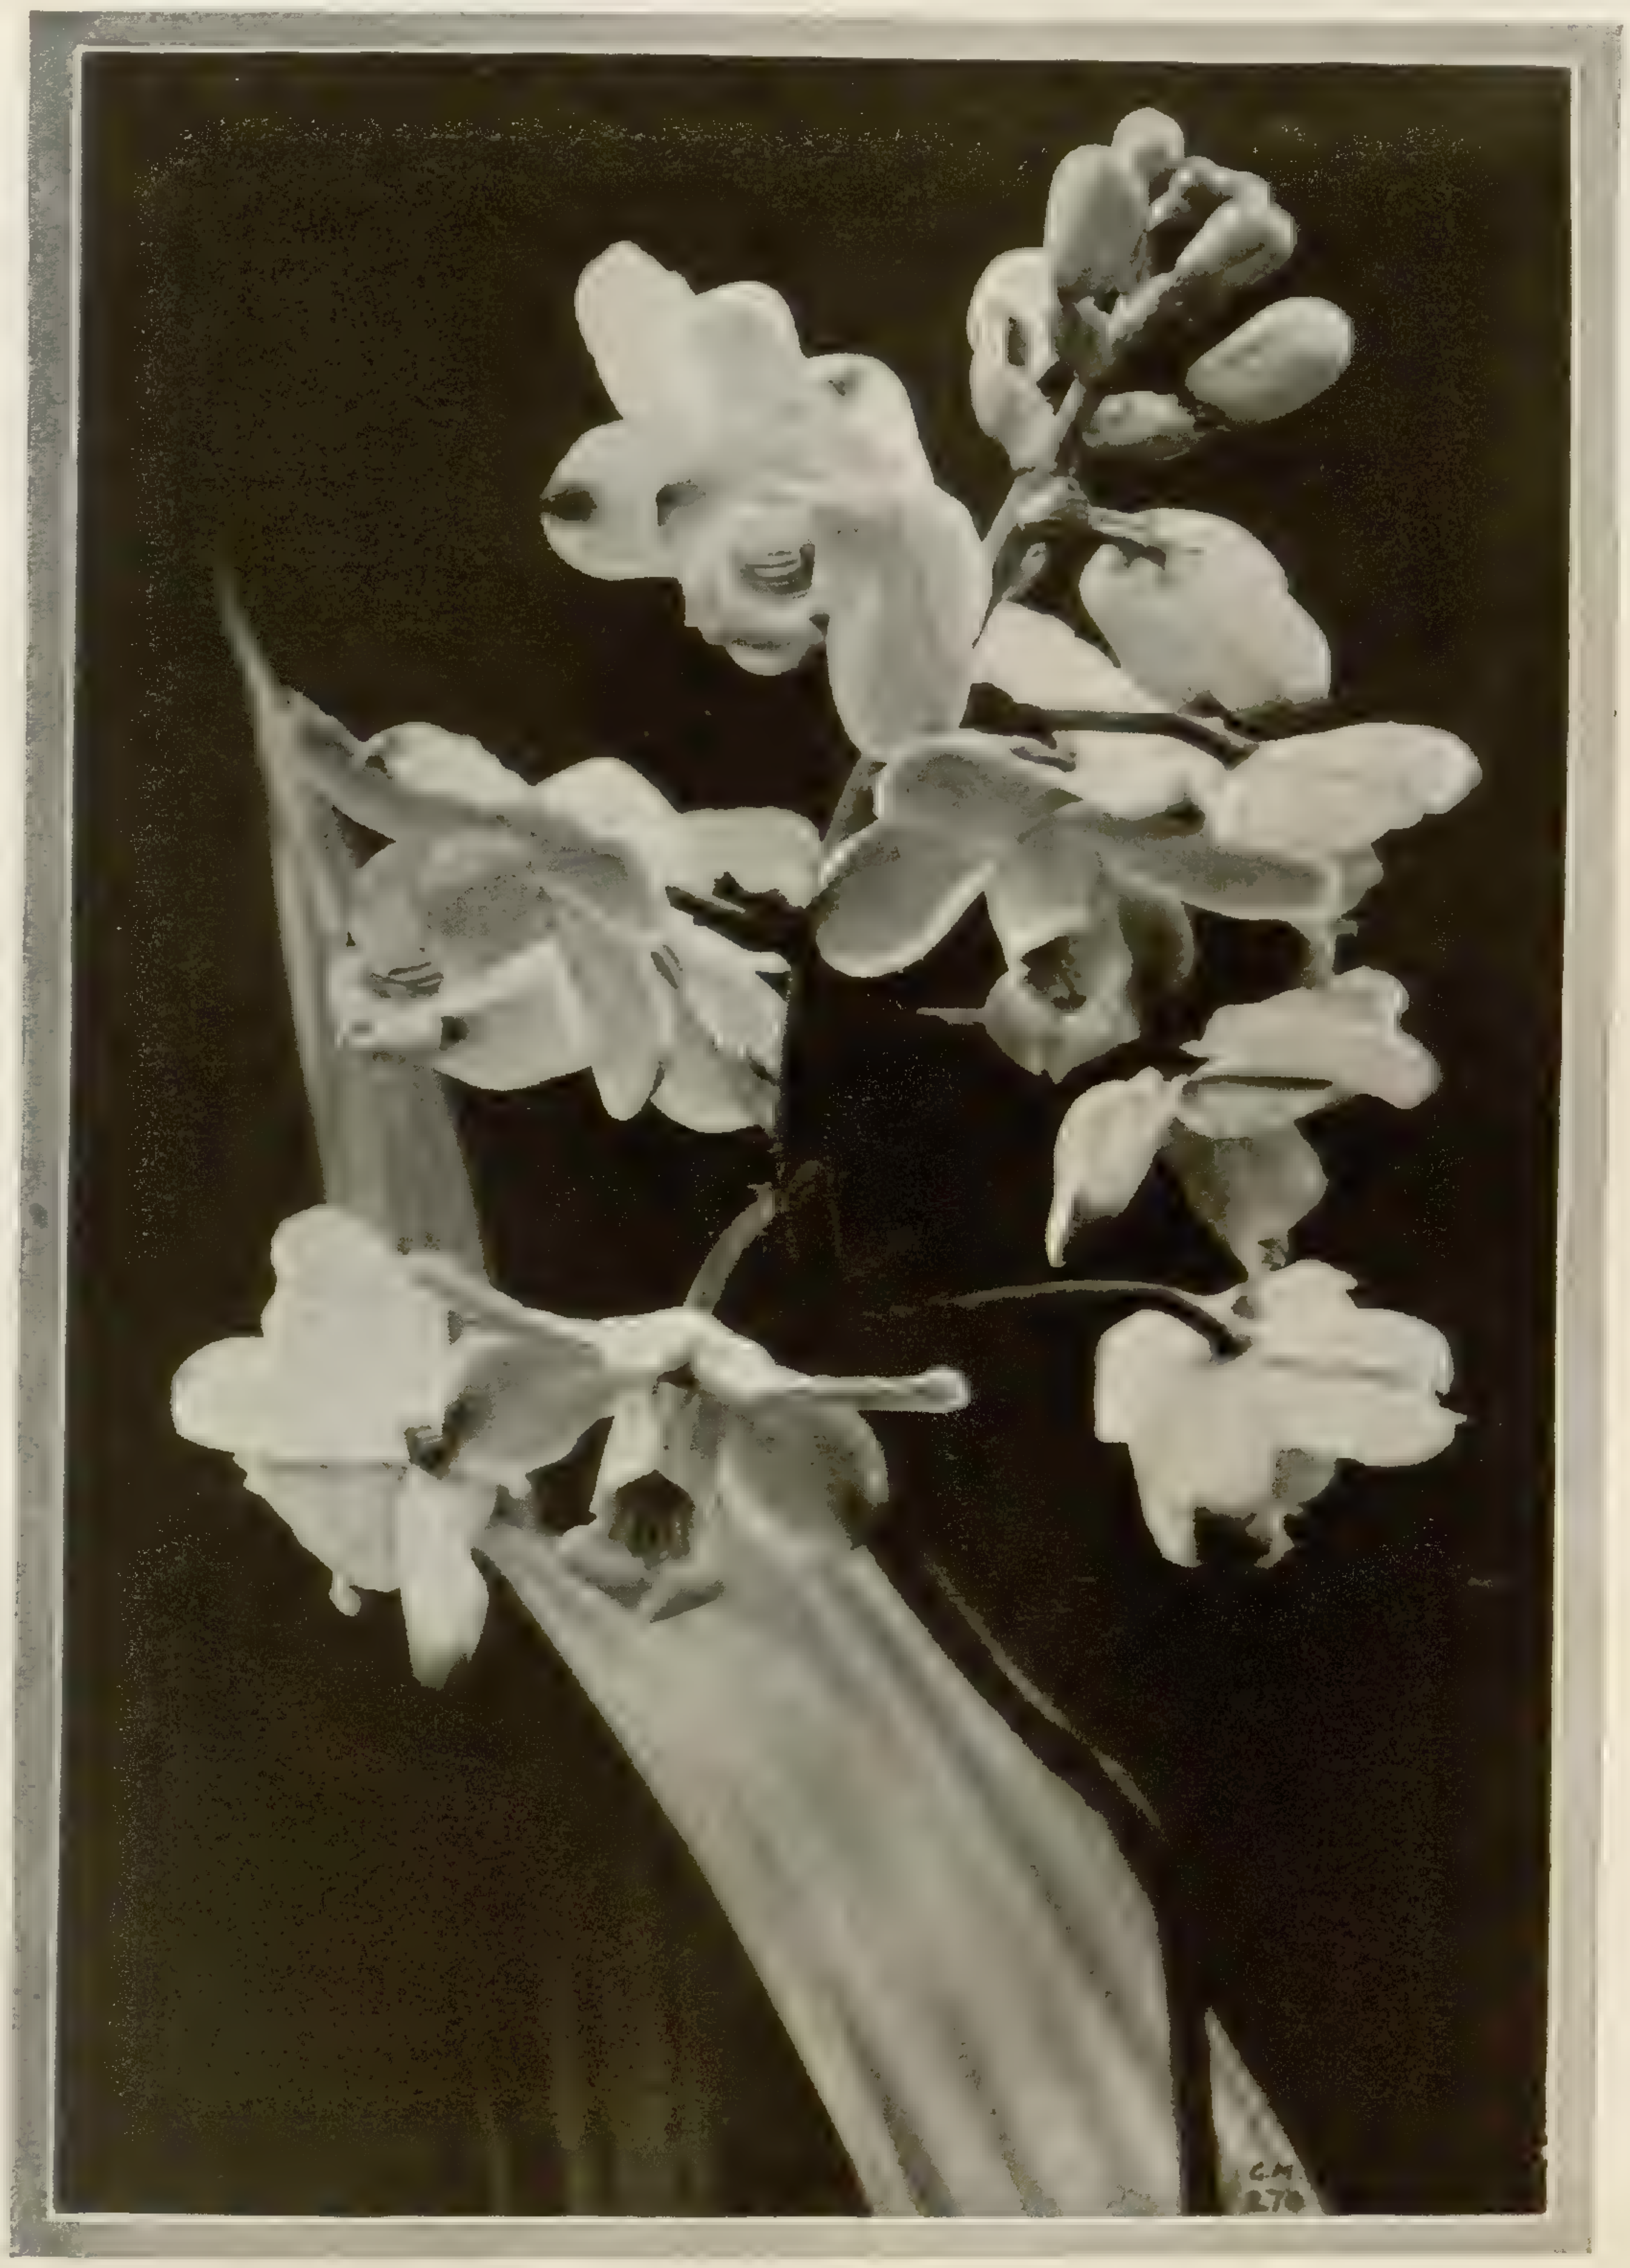
EULOPHIELLA PEETERSIANA.

A fine specimen of this strikingly handsome orchid is at present in flower at Kew in a warm house. When first exhibited in 1898 before the Royal Horticultural Society by Sir Trevor Lawrence, Bart., Dorking, this species created quite a sensation in the orchid world, and the Orchid Committee awarded it a First Class Certificate.

The Kew plant is in vigorous condition at the present time. Early in January it commenced to push up two strong inflorescences, one of which was removed at an early stage. The other one has now reached a height of four feet three inches, the top of which is shown in the accompanying illustration. The lower flowers are three and a-half inches in diameter, but the blooms gradually become smaller as the raceme extends. In colour they are a lovely rose, shading to rosy-purple near the tips of the perianth segments. The lip is white, margined with rosy-purple, and with three to five erect yellow crests. The throat is white, with several lines of yellow extending nearly to the base. The leaves are plicate, bright green in colour, arching towards the top, the largest being four feet two inches long, and four and three-quarters inches broad, and tapering towards both apex and base.

The conditions under which this orchid thrives are those of the East Indian House, where the conditions are hot and moist. The compost used is a mixture of sphagnum and peat, and the plant has never been allowed to become dry at the roots at any time of the year. Heavy shading was provided during the summer months, but full exposure given at other seasons.

Kew. C. P. Raffill.



EULOPHIELLA PEETERSIANA.

Flowers large and fleshy; rose and rose-purple, with a white, yellow-crested lip.

PERPETUAL CARNATIONS FOR PRIVATE GARDENS.

The bench system of culture may answer for the market grower, but pot culture is the most convenient for the private grower, as he may require some of the houses for other occupants during the summer months, and the plants are also more easily handled in pots, if space is limited. Carnations, from the cutting to the time they have finished flowering, should be manager by one man, for, as with many hard-wooded subjects, "too many cooks spoil the broth," so it is with carnations.

The atmospheric moisture required, and careful watering, especially during the winter months, are two cultural details which require careful attention. It is more than probable that the dreaded "rust," to which some varieties are subject, is largely induced by negligence or ignorance in these two matters. Many varieties seem immune from "rust," but I am fully convinced that varieties which are affected by it are at their worst when an excess of moisture is permitted. This was particularly noticeable during last October and November, when there was an unusual rainfall and a heavy moisture-laden atmosphere. Of the variety Mrs. Burnett, which is subject to "rust," our first batch of this variety to flower was rather badly attacked, but with drier surroundings we soon checked the progress of the disease, and since then other plants of Mrs. Burnett have shown no more "rust" than many of the Americans.

Disease appears to be constitutional with many varieties, and greatly aggravated by local influences, for I have plants side by side, some affected and others perfectly free. We need to work from those varieties which are immune. T. H. S.

THE INFLUENCE OF INARCHING.

The operation of inarching is frequently practised in vine culture as a means of either establishing quickly a young vine on an already established one, so as to bring it into fruiting without loss of time, or to counteract some defect which one variety may possess as compared with another.

I may safely assume that there are few gardens where the Madresfield Court grape is grown, in which, in a greater or lesser degree, the berry-splitting propensity of the variety is not known. This cracking or splitting of the berries has been attributed to several causes, and many remedies have been advised, in some cases effective, in others ineffective. Why the berries of this vine should crack in one garden and not in another, under apparently the same system of culture, is not the object of this note; much ink has been spilt over it, and we are no "forrader."

Several seasons ago, wishing to have a Madresfield vine in an early house, and to bring it into a fruiting condition as quickly as possible, I inarched some rods on a Black Hamburgh vine, and hoped the inarching would prevent cracking. This hope was not fulfilled, in fact there was more cracking on the Hamburgh stock than in the case of the Madresfield Court on its own roots. The experiment has not been successful, and I prefer to keep Madresfield Court on its own roots, as it then gives finer berries, and bunches with a normal amount of berry splitting. The berries from the inarched vine were much smaller than those from Madresfield Court on its own roots. It should, however, be noted that Madresfield on its own roots grows extra strong here, whereas Black Hamburgh is one of the weakest growers; another instance of soil influence.

A vine which does show the beneficent influence of inarching, and which is apparently improved in quality and appearance, is the variety Melton Constable. This vine, on its own roots, too closely resembles Gros Colmar, and if the latter variety is one of its parents, it must have been the predominant partner. We have Melton Constable inarched on Black Hamburgh, and also on Alicante. Growing on the latter variety it appears to give the best results in colour and flavour, and so grown is preferable to Gros Colmar on those two points.

While inarching enables one to fruit a new variety more quickly than might be the case on its own roots, a careful selection of stock for the scion appears to be desirable. T. H. Slade.

Poltimore Gardens.

HISTORY OF THE GHENT FLOWER SHOWS.

In view of the fact that the Société Royale d'Agriculture et de Botanique de Gand will, in a few weeks hence, celebrate its centenary, and a number of British horticulturists will take part in the great exhibition and other functions associated with the celebration, a few particulars of the development and work of the society can hardly fail to prove of interest.

In the opinion of Mr. A. Ceuterick, the secretary general, it would be a mistake to suppose that the society owed its origin to a fraternity or guild of gardeners of the old school, as in the case of so many societies associated with the professions that have sprung from existing bodies of workers. There has long existed in Ghent a taste for horticultural and floricultural products, and it would appear that about the year 1622 Bishop Triest, who was long known for his interest in art and taste for flowers, formed a brotherhood of gardeners, with St. Amand and Ste. Dorothée as the patron saints. In addition, a society of amateurs was founded at Ghent in 1669 by Abbot Reyntkens, who was devoted to horticulture, and wrote a book thereon, which was published in 1675. These two fraternities did excellent work in the encouragement of horticulture, but, as in the case of all the other organisations, they were suppressed by the decree of August 18, 1792. Notwithstanding this, the taste for flowers continued to increase with the prosperity of the community. The number of gardeners in the employment of the large landed proprietors and the wealthy amateurs rapidly increased, and little by little commercial cultivators, half florists and half market gerdeners, became established about Ghent.

It was chiefly along the Conpure that the establishments of these latter were met with. Even after the great changes in this part of Ghent the horticultural establishments remained. The old establishment of Linden had not been turned into building ground, and a new street—Liévin de Winne—been formed thereon, and on the left-hand side of the river, behind the Salon Napoleon, there was a large open space available for cultural purposes. At the commencement of the 19th century there was, on the right-hand side of the river, and at the point where the passage of the Conpure joined the paved roadway, a public-house, bearing the sign, "In Frascati." It was occupied by a gardener, and his fellow gardeners, of whom there were considerable numbers in the neighbourhood, were the principal customers. A goodly number of amateurs also visited the house for the purpose of meeting those having tastes similar to their own.

About this time England, favoured by the increase of her colonial possession, and the development of her commercial relations with foreign countries, was making rapid progress in horticultural matters. New plants were being introduced almost without ceasing, and immense improvements were being made in cultural methods. The nursery trade in England had become of considerable importance at the commencement of the 19th century, the nurserymen issued catalogues of the plants, etc., they had for sale, and these were distributed throughout the European continent. By the catalogues and other means, information as to what was being done in Great Britain reached the horticulturists in and around Ghent. Their curiosity was aroused, and from time to time amateurs, private gardeners, and nurserymen, made a journey to England both to purchase novelties and to learn something about the advanced methods of culture. It is not difficult to imagine the interest with which the return of the fortunate travellers was anticipated, or that there was a full house in the evening of their return to their usual position among their friends at the Frascati.

It was at one of the meetings at this inn that the Société Royale d'Agriculture et de Botanique had its origin. On October 10, 1808, Frans Van Cassel, who had returned from England a short time previously, described to his friends what he had seen in England, and he proposed that a society should be formed at Ghent for the purpose of organising exhibitions of flowers, etc., with a view to assist the development of commercial horticulture and a love for flowers in the city. The proposition was received with enthusiasm, and at a subsequent meeting Avocat Lebèque one of the principal judges and a distinguished amateur horticulturist, was requested to prepare the rules. The rules having been prepared, they were, in conformity with the law, submitted to the Mayor, M. Pycke, and duly confirmed. Of the forty-seven persons who assisted at the foundation of the society, eighteen were gardeners, and the other founders included architects,doctors, lawyers, hosiers, plumbers, painters, and a police commissioner. The first officers were: President, Van de Woestyne, a member of one of the great Ghent families; secretary, M. Lebèque, advocate and judge; and treasurer, M. Goethals, advocate.

The objects of the society, and the means by which they were to be effected, were defined in the second and fourteenth rules. In the first of these it is declared that the objects were the extension of a knowledge of botany, and the improvement of the methods of cultivation of indigenous and exotic plants. In the fourteenth rule it was stipulated that there should be a public exhibition annually of flowers and shrubs in one of the rooms in the garden of Frascati and that the exhibition should be announced in the "Gazette de Gand" eight days in advance. To render the exhibition interesting and useful, each member was required to send two pots containing plants, flowers, or shrubs, or pay a small fine. Members could send more than two pots, but not more than six. The arrangement of the exhibition was made by five specially appointed commissaires, and the members had to accept without murmur the position in which their plants were placed, or pay a fine.

In carrying out its programme the society held its first exhibition at "In Frascati," February 6, 1809. This proved most gratifying to the promoters, and the subsequent shows were so successful that in 1815 it was found necessary to provide more room for them. It was then arranged to hold them in the garden of "In de Zaal Flora," a public-house in the Rue de la Caverm, and a spacious building was specially erected for the purposes of the shows. Three years later the King evinced a warm sympathy with the objects of the society, and the committee asked him to permit them to add Royale to the title, and grant them a coat of arms, and he at once granted the requests. The coat of arms was composed of a watering pot, spade, rake, and other gardening tools, with the motto, "Veneficia mea, Quirites; haec, sunt."

The society continued to prosper, and, with an increase in the membership and in the interest in the exhibitions, these latter increased so rapidly that in 1827 much more space was required for the display of the products. By a resolution of the City Council the vestibule of the Hotel de Ville was placed at the disposal of the society. In the years 1830 and 1831 the exhibitions were held in St. George's Hall, but in 1832 the society returned to the Hotel de Ville, where it remained until 1836, except that in 1834 it held its exhibition at the Palais de l'Université. The continuous growth of the society and the enormous expansion of the shows induced some of the members to seriously consider the question of obtaining a home worthy of the high position to which the society had attained. A company was formed for the purpose of providing a new location of a suitable character, and it was fortunate in having presented to it the site on which the Casino, with its gardens, now stands, and this, by the way, is near the birthplace of the society. Continuing its career with unabated prosperity the society erected in 1866 the magnificent winter garden with which visitors to the quinquennials held since that year are familiar. Recognising the fact that increased space would be required for the centenary exhibition, a new building was added to the existing structures in 1906.

The Société Royale d'Agriculture et de Botanique de Gand has throughout the hundred years over which its history extends held an exhibition annually; but many years ago it decided to hold every fifth year an exhibition on a greatly enlarged scale, and of an international character, and these great gatherings have had unvarying success. They have had the effect of bringing to Ghent every fifth year many hundreds of the leading horticulturists from all parts of Europe, and making the city famous for its horticultural products. In 1884 the society organised the first International Chrysanthemum Show held in Belgium, and since that year it has held other excellent shows of a national character.

The society has by no means confined its attention to the holding of shows. Within a few years of its foundation, close attention was given to the many important questions relating to agriculture, arboriculture, fruit culture, market gardening, and the cultivation of ornamental plants. As early as 1813 it established a prize with the object of encouraging the development of nurseries for fruit trees. Another prize was instituted for the purpose of stimulating an interest in the plants believed to be indigenous to the department of Escaut. It gave many other prizes for the encouragement of gardening, and a number of special prizes for the encouragement of agriculture, but in the course of time the society became so impressed with the importance of local horticulture that it was felt necessary to limit its activity to this branch of its work.

In this brief sketch of the society and its work it is not possible to do more than give an outline of its accomplishment. At the commencement of the nineteenth century horticulture, practically speaking, did not exist in Belgium, and Ghent, in the matter of gardening, did not differ materially from other cities. Under the beneficial influence exercised by the society Belgium has become a country of market gardens, and Ghent a city that has no equal as a centre of commercial horticulture.

For much of the information here given we are indebted to an interesting contribution by M. A. Ceuterick, the general secretary of the society, to our enterprising Belgian contemporary "Le Tribune Horticole." In making this acknowledgment we would express the hope that, in accordance with our anticipations, the centenary celebration will prove an unqualified success.

G. G.

Asparagus plumosus.—There are many very pretty evergreen species of asparagus which are useful for greenhouse culture, but the above is the most popular, and has proved a most valuable plant for market purposes, the cut branches being extensively used in almost all floral work. It has to a great extent superseded the maidenhair fern, and is popularly known as the asparagus fern, though it is not in any way related to the fern family, being a flowering plant, and belonging to the natural order liliaceæ. These subjects are often treated as stove plants, but when grown in a high temperature, they may make satisfactory progress, but will soon lose their tiny leaves if exposed to the cold, but if started and grown on in a moderate temperature they stand exposure much better. All the species are very impatient of shade, and will not do under the shadow of other plants. They also require more root room than many other plants, and the roots, being of a fleshy nature, they require careful handling. In repotting, the thick, fleshy tubers of such sorts as Spren[illegible] and others of a similar nature, may [illegible] thinned out, all the old soil shaken away, and the roots washed quite clean, and if [illegible] before they get quite dry, they will take [illegible] of the new soil and start away at once. [illegible] a compost consisting chiefly of good [illegible] loam, with the addition of a little leaf-[illegible] manure, and sand, with good drainage.—B. Field, Ashwellthorpe Gardens.

SPRING WORK AMONG ROSES.

Roses have already begun to grow, but the basal eyes are still dormant. Pruning may commence at the end of March, starting with those varieties of the hybrid perpetual division that are in the most sheltered part of the garden. Another batch may be pruned ten days later. The first week in April will be early enough for the teas. In pruning hybrid perpetual roses, about 4in. of last year's shoots should be left near the base on young plants, while those established some years should be cut a trifle lower or the heads will become unwieldy, especially if standards. In the case of teas and noisettes, a prominent bud should be selected somewhere within 3in. or 4in. of the base of last year's growth, and by pruning back to such a bud we are assured of a strong shoot from this point. When tea roses are cut hard back the growth is more robust, and consequently the blossoms are finer. Moss Roses should not be pruned so closely; the vigorous shoots made last year should have their points removed, and be pegged down to within a few inches of the soil. In this way they cover the beds, and from each joint, consequent upon the check the sap receives by the depressing of the shoots, an abundance of blossoms is obtained.

The Penzance sweetbriars, which are most beautiful in their colour and freedom of blossoming, succeed best with but little pruning. Planted singly on grass and allowed to ramble away at will, removing any weakly growing shoots, they are most interesting. Trained loosely up poles at the front of a shrubbery they make a brave show, especially where backed up with evergreens, which act as a foil to the brilliant-coloured blossoms of such varieties as Meg Merrilies.

The beds and borders in which roses of any section are growing should be now lightly forked over, burying the manure employed in mulching as it will not be required as a protective material any longer, and dug in it will serve to nourish the plants and promote stronger growth and consequently finer blossoms.

Plants of the Gloire de Dijon class growing against walls produce the best blossoms from the wood of the previous summer's growth, should be neatly fastened to the wall. Lamarque, Aimee Vibert, and such of the old-fashioned roses as Jaune Desprez, that blossom in abundance from growth of the current year, should be pruned hard back to enable the growth to push strongly. Such roses need a good deal of attention in order to maintain them in a neat manner throughout the summer; therefore, an early start is imperative so as to lay the foundation growth in its proper place. In many instances it is not practicable to stimulate these old plants with short manure because of their position against the walls of the dwelling house, and the roots may be under the grass of the lawn. In this case heavy soakings of liquid manure in the spring will be decidedly beneficial.

S. H.

Calceolarias may be transplanted from their winter quarters into a sheltered border, where protection can be given; see that soil is well pulverised, and a good addition of sandy leaf-soil added; when plants are required for planting in their summer quarters, they will then lift with good balls of roots, and there will not be so many failures with them during summer.—E. F. Hazelton, Knowsley Gardens, Prescot.

BEETLE REVELATIONS.

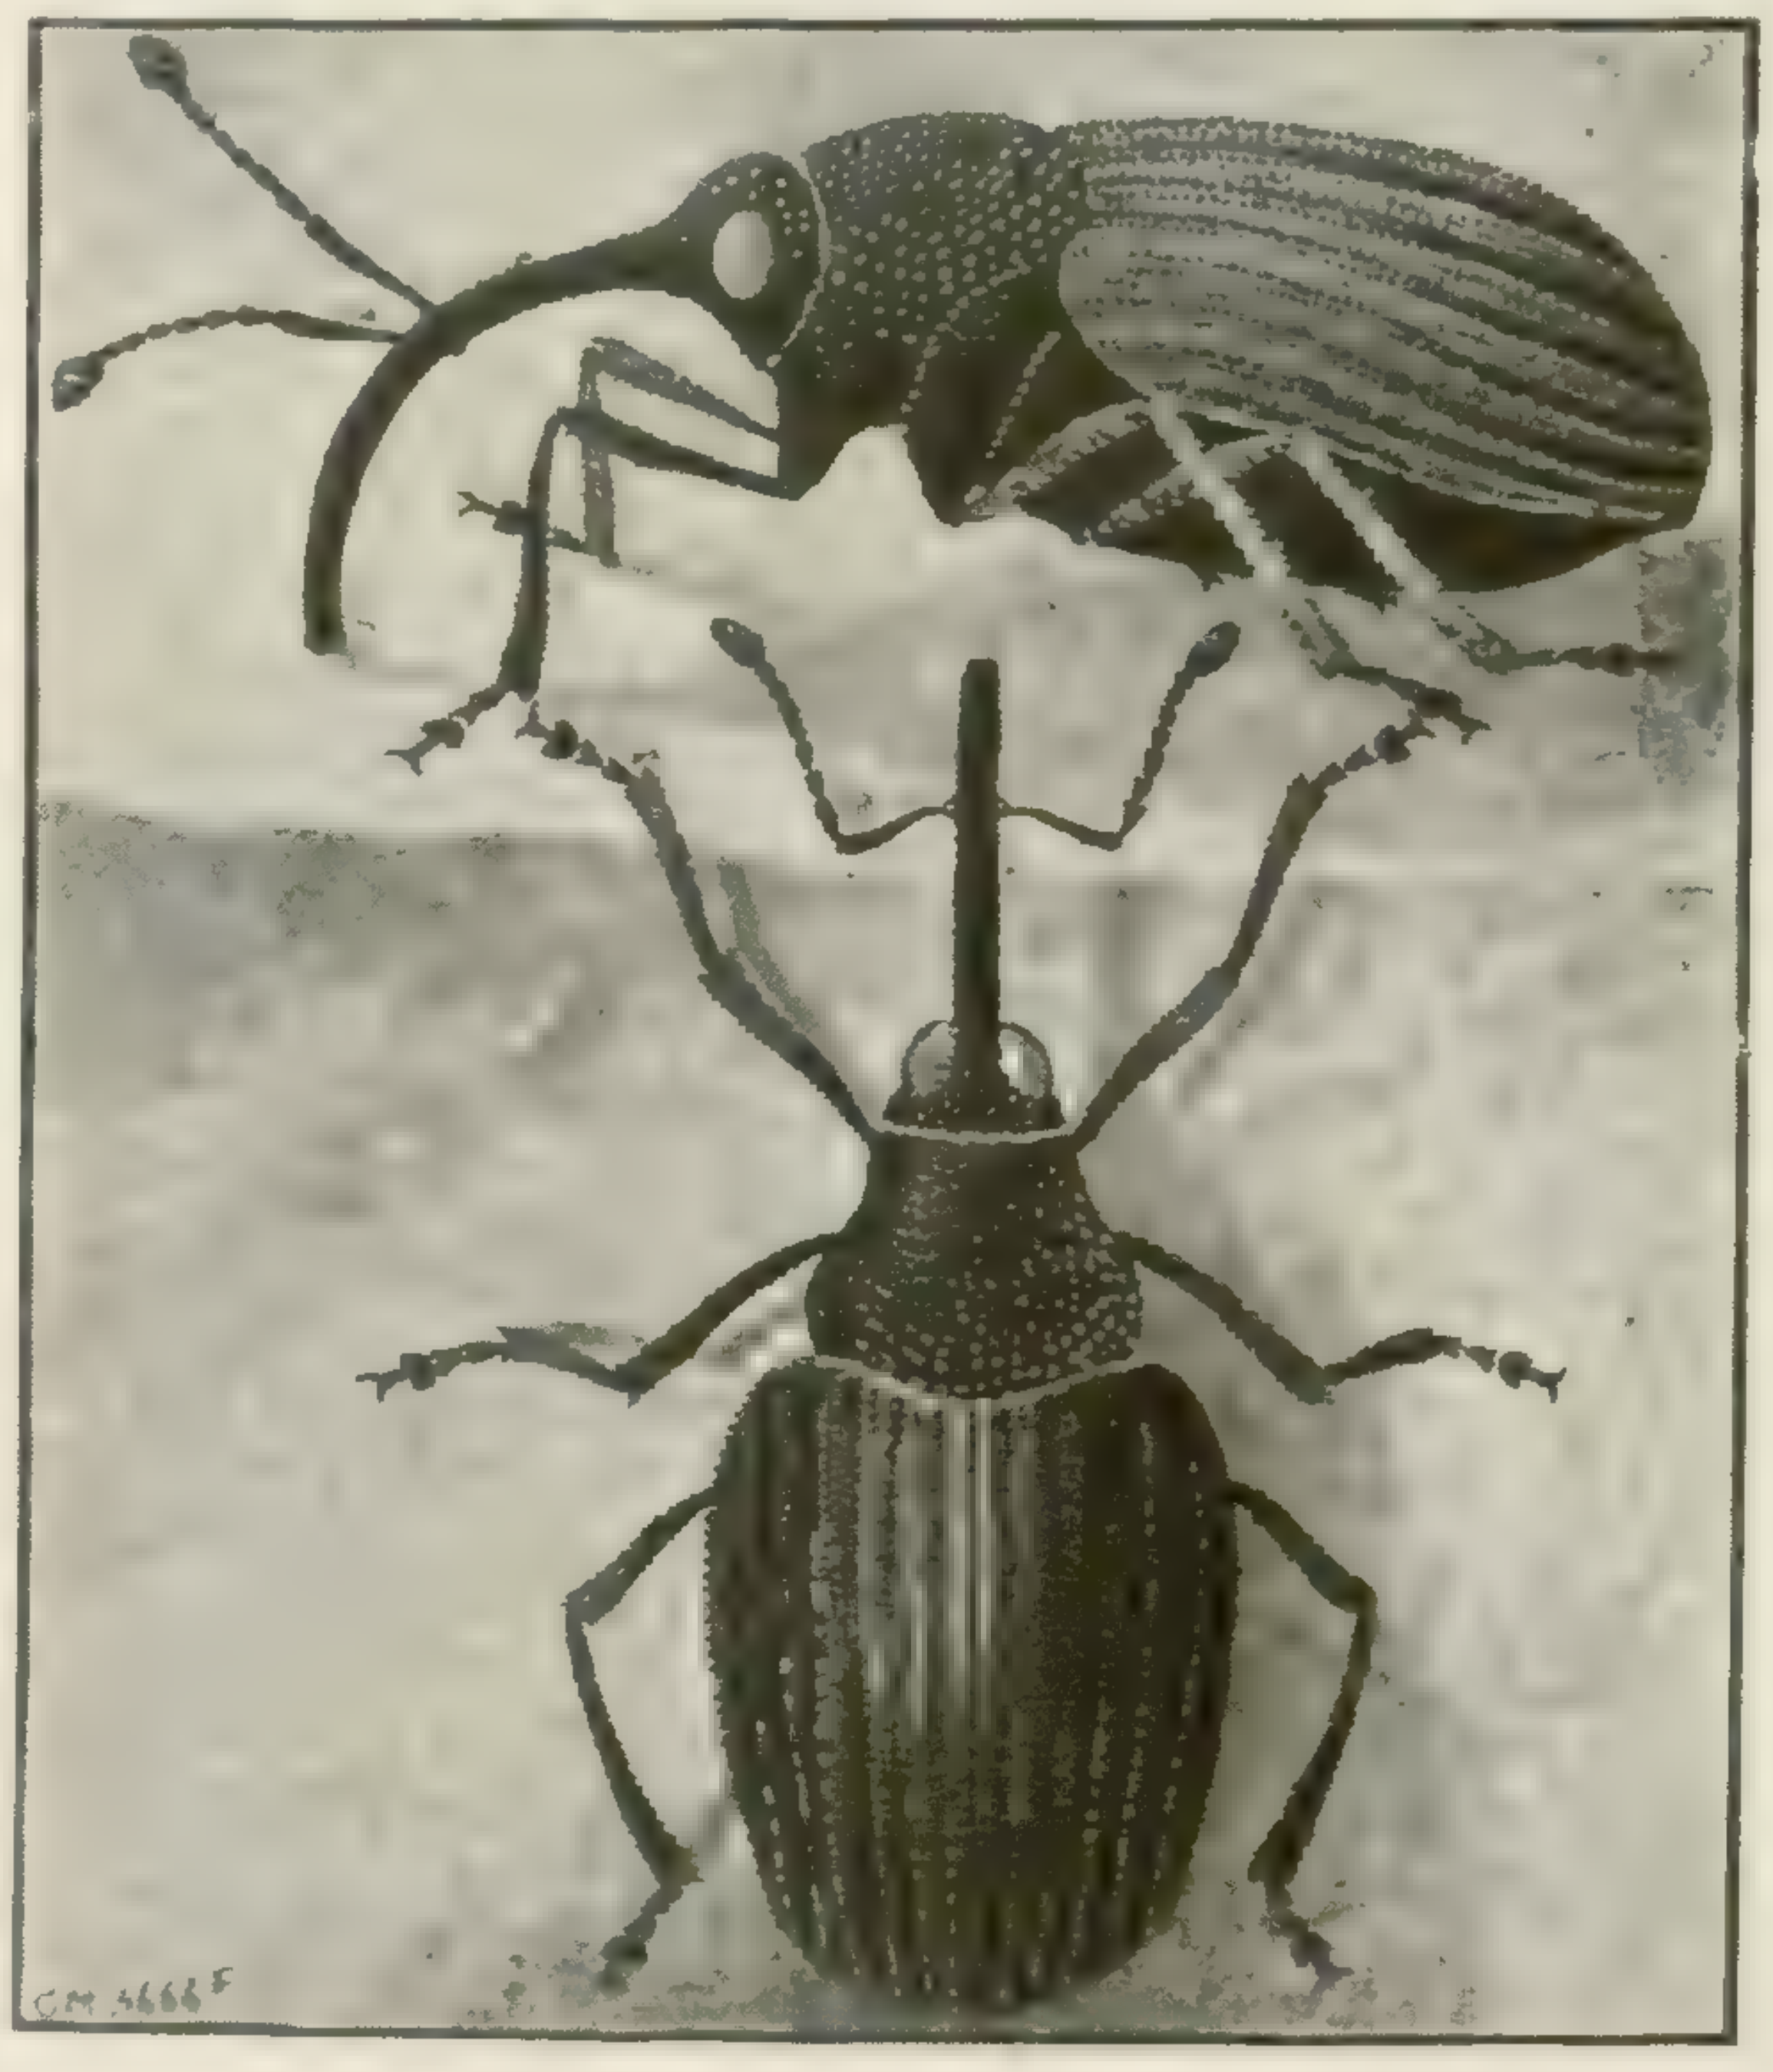
◆

Cabbage Gall Weevil.

Many gardeners must have often wondered what causes the gall swellings on roots of cabbages and turnips, the excrescences frequently being as large as hazel nuts, and very numerous. These deleterious consequences are directly due to the influence of the grubs of the gall weevil, a tiny creature of a dull black shade, from an eighth to a twelfth of an inch long, named Ceuthorynchus sulcicollis. The grubs are of similar length, yellowish-white, with brown heads, and footless. They habitually lay in their self-raised galls in a curled-up attitude.

The eggs are laid early during the summer on the roots of cabbages and turnips, and the grubs hatch therefrom within ten days, and immediately begin, through the irritation of the tissues due to their confined action, to cause the gradual enlargement of the parts. As may be understood, it is very difficult to dislodge them from this concealed position, so that one is faced with the annoying futility of direct insecticides. But inasmuch that their pupation or chrysalis state is undergone in the ground about the roots, the bisulphide of carbon remedy might sometimes come in serviceable.



CABBAGE GALL WEEVIL.
(Ceutorhynchus sulcicollis.)

Although the chief evidence of damage lies in the roots, prolonged attacks result in the complete decay of the plants. As they pass the winter in a kind of hibernation within their galls cabbages which look promising may suddenly exhibit ill-health owing to the grubs' renewed activities.

Charlock (wild mustard) and other cruciferous plants encourage their abundance, and these should be persistently destroyed if the pest has proved at all troublesome.

Plenty of gas lime in the soil will act as a deterrent. Destroy all cabbage stocks which have been affected.

James Scott.

(To be continued.)

Roses may be grown to perfection by following the instructions given in Roses and Their Cultivation, by T. W. Sanders. A selection is given, with description of all the best varieties, and full details for culture outdoor and under glass. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

SEEDLING ODONTOGLOSSUMS.—Fire heat during winter, and excessive hot weather in summer, appear to be the greatest drawbacks in the successful rearing of seedling odontoglossums. I might also add that lengthened periods of dull, sunless weather, when evaporation is slow, and the plants have the potting compost wet about them for long periods, also proves detrimental to seedlings in a small state. It is at such periods that algæ and weeds grow very rapidly, and spread over the surface of the potting compost, and choke the growth of seedlings even when they have reached leaf growth. The removal of these is one of the operations which take a long time to do, and there is little to show for one's work, but unless these weeds are removed there is very little prospect for the young plants. Carefully cut away with small scissors any growth likely to bury the young plants, and with a pointed stick remove any moss that may be on the surface of the compost. It is tedious work, but keeping the seedlings free is the only means of securing satisfactory results.

OLDER SEEDLINGS.—From the present time growth is very rapid in plants that are in a more advanced state. Every encouragement should be given to enable the plants to reach the first-bulb stage, for after the first pseudo-bulb is completed they are not nearly so difficult to deal with, and the rate of growth is practically doubled, for whereas it takes about two years to make the first pseudo-bulb, the next growth is completed in about one year, or less. It is remarkable the difference in the plants and the advancement they make when treated according to their requirements. I think it is quite possible to procure pseudo-bulbs and flower them from the first-made growths, but to acquire these desirable results no delays or checks must occur in the early stages, and the plants must be grown on as rapidly as possible.

POTTING.—Many seedling odontoglossums will be rooting at the present time, and when the roots are in an active state any repotting necessary should be attended to. Seedlings also in a small state will be found emitting roots, and may in this condition be removed from the seed beds and pricked out singly, or several together, in pots or pans. See that the pots are clean, and fill them to about half their depth with clean broken crocks or chopped dried bracken roots. We use as a potting compost about equal portions of chopped fibrous peat, sphagnum moss, and broken leaves, with sufficient sand and broken crocks intermixed to render the compost porous. The compost must be varied in the matter of coarseness to suit the sizes of pots used, and the strength of the plants. Water with rain water as soon as potting is completed, and keep ample moisture about the plants by frequently damping the floors, etc. Spraying overhead is desirable when the outside conditions are favourable. Shade carefully from strong light, and afford every encouragement that will assist the plants to root freely and develop growth.

SPRAYING.—We find it desirable to spray odontoglossums at regular intervals. Thrips are the greatest pests, and where houses are surrounded by, or situated near, herbaceous borders, thrips are plentiful during summer and autumn. Spraying with an approved insecticide fortnightly during the summer months keeps the pests in check, but careful observation is necessary where flower scapes are developing at the present season.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

COLEUSES.—There are few fine foliaged plants to surpass these in brightness and variety of colours, and one often wonders why they are not more popular; it is, perhaps, because they are often grown under unfavourable conditions. Too much heat and shade are usually given. As soon as the days begin to lengthen, and we get more sunshine, propagation should commence; if the first cuttings are not so strong as might be desired, they will soon gain strength after they are rooted, and the tops may be taken off, and these will often make good plants quicker than direct cuttings. Coleuses should be grown on without any stopping, and therefore it is of the first importance to have a good base. If plenty of room is given they will branch out naturally and make fine pyramidal plants. They will do well in almost any ordinary compost, providing it is not too heavy. Good drainage should be given, and, in potting, the soil should be pressed only moderately firm. During the early part of the season they do best in a fairly warm house, but should be kept up as closely to the glass as convenient, and have all the sunlight possible; later on they will do well without any artificial heat. Quite large specimens may be grown in eight-inch pots; and, by exposing them to all the sunlight possible, they not only make short-jointed, sturdy plants, but the colours are much brighter.

ISOLEPIS GRACILIS.—This ornamental grassy plant is quite indispensable for greenhouse decoration. It is very easily propagated by division of the old plants, the smallest tufts quickly becoming established if given moist quarters. Now is a good time to divide the plants, using pots about three inches in diameter, and giving a light, leafy, open compost, and good drainage. They are all the better if given intermediate quarters for a few weeks until thoroughly established, when a cool but shaded house suits them well. These plants look well arranged alternately with Panicum variegatum as an edging in a shady greenhouse.

IVY-LEAVED PELARGONIUMS.—The present is a good time to strike cuttings for autumn and winter blooming plants; they root freely now with the advancing light, and will keep sturdy, hard little plants that, if kept potted on as required, will not flower much until winter. Three or four cuttings rooted in a four-inch pot make nice little material for furnishing baskets. These should be lined with moss, and a suitable compost will be loam and leaf-mould, with a little good fertiliser and plenty of rough silver sand. This will be suitable for pot culture as well. Single plants flower well if finished in the eight-inch size, and these they will easily fill if well grown during the summer. Light pits are best for them, and the plants should be frequently pinched to induce a well furnished specimen, the flower buds being picked out as soon as they can be seen, until within a month of the time they are wanted to bloom.

PALMS.—These will now require attention, and, while in no way fastidious as to the date they are repotted, the present may be taken as a suitable season in which to undertake this work. A compost made up of the following will suit the class of palms usually found in greenhouses: Fibrous loam two parts, leaf-soil one part, and a half part of silver sand, and the remaining portion made up equally of ground charcoal and oyster shell. A little peat should also be incorporated, and the whole well mixed several times before using. Clean pots, liberal drainage, and firm potting are essential. A thorough cleansing of the foliage should follow. The syringe must be carefully used, especially in dealing with the more delicate types.

STREPTOCARPUSES.—These are most useful plants. The flowers are gloxinia-like in character, and produced in great profusion and in many shades of colour, and are well adapted for decorating. Young plants grow and flower the best, and especially so when raised from seeds, that should be sown now. They germinate freely in a light sandy compost, and in a moist, warm house. They are dwarf, and can be grown to a high state of perfection, with the assistance of stimulating manures, in very small pots. The only pest with which they are troubled is greenfly, and this can be easily kept in check by fumigation.—T. B. Field, Ashwellthorpe Gardens.

THE FLOWER GARDEN.

A LATE SPRING.—The cold, sunless weather we have had in Lancashire has made things very backward, so that many plants are flowering much later than usual, which, though disappointing now, will probably be to our ultimate advantage and pleasure. The watchful cultivator will act accordingly, though it may perhaps mean some little departure from previously arranged plans. The last of winter protecting material should now be removed, though if any quantity has been employed it will be best to remove it at intervals. The fritillarias, anemones, sisyrinchiums, leucojums, primroses, narcissi, violets, doronicums, etc., will be rapidly opening, giving more and more pleasure to the lover of flowers.

BULBS IN GRASS.—Where there are orchards, grass land, or pleasure grounds not already filled with bulbs, the old forced ones may be used for that purpose; if it is not convenient to keep them until fully ripened and dried off, they may be planted direct into the ground, and though probably a number will die, others will survive, gradually regain their strength, and establish themselves in a season or two, but I would not advocate using quite the very earliest forced ones for that purpose, while Roman hyacinths are quite useless for it.

FLOWERING SHRUBS.—Where there are suitable places on lawns or in the grounds for single specimen plants of the Moutan or tree pæonies now is a good time to transplant these from pots, if they have not made premature growth. Plant in good, rich, well-prepared soil. Protection from late frosts will be desirable. Before growth proceeds thoroughly examine all grafted plants and shrubs, such as standards of golden privet, rhododendrons, lilacs, Moutan pæonies, etc., and remove all suckers that may have been overlooked, or these will soon overpower the scion, eventually killing it. Magnolias will be expanding their blooms, and where trees are not too large protection should be given when frosts are imminent. Ribes, pyrus, and daphnes are not so tender.

PENTSTEMONS, antirrhinums, violas, etc., may now be planted in their flowering quarters; masses of each variety are preferable to indiscriminate mixing, as the effect is much more pleasing, and additional features can be made.

VIOLETS, as they pass out of bloom, should be lifted, and if the ground is to be again occupied with them give a good dressing of decayed leaf-soil, wood ashes, chalk or lime refuse; dig it in, and then divide plants to good single crowns, and replant at from nine to twelve inches apart, according to the vigour of growth; if the common sweet-scented violet is to be used six inches will be sufficient. Keep the plants well sprinkled or watered if the weather is at all dry, and should slugs be troublesome a dusting of soot or finely sifted wood ashes will be beneficial. All runners should be kept pinched off.

ANNUALS.—Continue to attend to pricking off annuals under glass, and a further sowing of these outside may be made for late blooming. Sub-tropical and other bedding plants must be kept growing, but avoid drawing them up in weakly condition. If circumstances compel their cultivation with other things, remove them from such unfavourable conditions on the very first opportunity, and gradually inure them to cooler and more open treatment. If zonal pelargoniums and other plants are getting too tall and leggy, pinch or stop them to induce a more bushy growth. Where bedding plants are in pits or frames remove the lights from them on all favourable opportunities.

MOWING.—If not already done, insure all mowing machines being in thorough repair, as mowing will now soon have to be commenced in earnest.—E. F. Hazelton, Knowsley Gardens, Prescot.

HARDY FRUITS.

GRAFTING.—Trees which may have been headed back to be regrafted with more suitable varieties should be carefully examined, and as soon as it is found that the bark will part freely from the wood grafting may be proceeded with. It is not much use attempting to regraft old worn-out trees, but those healthy and vigorous will, when regrafted, soon make fruitful heads, and go on fruiting for many years. If the trees are large crown grafting is the most suitable method to adopt, but in the case of small trees with stems half an inch or so in diameter, whip grafting is the more suitable. The branches of large trees should not be too severely shortened. I generally leave from one to two feet above the secondary branches so that more grafts may be placed on each tree to refurnish it more quickly. Those varieties which show fresh growth the earliest should be first taken in hand. The scions must be clean, firm, and well matured young wood about nine inches in length. Take a slice off the butt end about two inches long; make a slit the same length on the stock, and then raise the bark with a suitable flat-pointed stick, and then push in the graft. If the stock and scion are in good order there is not much doubt but the grafts will "take." Bind the grafts fairly firm, and encase the junction with a mixture of clay and cow manure thoroughly beaten into a moist paste. For whip grafting, instead of covering up the wounds with clay, use grafting wax, obtainable from seedsmen. Pears, plums, apples, cherries, etc., may all be grafted during the month of April; make a very careful selection of the most suitable varieties for the different purposes by way of keeping up a long supply of fruit.

LAST SEASON'S GRAFTS.—Examine carefully those trees which were grafted last year, and should the growths be strong they may be shortened back to within a reasonable length from the stems; see that they are securely fastened to prevent them being blown out when in full leaf. If a piece of stake be tied to the old branch and sufficiently long to fasten the grafts thereto, no harm will then be experienced.

STRAWBERRY BEDS.—Some of the varieties have suffered somewhat from the severe frost, and the leaves have a very scorched appearance, notably Waterloo and Royal Sovereign. But younger plants appear to be strong and less injured. Permanent beds, if not already done, should be mulched, and littered down; first examine the beds and remove any weeds, give them a liberal dressing with soot, spread on a good dressing of manure, and cover over with litter from the stables; the latter will be washed clean and sweet by the time the fruits are ripe, and will serve to keep them clean and free from grit. Young plants need to be made firm by giving them a good treading about their roots; they may then be lightly hoed, and then mulched; especially is this desirable on light dry shallow land. Plants intended for an early supply which were raised last July in small pots, and may have been planted on a snug border, need going over in the same way. These should be littered down, and when the flowers are about to open have ample material in readiness for a protection in case of a sharp frost. I have saved many crops by simply placing a handful of litter over the flowers when there has been signs of frost.

CUTTINGS of gooseberries, currants, etc., should not be overlooked now that the frost is out of the ground. They may have been loosened, and if neglected very bad results will follow. First push the cuttings in firmly and then give a good treading to firm them, then run the hoe lightly between the rows, and leave a crumbly surface to prevent cracking of the soil. If the weather should prove dry before rooting has taken place cuttings should be well watered whenever necessary.—H. Markham, Wrotham Park Gardens.

DEVON COUNTY AGRICULTURAL ASSOCIATION.
PLYMOUTH SHOW, May 19th, 20th, and 21st.
HORTICULTURAL SECTION.
[illegible] SYMONS, Esq., Chaddlewood, Steward.

Messrs. ADNITT and NAUNTON, Shrewsbury.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

MARCH 31.

With bright spring sunshine pouring through the glass roof of the hall, and illuminating the spring flowers within, those who visited the R.H.S. meeting of March 31 had a very pleasant time. Orchids were comparatively scarce, but forced shrubs, carnations, alpines, and hyacinths provided a full and bright display.

FLORAL COMMITTEE.

Winter-flowering carnations, in pots were well displayed by Messrs. Jas. Veitch and Sons, Chelsea, who also submitted batches of Eupatorium probum, Primula obconica, Primula Kewensis, and P. K. farinosa, Rhododendron Veitchianum, Boronia megastigma, and the useful B. m. aurea, Crowea angustifolia, Clianthus puniceus, and Streptosolon Jamesoni. In another group they had a handsome lot of blue hydrangeas, as well as Hydrangea Thos Hogg, Cerasus Jas. H. Veitch, lilacs, deutzias, Vitis flexuosa, V. [illegible], and the curious Grevillea sulphurea, the whole making up a fine group. The Misses Hopkins, Mere Gardens, Shepperton-on-Thames, had a very pretty little show of coloured primroses, double and single, muscari, primula species, and alpine shrubs.

Carnations were beautifully shown by Messrs. Bell and Sheldon, Guernsey; this firm had grand flowers of Enchantress, Robt. Craig, Nelson Fisher, Evangeline, Mrs. Lawson, and Britannia. Mr. C. Foster, University College Gardens, Reading, showed three [illegible] of Zvolanek's winter-flowering sweet peas, the flowers were of good size and prettily coloured. The fine Magnolia Campbelli and Aloe ciliaris were shown by [illegible] Countess of Ilchester, Abbotsbury, Dorchester. A large display was made by Messrs. Hugh Low and Co., Bush Hill Park, Enfield, and it consisted of a splendid lot of winter-flowering carnation flowers, these making a very notable feature, the Baby [illegible] rose, Mdme. Abel Chatenay rose, [illegible] Metrosideros floribunda, etc.

An interesting group of roses came from Messrs. Frank Cant and Co., Colchester; this firm had pot plants and cut flowers of Lady [illegible], Reine Carola de Saxe, Cecile Brunner, Mdme. Constant Soupert, Betty, Liberty, [illegible], and other delightful varieties.

A very large and striking exhibit of hyacinths in pots, arranged across the end of the hall, was staged by Messrs. R. and G. Cuthbert, Southgate, N. There were four long lines of plants, reminding one of the [illegible] of five and twenty years ago. There were about 160 varieties, and among the many Captain Boyton, Alba maxima, Cit-[illegible], City of Haarlem, Jacques, Cardinal [illegible], Electra, King of the Blues, Grand [illegible], [illegible] of the Reds, and Duke of [illegible], were conspicuous. A small group of [illegible] plants was staged by Mr. H. C. [illegible], [illegible]ham, Essex.

[illegible] hyacinths, a race that follows the [illegible] variety, were largely and well shown by Messrs. Sutton and Sons, Reading; these are very useful hyacinths for conservatory decoration or for cutting. The varieties were Giant Primrose, Giant Blue, and Giant White; the Reading firm also showed a very effective lot of cactus-flowered cinerarias in various shades of colour. Clematises in great variety, grown on small balloon trellises, and also trained fan-shaped, were shown well by Messrs. Richard Smith and Co., Worcester; Edouard Desfosse, Mrs. Cater, The Queen, Sir Garnet Wolseley, Standishi, Nellie Moser, and Albert Victor were varieties that attracted special attention.

Messrs. H. B. May and Son's exhibit consisted of choice ferns, the single perpetual rose Princess Ena, Clematis Nellie Moser, Pelargonium Clorinda, and cinerarias. Messrs. G. and A. Clarke, Dover, arranged a small rock garden, with hepaticas, primroses, polyanthuses, saxifragas, Iris reticulata, lachenalias, etc.

GM. 278

CLEMATIS SIR GARNET WOLSELEY.
A fine specimen, exhibited by Messrs. Smith and Co., at the R.H.S. meeting on Tuesday last. Flowers rich blue.

Messrs. John Peed and Son, West Norwood, sent up a display of perpetual carnations, showing all the popular varieties; they also contributed a group of alpines and a collection of caladiums, the latter proving very attractive.

Messrs. W. Cutbush and Son, Highgate, made up a bold and effective display of perpetual-flowering carnations, showing popular varieties in big vases. The same firm showed forced shrubs, and alpine and early herbaceous flowers in great variety; their primulas were a leading feature.

Mr. W. H. Page, Tangley Nursery, Hampton, put up another of his charming displays of carnations and liliums, arranging large vases of splendid blooms over a bed of maidenhair ferns. Mr. A. F. Dutton, Iver, Bucks, had a goodly lot of carnations, arranged in tall glass vases; Rose-pink Enchantress, Beacon, and Robert Craig were especially well represented. Mr. L. R. Russell, Richmond, set up a beautiful bank of forced flowering shrubs, the mollis azaleas, clematises, lilacs, forsythias, prunuses, wistarias, cytisuses, and laburnums being charmingly arranged with palms, ferns,and euryas,making up a delightful exhibit. Messrs. Heath and Son, Cheltenham, submitted an interesting collection of Cape pelargoniums that attracted a great deal of attention by reason of their fragrance. Messrs. Paul and Son, Cheshunt, submitted forced wistarias, cytisuses, Coronilla pygmæa glauca, Cytisus Firefly, Lonicera fuchsioides, and other interesting shrubs.

Mr. George Mount, Canterbury, brought up vases of lovely blooms of Joseph Lowe, Capt. Hayward, Frau Karl Druschki, Richmond, and Mrs. John Laing roses—a beautiful group. Messrs. H. Cannell and Sons, Swanley, made a big blaze of colour with their zonal pelargoniums, set up in large vases; the flowers and trusses were magnificent.

Early rhododendrons were grandly shown by Mr. R. Gill, Penryn, Cornwall, who had a big plant of the free-flowering R. ciliatum and handsome trusses of R. Shilsoni, R. arboreum varieties, R. barbatum, R. Blood Red, and other beautiful and gorgeous forms. Rhododendron Purity (A.M.), a lovely white rhododendron of beautiful form and pure whiteness, was shown by Mr. Charles Turner, Slough. The pretty purple-blue Viola gracilis (A.M.), and Shortia uniflora (A.M.), were shown by Messrs. R. Wallace and Co., Colchester. Several charming dwarf irises came from Mr. C. G. Van Tubergen, Jun., Haarlem, Holland, and one, I. sind-pers var. Amethyst, gained an A.M.

Glorious perpetual carnations were shown finely by Mr. H. Burnett, Guernsey, whose blooms of Enchantress, Rose pink Enchantress, Marmion, Mikado, Mrs. H. Burnett, White Perfection, Robt. Craig, and Beacon were perfect. Among Mr. Burnett's seedlings we saw a splendid big red variety with blooms five inches across. Messrs. R. Wallace and Co., Colchester, submitted a small collection of early Darwin tulips, associated with baskets of hepaticas, Anemone pulsatilla, Iris reticulata, crocuses, Shortia uniflora, fritillarias, and Dog's Tooth violets. Some good amaryllis were exhibited by Mr. F. Baker, gardener to Major Lister, Warningled Grange, Hayward's Heath, but many were rather past their best, and others had suffered during their journey to the show.

ORCHID COMMITTEE.

Mr. Alexander, orchid grower to Major Holford, Westonbirt, Gloucester, showed a magnificent specimen of Ada aurantiaca, carrying over fifty spikes of orange-scarlet flowers; and Cypripedium Helen II., Westonbirt var. (F.C.C.), Cattleya Suzanne Hye de Crom var. Jungfrau, a beautiful yellow-lipped cattleya (F.C.C.), was sent by M. Jules Hye de Crom, Ghent, who also showed Odontoglossum crispum Jules Coene, finely blotched. De Barri Crawshay, Esq., Rosefield, Sevenoaks, submitted Odontoglossum Astarte and O. Andalusia, the latter resulting from O. Andersonianum and O. loochristiense. Cattleya Schroderæ Queen Alexandra (F.C.C.), a magnificent flower, with a bluish zone round the yellowish throat, was shown by Messrs. Sander and Sons, St. Albans. A seedling O. crispum, heavily blotched, was shown by Messrs. Wm. Bull and Sons, King's Road, Chelsea; this was sown on March 3, 1905, and opened on March 30, 1908.

Odontoglossum percultum J. R. Roberts (A.M.), a beautiful orchid, with a spike of fourteen handsome rosy red-marked flowers, came from Mr. Davis, gardener to J. Gurney Fowler, Esq., Glebelands, South Woodford; from the same collection came O. Judith (sceptrum and loochristiense), and Cymbidium J. G. Fowler. Mr. H. J. Chapman, gardener to Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne, brought up Phaius Clive (F.C.C.), a superb hybrid from P. Norman and P. tuberculosus; and Phaio-calanthe delicata with white and rose flowers. Messrs. Heath and Son, Cheltenham, staged Epiphronitis Veitchi, Sophronitis grandiflora, and numerous cypripediums.

Mr. G. E. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, showed Cattleya intermedia nivea finely, an Odontoglossum hybrid from O. amabile and O. Rolfeæ—a grand flower, and several cypripediums. Cattleya Schroderæ was well shown by Mr. A. W. Jensen, Lindfield, Hayward's Heath, and in addition to several good varieties, there were numerous good forms of Odontoglossum crispum, including one with a rosy-purple ground colour and red-brown blotches.

Several pretty odontoglossums were exhibited by Mr. P. Forster Alcock, Northchurch. Mr. Balmforth, gardener to F. M. Ogilvie, Esq., The Shrubbery, Oxford, showed Odontoglossum Alexandrovitch, a purplish crispum variety. A cultural commendation was awarded to Mr. H. Tyrsoe, gardener to Miss Fitzpatrick, The Lodge, Bedford, for a fine example of Cyrtopodium punctatum, carrying five tall spikes of yellow and scarlet flowers.

DAFFODIL COMMITTEE.

The best exhibit of daffodils came from Messrs. Cartwright and Goodwin, Kidderminster, who staged pots of Golden Spur, Mervyn, White Lady, Alton Locke, Madame de Graaff, and Glitter, as well as cut flowers of these and other varieties. Mervyn, a shapely seedling from Emperor and obvallaris, and Evangeline, the latter a charming Leedsi variety with yellow cup, were both fine. Early tulips and some splendid vases of Chionodoxa gigantea, C. Lucilliæ, and C. sardensis, were shown by Messrs. R. H. Bath, Lim., Wisbech.

Daffodils were freely shown by Messrs. Barr and Sons, Covent Garden, and their display was edged with crocuses, anemones, and chionodoxas; this firm had also some early Darwin tulips, and vases of very pretty yellow, cream, and white freesias. With these were a few early hyacinths, anemones, hepaticas, and irises. Miss F. W. Currey, Lismore, Ireland, sent over a group of early daffodils, but the flowers were rather small; Sir Watkin, Victoria, Snowflake, Sirius, King Alfred, Artemis, Torch, and Golden Spur were the leading varieties. Mr. Charles Dawson, Gulval, Penzance, showed some charming daffodils that included some pretty flowers of Homespun, Calista, Althæa, Monica, Seamen, Leonard, and Nipper.

FRUIT COMMITTEE.

Royal Sovereign strawberries were splendidly shown by Mr. A. Grubbe, gardener to C. F. Raphael, Esq., Shenley, Herts, who staged a couple of dozen fruiting plants and six punnets of first-rate fruits. Oranges were famously staged by Messrs. Thos. Rivers and Son, Sawbridgeworth, Herts; there were splendid fruits of St. Michael's, Egg, Plata, Dom Louise, Navel (A.M.), Achilles, and Malta Oval oranges, and Paradise citrons and several varieties of lemons.

HYACINTH COMPETITION.

The hyacinth competition for prizes offered by the Royal Dutch Bulb Growers' Society of Haarlem, proved interesting, and though a goodly number of plants were shown, we believe that twenty-five or more years ago hyacinths were much finer than we saw them on this occasion.

For eighteen varieties equal first prize was awarded to Mr. E. Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, and Mr. R. T. Bushell, High Street, Wavertree, Liverpool; City of Haarlem, King of the Blues, Enchantress, Mary, Captain Boyton, General Vetter, Koh-i-noor, and Sarah Bernhardt were the leading varieties.

First prize for twelve hyacinths fell to Mr. James Vert, gardener to Lord Howard de Walden, Audley End, Saffron Walden; Mr. G. Mackinlay, gardener to the Hon. Whitelaw Reid, Wrest Park, Ampthill, Beds, second; there were four entries in this class, but the spikes were not especially good. For six plants Mr. W. H. Parr, gardener to F. A. Bevan, Esq., Trent Park, Barnet, led, and Mr. H. J. Bartleet, Severndroog, Shooter's Hill, was second. In the trade class for twenty-four plants Messrs. R. and G. Cuthbert, Southgate, were the only exhibitors, and they were awarded first prize.

CERTIFICATES AND AWARDS.

First-Class Certificate. — To Cattleya Suzanne Hye de Crom Jungfrau, from Mons. J Hye de Crom, Ghent; Brasso-Cattleya Digbyano-Schroderæ superba, from Messrs. Charlesworth and Co., Heaton, Bradford; Cypripedium Helen II., Westonbirt var., from Major Holford; and to Phaius Clive, from N. C. Cookson, Esq., Oakwood, Wylam-on-Tyne.

Award of Merit.—To Dendrobium Thwaitesiæ Bound's var, from Sir J. Colman, Bart., Gatton Park, Reigate; Cattleya Schroderæ Queen Alexandra, from Messrs. Sander and Sons, St. Albans; Odontoglossum percultum J. R. Roberts, from J. Gurney Fowler, Esq., South Woodford; Cypripedium Berkeleyanum, from J. Forster Alcock, Esq., Northchurch; Rhododendron Purity, from Mr. Chas. Turner, Slough; Viola gracilis and Shortia uniflora, from Messrs. R. Wallace and Co., Colchester; Iris sind-pers Amethyst, from Mr. C. G. Van Tubergen, jun., Haarlem, Holland; and to Navel Orange, from Messrs. T. Rivers and Sons, Sawbridgeworth, Herts.

MEDALS.

Silver-Gilt Flora.—Messrs. Jas. Veitch and Sons, Chelsea; Mr. L. R. Russell, Richmond; Mr. H. Burnett, Guernsey; Messrs. Richard Smith and Co., Worcester.

Silver-Gilt Banksian.—Messrs. Bell and Sheldon, Guernsey.

Silver Flora.—Mr. G. Mount, Canterbury; Messrs. W. Cutbush and Son, Highgate; Messrs. H. Low and Co., Enfield.

Silver Banksian.—Messrs. R. and G. Cuthbert, Southgate; Messrs. R. Felton and Sons, Hanover Square; Mr. W. H. Page, Tangley Nurseries, Hampton; Messrs. H. B. May and Sons, Edmonton; Messrs. Cartwright and Goodwin, Kidderminster.

Bronze Flora.—Messrs. F. Cant and Co., Colchester; Mr. A. F. Dutton, Iver, Bucks; Mr. R. Gill, Penryn, Falmouth; Messrs. J. Peed and Son, West Norwood, S.E.; Messrs. R. Wallace and Co., Colchester; Mr. G. Reuthe, Keston, Kent; Messrs. T. S. Ware, Lim., Feltham.

Bronze Banksian. — The Misses Hopkins, Mere, Shepperton-on-Thames.

Winter-flowering Carnation Show.

There was a very fair display of perpetual-flowering carnations at the Royal Horticultural Hall on April 1, but by no means a sufficiently large one for so big a hall, and had not a large number of exhibits been left over from the previous day, the visitors would have been very disappointed. The carnation flowers were on the whole very finely shown.

COMPETITIVE.

In the classes for thirty-six blooms of one variety, in the several colours, there was a moderate competition. For a white variety, Mr. W. H. Lancashire, Guernsey, led with White Perfection, showing some grand flowers; Mr. W. E. Wallace second with Lady Bountiful; and Mr. G. Lange, Hampton, third, with White Perfection. For a blush variety, Mr. W. H. Page scored with beautiful flowers of Enchantress; Mr. W. H. Lancashire second; and Mr. E. H. Sams, Worthing, third, with the same variety, all showing well.

The best light pink or salmon variety was Fiancée, shown by Mr. G. Englemann; it is a fringed variety, but only merited a second prize. Mrs. T. W. Lawson was well shown in the deep pink class, and to Mr. W. H. Lancashire was awarded first prize for a grand vase; Mr. W. H. Page second, and Messrs. Morres and Co. third, the latter showing very big but rather dull flowers. Mr. W. H. Lancashire came first for a crimson variety, with President, and Mr. C. Englemann second with Harlowarden. Mr. Lancashire scored for a scarlet variety with very bright flowers of Robt. Craig, and Mr. C. Englemann second with Victory, very fine. The only fancy variety shown, Jessica, was exhibited by Mr. C. Englemann; a third prize was awarded.

In the smaller classes, for eighteen blooms of a variety, Messrs. Bell and Sheldon led for a white with Lady Bountiful; Mr. W. E. Wallace, Eaton Bray, second, with White Perfection; and Messrs. Morres and Co. third with the latter variety; five competitors. The best blush variety was Enchantress, shown by Messrs. Bell and Sheldon; Messrs. B. and V. Haig, Maidenhead, second; and Mr. C. Englemann third with the same fine variety; five entries. In the light pink class Mr. A. F. Dutton, Iver, Bucks, led with Winsor, very fine; Messrs. Bell and Sheldon second, with Winsor; and Mr. C. Englemann third, with Mrs. H. Burnett. In the deep pink class, premier place was awarded to Mr. W. E. Wallace for Aristocrat, finely coloured; second to Messrs. Bell and Sheldon for Mrs. T. W. Lawson; and Mr. S. Mortimer third, for the latter variety. The President won first place in the crimson class for Messrs. Bell and Sheldon; Messrs. Morres and Co. second, with Harry Fenn; and Messrs. B. and V. Haig third, with Harlowarden.

There was a strong competition in the scarlet class, there being nine entries. Mr. A. F. Dutton, Iver, Bucks, scored with brilliant flowers of Beacon; Messrs. Morres and Co., second, with Robt. Craig; Mr. E. H. Sams, third, with Robt. Craig. For a vase of any variety not in commerce, Mr. W. H. Lancashire was awarded a first prize for Ivan[illegible], a variety much in the way of Mrs. T. W. Lawson. In the "any other colour" class Mr. C. Englemann was first with the [illegible] scarlet-flaked Imperial.

Mr. Burnett's special prize for the [illegible] vase of Mrs. H. Burnett was won by Mr. W. H. Lancashire; Mr. A. Smith's [illegible] prize for Britannia was won by Mr. W.

Wallace; Dr. Kyffen's special prize for the best vase in the large vase classes was won by Mr. W. H. Lancashire with his grand first-prize vase of Robert Craig.

AMATEURS.

Mr. A. T. Paskett, Groombridge, was the only exhibitor in the amateurs' class for a dozen carnation plants, and he was awarded first prize for a fairly good set.

In the same division there were two competitors in most of the cut flower classes, three flowers in each entry. Mr. J. Vert, gardener to Lady Howard de Walden, Audley End, Saffron Walden, scored for a white variety with Lady Bountiful; Mr. Paskett second with White Perfection. The same competitors occupied similar positions for a blush variety, with Enchantress; and for a deep pink variety with Winsor and Mrs. T. W. Lawson respectively. Mr. Paskett was placed second with Salmon Lawson, and Mr. Vert third with Welcome, in the light pink class. Mr. Vert scored for a crimson with Crimson Glow, and Mr. Paskett came second with Harlowarden. Mr. Vert was awarded a first prize for Robt. Craig, scarlet, and also for a mixed vase; Mr. Paskett coming second. Mr. Vert, in every case, showed flowers with long stems, and Mr. Paskett short ones.

DECORATIVE EXHIBITS.

For a vase of carnations arranged for effect, Mr. W. H. Lancashire, Guernsey, led with about a dozen fine flowers of Mrs. H. Burnett; Messrs. B. and V. Haig second with mixed varieties. Mr. A. F. Paskett, Groombridge, was winner of the first prize for a basket of carnations, scoring with a charming arrangement of pink and red flowers. Mr. Hayward, Kingston-on-Thames, led for a bouquet of Enchantress, and he was also to the front for three sprays and three buttonholes, Messrs. B. and V. Haig following in each case.

NON-COMPETITIVE.

Messrs. Jas. Veitch and Sons, Chelsea; Messrs. J. Peed and Son, West Norwood; Messrs. W. Cutbush and Son, Highgate; Messrs. Heath and Son, Cheltenham; Messrs. Richard Smith and Co., Worcester; Messrs. Thos. S. Ware, Lim., Feltham; Mr. G. Reuthe, Keston, Kent; Mr. W. H. Page, Tangley Nurseries, Hampton; Mr. A. F. Dutton, Iver, Bucks; Messrs. H. B. May and Sons, Edmonton; Messrs. G. and A. Clarke, Dover; Messrs. Hugh Low and Co., Enfield; and Messrs. Bell and Sheldon, Castel Nurseries, Guernsey, all left their exhibits over from the R.H.S. exhibition, and these are described in our report thereof.

Messrs. Morres and Co., Castel, Guernsey, submitted a lot of handsome blooms of good carnations; their best vases were of Mrs. Thos. Lawson, Beacon, White Perfection, Britannia, and Enchantress. Mr. C. Englemann, Saffron Walden, set up delightful flowers of Lady Bountiful, Prosperity, Enchantress, Red Ridinghood, The Cardinal, Mikado, Victory, and Rose Pink Enchantress, in large vases.

Mr. C. F. Walters, Deanland Nurseries, Balcombe, Sussex, staged a group of handsome carnations, showing large vases of pink Malmaisons, Enchantress, Britannia, White Perfection, Beacon, Mrs. T. W. Lawson, Harlowarden, and Rose Pink Enchantress. Mr. G. Lange, Hampton, had some famous vases of Fair Maid, Winsor, Mrs. T. W. Lawson, Aristocrat, Mrs. Patten, Enchantress, Britannia, and other good varieties.

NEW VARIETIES.

A first-class certificate was granted for the big fancy variety named Marmion, which we figured some time since; and an Award of Merit to Mikado, deep heliotrope. Both these were from Mr. H. Burnett, Guernsey.

MEDALS.

Gold.—Mr. W. H. Page, Hampton; Mr. C. F. Walters, Balcombe; Messrs. Hugh Low and Co., Enfield; and Mr. H. Burnett, Guernsey.

Silver-gilt.—Messrs. Bell and Sheldon, Guernsey; Messrs. Morres and Co., Guernsey; Mr. A. F. Dutton, Iver, Bucks.

Silver.—Mr. G. Lange, Hampton; Mr. C. Englemann, Saffron Walden.

Birmingham Gardeners' Association.

The fifth fortnightly meeting of the spring session was held on March 23, when Mr. Alfred Cryer, gardener to J. A. Kenrick, Esq., Berrow Court, Edgbaston, was responsible for an interesting and instructive chat upon "Bulbs for House Decoration and Exhibition." Mr. Walter Jones presided over a very good attendance of the members.

Mr. Cryer, who is a well-known and successful gardener, prefaced his subject with remarks on the climatal exigencies pertaining to those in close proximity of a manufacturing town, as compared with those favoured with a clear atmosphere. His own practical experience had been for upwards of the last twenty years, under the less favourable conditions, consequently he could not bo expected to successfully compete with those placed under more auspicious circumstances. In dealing with early spring-flowering forced bulbous plants, the lecturer naturally commenced with narcissi, and in the case of the plants for table decoration, he advocated the planting of a dozen or more bulbs in bowls or pans, each containing one variety only, and when in a state of inflorescence, they could readily be introduced to the ornamental bowls or vases, and at once present an imposing effect. So also a similar procedure could follow with tulips, lilies of the valley, and other suitable subjects. The cultural and decorative properties of lilies, and numerous other bulbous plants, were more or less commented on, both for border and for forcing. It may also here be noted that Mr. Cryer adverted to the highly decorative value of the hippeastrums, of which he is a notable expert and specialist, having raised numerous high-class seedlings.

The subject-matter was interestingly discussed by several of the members, and a hearty vote of thanks was accorded Mr. Cryer.

Bristol Gardeners' Mutual Association.

A well-attended meeting was held on March 26 at St. John's Parish Rooms, presided over by W. E. Budgett, Esq. In opening the proceedings the Chairman referred in feeling terms to the death of Mr. Orchard, late gardener to Arthur Baker, Esq., Henbury Hill, and proposed that the secretary write a letter of condolence to Mrs. Orchard. Mr. J. C. House seconded the motion, which had the support of all members.

The subject for the evening was "Weeds," by Messrs. Garnish and Jennings. Mr. Garnish opened the subject, and said he experienced a difficulty in what to say and what to leave unsaid owing to the wide scope of the subject. He explained that there were tall, dwarf, creeping and climbing, perennial, and annual weeds. In the herbaceous border there were, the speaker said, some plants that were no better than weeds when neglected. He concluded by saying that weeds were a blessing as their eradication caused labour.

Mr. Jennings dealt with weeds in their various aspects, such as unsightly weeds in paths, but recommended weed killers. He found an old wall a very prolific place for dandelions, etc., but advised spraying the wall, as by so doing it would save trouble, as seed blew a long way when ripe. The speaker found it hard work in keeping a lawn free from weeds, but advised, when possible, to lift the turf and hand weed it. Mr. Budgett opened the discussion, and was followed by Messrs. Clark, Lee, Curtis, Binfield, Shaddick, and House.

For a lady's spray and a gentleman's buttonhole, for under-gardeners only, Mr. Grieve was first, Mr. Coombes second, Mr. Attwell third, and Mr. Austey was awarded an extra. Certificates were awarded to Mr. Holt for four pots of mignonette; Mr. Curtis for Dendrobium fimbriatum oculatum; and Mr. Shaddick for Dendrobium nobile.

NEW BOOKS.

THE BOOK OF GARDEN PESTS.

By R. Hooper Pearson, F.R.H.S. (John Lane, The Bodley Head, London.) Price 2s. 6d. net.

The publication of this important addition to Mr. Lane's list of handbooks of practical gardening is a matter of considerable interest, inasmuch as it affords a strong proof of the fact that cultivators are becoming keenly alive to the desirability of their possessing a knowledge of the best methods of dealing with the various plant pests. With this increased interest in the matter which has an important bearing upon the degree of success attained there is good cause for satisfaction. It is satisfactory because, with a knowledge of the best methods of preventing attacks, and dealing with infestations at his finger ends, the cultivator has his daily task materially lightened as compared with the time when but little was generally known of the more destructive of fungoid diseases and insect pests.

There are, of course, many good books on plant diseases and injurious insects, but there is not, as far as we are aware, one that is on the same lines as that now before us. In the majority of cases fungi and insects are dealt with in separate books, and to this there is no objection except that of cost, which, to a very considerable proportion of those engaged in practical horticulture, is a very serious matter. In the "Book of Garden Pests" both fungi and insects are dealt with, and as the several kinds are arranged under the respective host plants, the reader is able to find, with the smallest amount of trouble, any enemies with which his plants may have been attacked, and full information relating to the best methods of combating them. If, for instance, his ferns have become unhealthy, and he turns to the section devoted to them, he will, with the aid of the information given therein, learn whether they are being injured by weevils, scale, aphis, root-feeding mealy bug, or fern rust. Having ascertained the cause of the injury that is being done, it will be found a very simple matter to discover the best remedy and the method of application. In addition to the sections into which ornamental plants, fruits, and vegetables are grouped, there are chapters on pests common to many species of plants, common to fruit trees, and common to vegetables, and on insecticides and fungicides. The book is so admirably arranged, freely illustrated, and concise, clear and sound in treatment, that it can be recommended as one of the most valuable contributions that has of late been made to horticultural literature, and we heartily congratulate Mr. Hooper Pearson on the splendid success he has achieved.

FLOWERS AND FRUITS FOR THE HOME.

By I. L. Richmond. (T. N. Foulis, 13 and 15, Frederick Street, Edinburgh.

A brightly written book, admirably adapted to the requirements of the amateur horticulturist, in which Mrs. Richmond deals with such subjects as bulbous plants, carnations, basket plants, hardy climbers, flowering trees and shrubs, chrysanthemums, tuberous begonias, and small and wall fruits, in an instructive manner.

PERMANENT AND TEMPORARY PASTURES.

By Martin J. Sutton, F.L.S. (Simpkin, Marshall, Kent, and Co., Lim., London.) Popular edition, price 1s.

In issuing a popular edition of his great work on the formation and management of pastures at the price of one shilling, Mr. Martin J. Sutton has rendered a service of immense value to those of limited means who are interested in grass lands. Twenty-two years have elapsed since the first edition was published, and during this period it has been our duty to speak of the successive editions in appreciative terms, and the edition that is now before us fully confirms the high opinion we have had of the work. This edition, although published at so low a price, leaves nothing whatever to be desired in the matter of paper and printing, and has been carefully revised.

ROSE GROWING MADE EASY.

By John G. Lockley. ("Amateur Gardener" Proprietary, 14, Moore Street, Sydney.) Price 1s. 6d.

A well-written and freely illustrated book on the cultivation of roses, that should prove of much value to amateur rosarians in New South Wales. The dates of introduction of the varieties included in the best hundred roses require careful revision.

VILLA GARDENS.

By W. S. Rogers. (Greening and Co., Lim., London.) Price 6d.

A book that should be useful to amateurs with small gardens who desire to render them as beautiful and interesting as possible. The author has provided a large number of excellent plans for laying out small areas of garden ground, and gives much useful advice on the points requiring attention.

THE CASE FOR THE GOAT.

By "Home Counties." (George Routledge and Sons, Lim., London.) Price 3s. 6d.

The author, who has a high opinion of the value of the milk supply derived from the goat, has set himself the task of endeavouring to remove the ignorant prejudice against the animal, but whether he succeeds or not, he will have the satisfaction of knowing that he has presented the case for the goat in an admirable manner. There is, of course, much to be said both for and against the keeping of goats for the purpose of contributing to the milk supply of the household. The milk is unquestionably rich and nourishing, and therefore most valuable as an article of diet for young children, and especially for those who have a weakly constitution. Not only is the quality high, but the supply is quite sufficient to give an ample return for the cost of food and the time involved in the management of the animals. In the case of goats, as of other domesticated animals, good management is essential to ensure successful results, and, as a matter of course, well-bred animals can alone be depended upon to prove satisfactory. Those who are at all interested in goats will do well to obtain a copy of the work and make themselves masters of the contents. If they do this they will not only be fully acquainted with the author's views on the more important points relating to keeping goats for profit, but they will know what the views of other goat keepers are on such questions as breed, milk production, food supplies, and management. The book is freely illustrated.

FORTHCOMING ENGAGEMENTS.

The Editor is always glad to receive intimation of exhibitions, and copies of schedules.

TUESDAY, April 7.—Brighton Spring Show; two days.
Croydon Gardeners' Association; lecture on "Peaches and Nectarines," by Mr. Seabrooke.
National Amateur Gardeners' Association; lecture on "Beautiful Arrangements of Roses," by Mr. G. Gordon, V.M.H.
Truro Daffodil and Spring Flower Show; two days.

WEDNESDAY, April 8.—Examination in Horticulture at the Royal Horticultural Hall.

THURSDAY, April 9.—Glamorgan Spring Show.

TUESDAY, April 14.—Royal Horticultural Society; Fruit, Floral, and Orchid Committees meet at 12 o'clock; Narcissus Committee at 11.30 a.m.; lecture at 3 p.m. on "Hardy Cacti and Other Hardy Succulents," by Mr. E. A. Bowles, M.A., F.L.S.; Scientific Committee at 4 o'clock.

WEDNESDAY, April 15.—Royal Society of Arts.
Royal Caledonian Horticultural Society's Spring Show; two days.
Tunbridge Wells Daffodil Show.

THURSDAY, April 16.—Brighton Horticultural Society Meeting; lecture on "Botany for Gardeners," by Mr. E. F. Hawes.

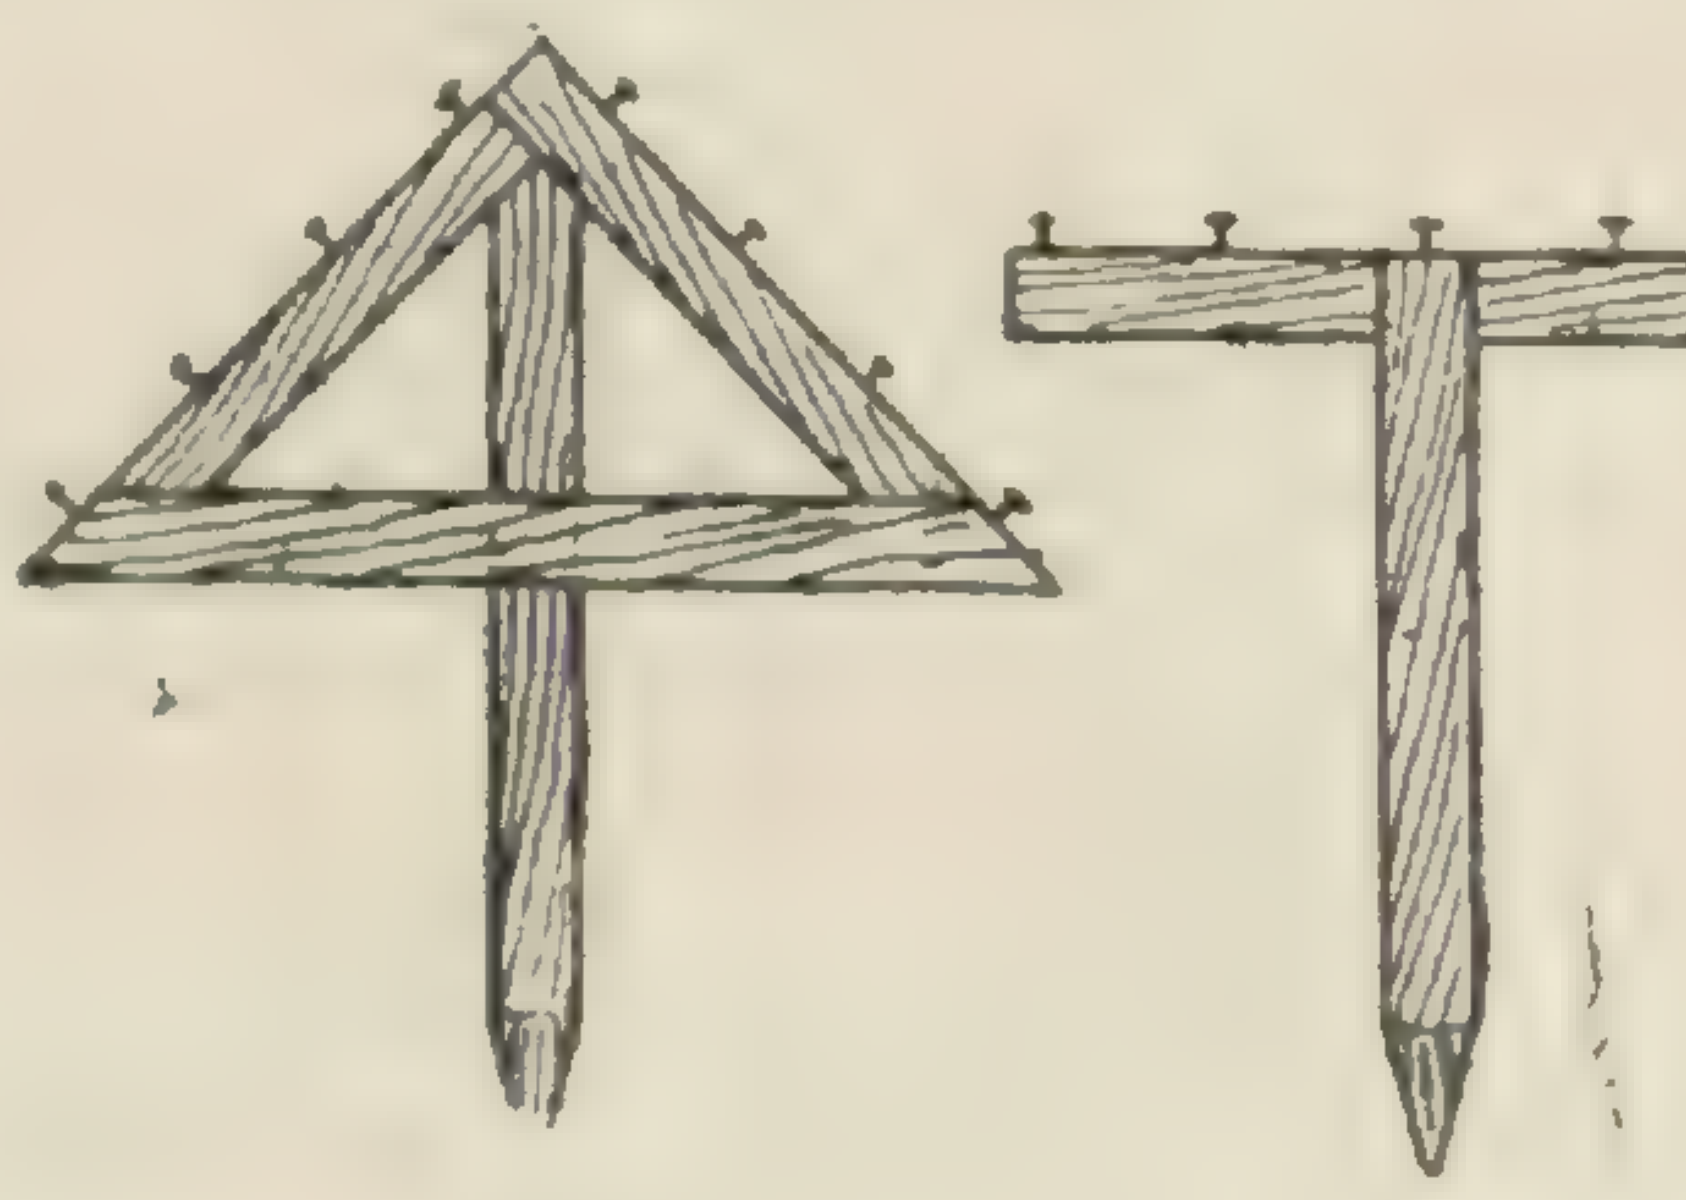
MONDAY, April 20.—Easter Monday.

ANSWERS TO CORRESPONDENTS.

EVERGREEN BEECH.—N. O. R., Andover: The evergreen beech is Fagus betuloides, a native of Terra del Fuego. It has bluntly ovate leaves that are tough, and of a rich shining green colour. It is perfectly hardy, and, during winter, when so many trees are bare, it is particularly handsome. So far as we are aware, the Evergreen Beech is not difficult to cultivate.

MADONNA LILIES.—T. N. W., Lydney: The best, and, indeed, the only proper time to transplant the white Madonna lily is directly after it has finished flowering. It is almost leafless at that season, but it soon begins to make a small tuft of new leaves, and these keep green throughout the winter. Do not disturb the plants now, and unless the clump is a very large and dense one, or there are other good reasons for removal, do not disturb the bulbs after they have flowered, but give them a good top-dressing of dried cow manure and leaf-mould.

PROTECTING SEEDLINGS WITH THREAD OR COTTON.—A. A. L., Winchester: Where birds are troublesome in the spring, and there are few gardens in which they do not levy toll on the seeds and the juicy seedlings when protective measures are not resorted to, for protecting seeds and seedlings in beds, it is a good practice to fix sticks about six inches apart on each side of the beds, and then stretch black thread across them in all directions a few inches above the surface. Rows of peas and other seeds can also be protected by stretching black thread along them, but the following plan is preferable. Obtain some laths about one inch by three-quarters of an inch, and make stretchers of triangular or T-shape, as shown in the accompanying illustrations. Fix nails along the top, as shown, and place the stretchers six or seven feet apart, and then stretch thread along the rows, giving the strand a twist round a nail to make it secure.



THREAD STRETCHERS.

SEEDLING CARNATIONS.—T. S., Devon: The crimson variety has very intense colouring, indeed, we are afraid the colour is almost too deep to be really effective; the calyx bursts, and this is a defect. The cream-coloured seedling impresses us with its fine calyx and soft colouring; if the petals were a little smoother it would be very fine. We should like to see blooms again, as both varieties are of considerable promise.

HYBRID SAXIFRAGAS.—F. E. B., St. Neots: There are several very useful and beautiful saxifragas of hybrid origin, and among the most popular for garden use are: S. Andrewsi—S. Geum x S. Aizoon; S. apiculata—S. aretioides x S. scardica; S. Boydi—S. aretioides x S. Burseriana; S. Macnabiana—S. Cotyledon x S. lingulata or S. Hosti: and S. Salomoni—S. Rocheliana x S. Burseriana.

BASAL GROWTHS IN CHOICE LILACS.—M. F. S., Norwich: The growths springing up from the base are suckers produced by the stock, and should be removed. Carefully remove the soil around the suckers so as to trace them back to their source, and then cut them back as closely as possible. Such suckers rob the choice variety, and, if allowed free course, will eventually overpower it completely.

LIME TREES ON LIGHT SOIL.—C. G., Southampton: About the worst possible tree for planting in light thin soils is the lime tree, because it suffers quickly from drought, and is one of the first of trees to be defoliated in a dry summer. In deep soil, and a moderately moist district lime trees are very beautiful and graceful; in fact, few trees are more beautiful, but as town trees, and on light soils they are not a success.

BEZI MAI PEAR.—D. J., Hereford: This variety appears to be but little grown nowadays, as there are so many better pears. It is a very late variety, coming into use in May, but it rarely has a sufficiently long and hot summer to do it justice in this country. It was raised in Brussels by M. J. de Jonghe, and first fruited in 1856. The late Mr. Blackmore, who tested so many pears at Teddington, described it as "fit for a nether millstone."

EARLY-FLOWERING CHRYSANTHEMUMS. — M. E., Southport: Lift the old stools and pull them to pieces, discarding the hard central portion. Every piece that has roots attached will make a plant if carefully treated. It is a good plan to set out the pieces six inches apart in a nursery bed of rich soil, as here the plants will receive a little extra attention in the way of watering, etc., and they will soon make sturdy plants that may be transferred to the positions they are to flower in as opportunities occur.

DISEASED GERANIUMS.—H. S., Tooting: In many cases the plants are suffering from a fungus attack in the stems, but we are not certain whether this is the cause of the damage or whether it follows after a severe check caused by over-watering. We have seen plants suffer in similar fashion when watered with ice-cold water. All you can do is to take off the tops and insert them as cuttings in a warm pit. Heavy fogs following after the plants have been well watered prove very injurious to soft-wooded plants grown in the London district.

BASKET PLANTS FOR A STOVE.—S. S., Aylesbury: There are many subjects suitable for filling baskets to hang in a large stove, and among these the ferns figure largely. Asplenium longissimum, Davallia fijiensis, several of the nephrolepises, D. polyantha, D. tenuifolia Veitchi, Gymnogramma schizophylla gloriosa, Adiantum caudatum, A. dolabriforme, and A. cuneatum grandiceps are a few good ferns for the purpose. Several young plants of Cissus discolor placed in a basket and trained round the wires and up the chains produce a fine effect. Acalypha hispida, Æschynanthus splendidus, A. tricolor, A. Lobbianus, A. Boschianus, Fittonia argyroneura, Russellia juncea, Selaginella Galeotti, and Utricularia montana are other subjects that may well be pressed into service.

BEES IN PEACH HOUSES.—N. E. S., Canterbury: It is a capital plan where there are several peach and orchard houses to follow each in the order of flowering, to place a hive of bees in each house successively; the bees will attend to the fertilisation of the flowers during their search for honey. Mr. Hudson uses a hive of bees in his orchard houses at Gunnersbury.

PALAFOXIA HOOKERIANA.—C. H. R., Harwich: The Palafoxias form a small genus of the order Compositæ, and they are natives of Northern and Central America. They are half-hardy annuals, at least, those in cultivation are best so treated, though the several species are seldom seen in gardens. P. Hookeriana makes a bushy plant about a foot or more high, and it carries its rosy-carmine flower heads in clusters. Seeds should be sown at once in gentle heat, and the seedlings pricked out into boxes of light soil as soon as they are large enough to handle. They must be hardened off in due course, and planted in light soil in a warm position.

A MOSS-LIKE PLANT.—P. S. H., Bristol: We are in some doubt as to the plant you refer to, but, failing selaginellas of the S. Kraussiana type, which you dispose of, we can only conclude that the moss-like plant you have seen is Helxine Solieroli. This is a tiny plant, not at all unlike a mossy selaginella at first sight, but it is in no sense related to the selaginellas and ferns. It belongs to the great Nettle family, and is hardy in the southern counties. In a cool house it might well be used as an edging plant in the same way that Selaginella Kraussiana is used in a warmer house. It creeps and roots with the utmost freedom, and is propagated by pulling a little tuft to pieces and inserting the smaller tufts in sandy soil; large sixty-sized pots, well filled with Helxine Solieroli, with the moss-like greenery hanging over the rim, are very pretty objects, and the green is so deep and rich that it is very suitable for association with flowering plants of all kinds. Some few years ago Mr. P. Waterer exhibited a large group of phloxes at the Royal Horticultural Hall, and margined the display with Helxine Solieroli, in pots, and it was noticeable how few people knew the plant, but how all admired it. Helxine Solieroli comes from Corsica and Sardinia, and is obtainable through the nurserymen who advertise in our columns.

NAMES OF PLANTS.

L. C., Carlisle.—1, Primula verticillata; 2, P. marginata.

T. M., Wolverhampton: 1, Aphelexis humilis; 2, Nepenthes Mastersiana; 3, Ada aurantiaca.

G. N. G., Gloucester.—1, Saxifraga oppositifolia; 2, Adonis amurensis; 3, Chionodoxa Luciliæ; 4, Erica carnea.

A. T., Chester.—1, Sequoia gigantea; 2, Acacia cultriformis; 3, Polygala Dalmaisiana; 4, Odontoglossum cirrhosum.

J. W. Ripon.—1, Anemone hepatica; 2, Adonis amurensis; 3, Pinus Laricio; 4, apparently Cupressus funebris; poor specimen.

C. R., Exmouth.—1, Pittosporum Tobira; 2, Hibbertia dentata; 3, Acacia Drummondi; 4, Camellia reticulata; 5, Rhododendron arboreum; 6, Acacia armata.

D. P., Grosmont.—1, Cupressus Lawsonianus Silver Queen; 2, Abies concolor; 3, A. grandis (Gordoniana); 4, Pinus Cembra; 5, Abies Nordmanniana; 6, Cupressus Lawsonianus gracilis aurea.

Flowering of Calanthe Veitchi.—With reference to the inquiry relating to the flowering of this beautiful calanthe made by Mr. Pragnell, the average number of flowers on a spike produced by the plants grown here is 40. Of this number we have about thirty expanded flowers at one time, all quite fresh. At times a few produce 45 blooms. As a rule only one spike is allowed to each pseudo-bulb, and when there are two spikes the number of flowers is about 30.—J. MAYNE, Bicton, Devon.

LETCHWORTH GARDEN DESIGN EXHIBITION AND COMPETITION, 1908.

The Garden City authorities at Letchworth have instituted the following interesting competitions:—

Class 1.—Design for gardens of a suburban residence, drawings of which will form part of the particulars furnished to each competitor. These drawings will include a site plan giving levels. Class 2.—Design for gardens for above, to include a rose garden. Class 3. —Design for gardens for above, to include a Kelway herbaceous border. Prizes: Class 1, first prize, £5; class 2, first prize, £3 3s., given by Mr. Robert Harkness, rose grower, Hitchin, Herts; Class 3, first prize, £5; second prize, £3 10s., both given by Messrs. Kelway and Sons, Langport, Somerset.

Class 4.—Design for gardens for a block of ten cottages, to be built as a speculation on a corner site, six facing east and four facing north. Drawings, including site plan with levels shown thereon, form part of the particulars supplied to competitors.

Entrance fee for each of the above classes, 2s. 6d. For full particulars, intending competitors should write to the Estate Office, First Garden City, Lim., Letchworth, Herts, inscribing letters, "Garden Design Competition."

The drawing, embodying part of the particulars given to each competitor, has been kindly prepared for the purpose by Messrs. Barry Parker, and Raymond Unwin, architects, Letchworth. All designs sent in for competition, which are to reach the Estate Office, First Garden City, Lim., Letchworth, not later than June 1, 1908, must bear a nom de plume only, and must be accompanied by a sealed envelope giving the competitor's name and address. Designs sent in for class 3 are to become the property of Messrs. Kelway and Sons.

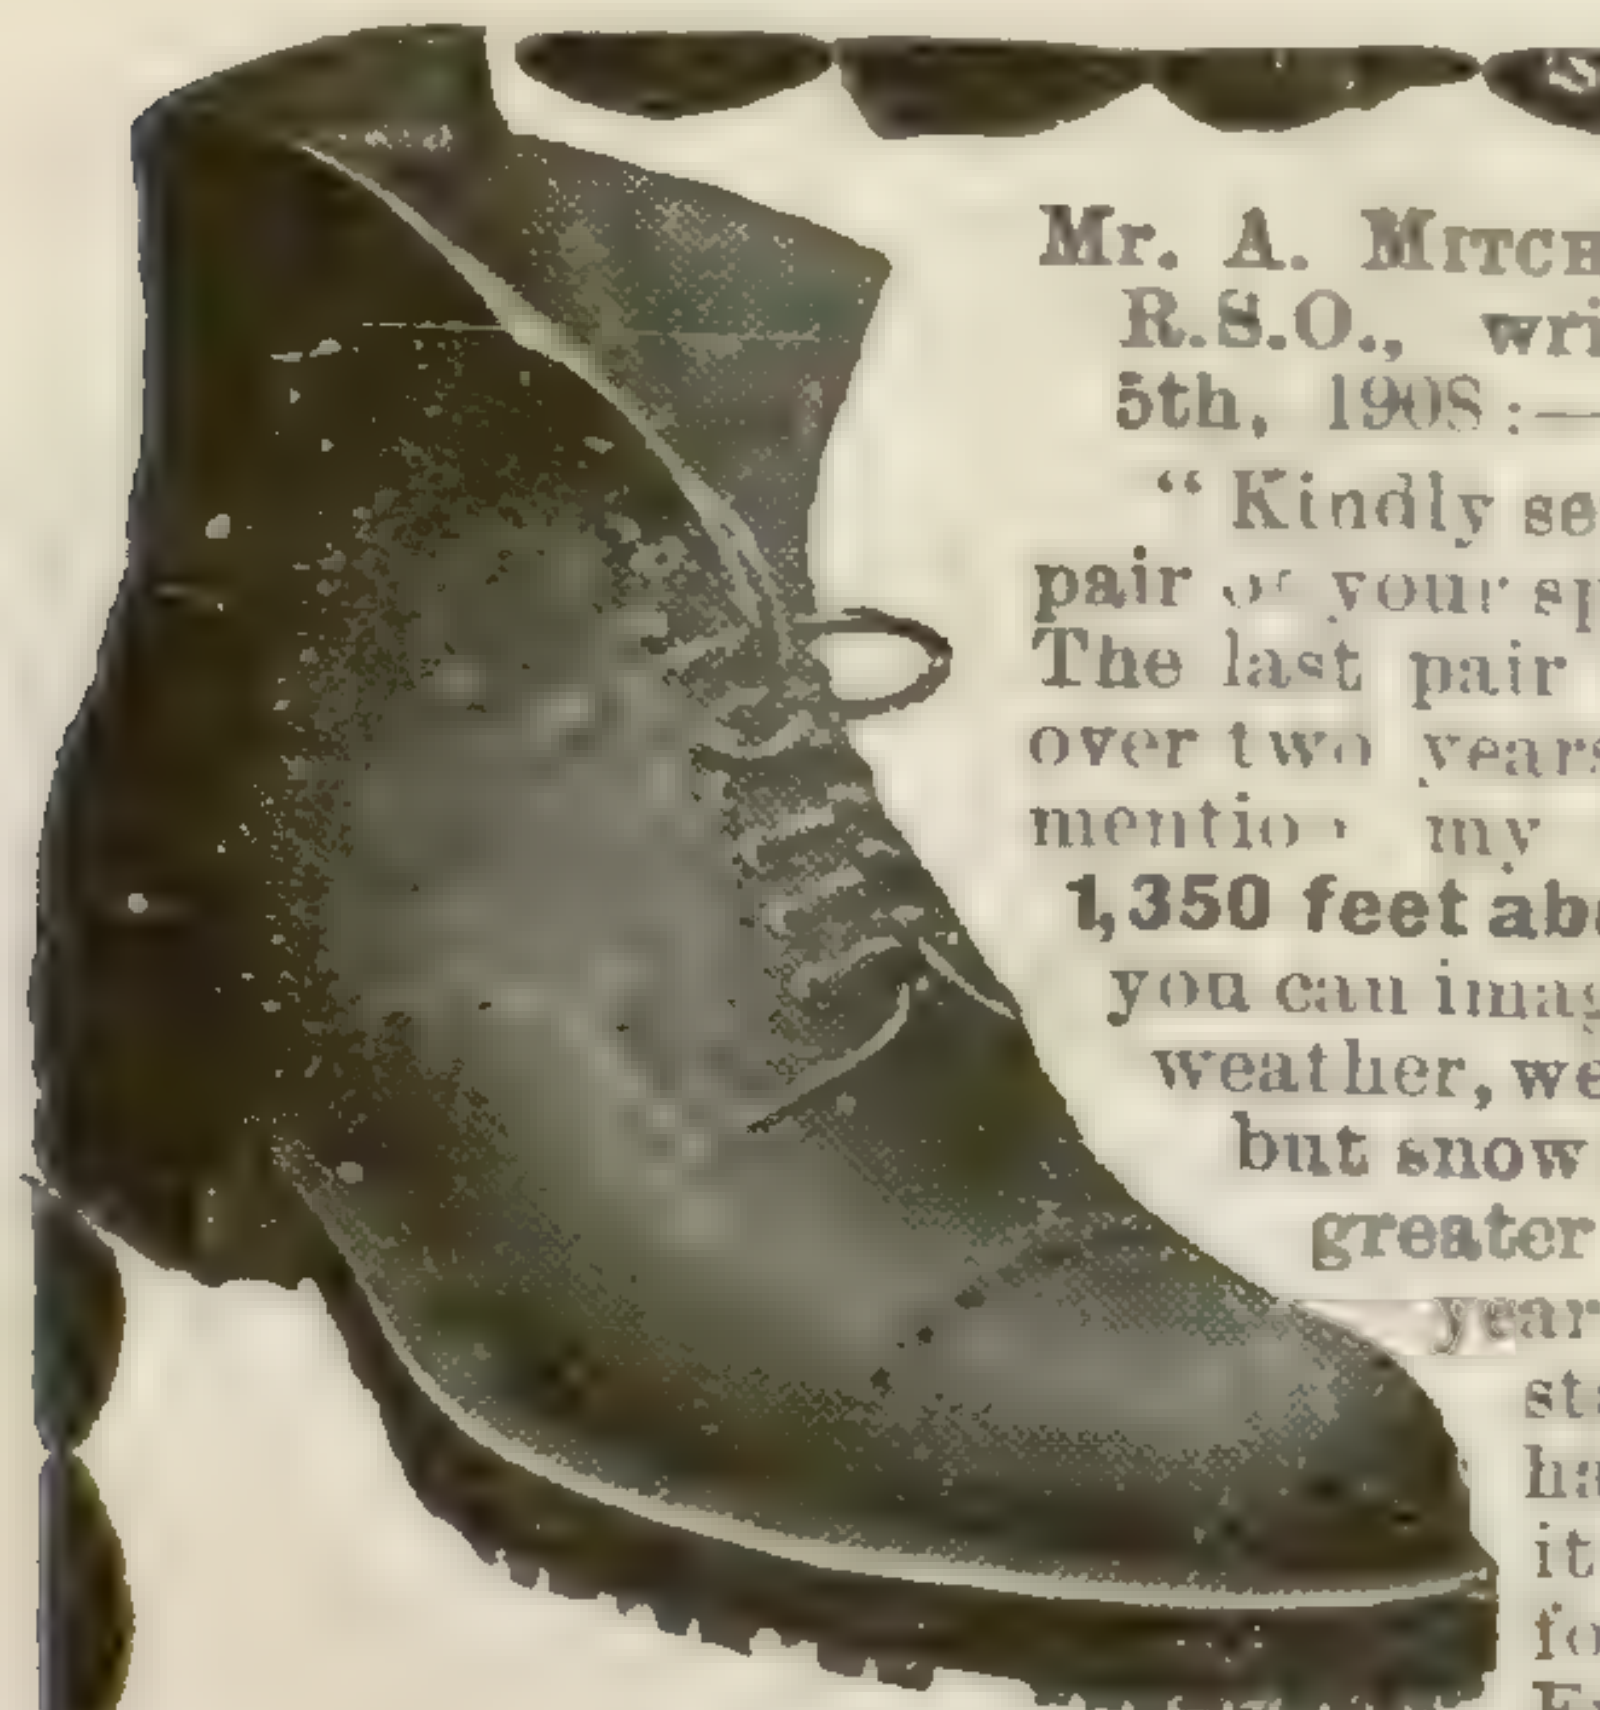
Please send me a copy of "Carnations, Picotees, and Pinks" by post, for which I enclose remittance of 2/10.

Name ....

Address ....



Mr. A. MITCHELL, Corrour R.S.O., writes us Mar. 5th, 1908:—

"Kindly send on another pair of your splendid Boots. The last pair has worn me over two years, and when I mention my house stands **1,350 feet above Sea level,** you can imagine the awful weather, we have nothing but snow and slush the greater part of the year. When I state I never had a wet foot it speaks well for your Boots. Enclosed P.O. 16/-.

NORWELL'S PERTH BOOTS

Stand the wear and tear of Gardeners.

Write for our Illustrated Price List.
Your wife and family have our special attention also.

Gardener's Boots 10/6, 12/6, 13/6, 15/6.

YOU TRY—

NORWELL'S PERTH To-day.

A valuable Manure for all Grass Lands, composed of ingredients calculated to encourage A VIGOROUS GROWTH OF GRASS ONLY. Per cwt., **20/-**; ½-cwt., **12/6**; 28 lb., **7/6**; 14 lb., **4/6**; 7 lb., **2/6**. Sample tins, **1/-**.

For Hints on Making and the Management of Lawns, see **Barr's Lawn Grass Circular**, Free on Application.

BARR and SONS,
11, 12 & 13, KING ST., COVENT GARDEN, LONDON.

NEW SEEDLING MONTBRETIAS.

Prometheus, King Edmund, Lady Hamilton, Lord Nelson. All have been certificated by the R.H.S. and provincial societies.

A writer in the Press, speaking of the Novelties of the past year, describes them as "*The finest introductions of the year.* Also see page 164 in issue of Feb. 29.

Full particulars and prices on application.

WALLACE'S LILIES

have been awarded in recent years **Seven Gold Medals** by the Royal Horticultural Society.

Unsurpassed for Quality and Condition.

Our Spring Catalogue contains a full Descriptive List of these, of which we have a splendid variety in stock; also

GLADIOLI, BEGONIAS, TIGRIDIAS,
Cypripediums (hardy), etc.;
HARDY PLANTS—Alpine & Herbaceous
in all sections.

All specially dealt with.

R. WALLACE & CO.,
Kilnfield Gardens, Colchester.

-Chester.

WARE'S BEGONIAS.

Awarded 40 Gold Medals and Silver Cups.

The finest strain procurable, strong well-ripened Tubers.

SINGLE, mixed, **2/6** doz.; **18/-** 100; in separate colours, **4/-** doz.; **25/-** 100. Extra quality, **8/-** and **10/-** doz.

NEW SINGLE FRILLED-EDGED, mixed, **6/-** doz.; in distinct colours, **9/-** doz.

SINGLE CRESTED, mixed, **6/-** doz.; in separate colours, **9/-** doz.

DOUBLE, mixed, **3/6** doz.; **25/-** 100. In separate colours, **5/-** doz.; **35/-** 100. Extra choice, **12/-**, **15/-**, and **25/-** doz.

SPECIAL BEDDERS, Phosphorascens, Count Zepplin, Worthiana, and others from **3/6** doz.; **25/-** 100.

Superb Collection of Named Varieties.

BEGONIA SEED, Double choicest mixed, **2/6** and **5/-** pkt. Single choicest mixed, **1/-** and **2/6** pkt.

New Catalogue Free by Post.

Address "Dept. No. 2,"

WARE'S NURSERIES, FELTHAM.

ROSES. ROSES.

Special Offer of Surplus Stock at nominal prices, for our selection of sorts only. Dwarf H.P.'s, **3**/- doz.; Dwarf Teas, **4/6** doz.; Climbers, **5**/- doz. Packing and carriage **1/-** doz. extra. Purchaser's selection at very reduced prices. Catalogues free.

THE DEVON ROSERY AND FRUIT FARM, Ltd.,
Devon Rosery, TORQUAY.

ORCHIDS.

LARGE AND HEALTHY STOCK. CHOICE VARIETIES.

20,000 sq. feet of glass devoted to Orchids only.

Moderate Prices. Inspection Cordially Invited.

IMPORTER AND GROWER:

FL. CLAES, 63-65, Rue des Champs, Etterbeek
BRUSSELS.

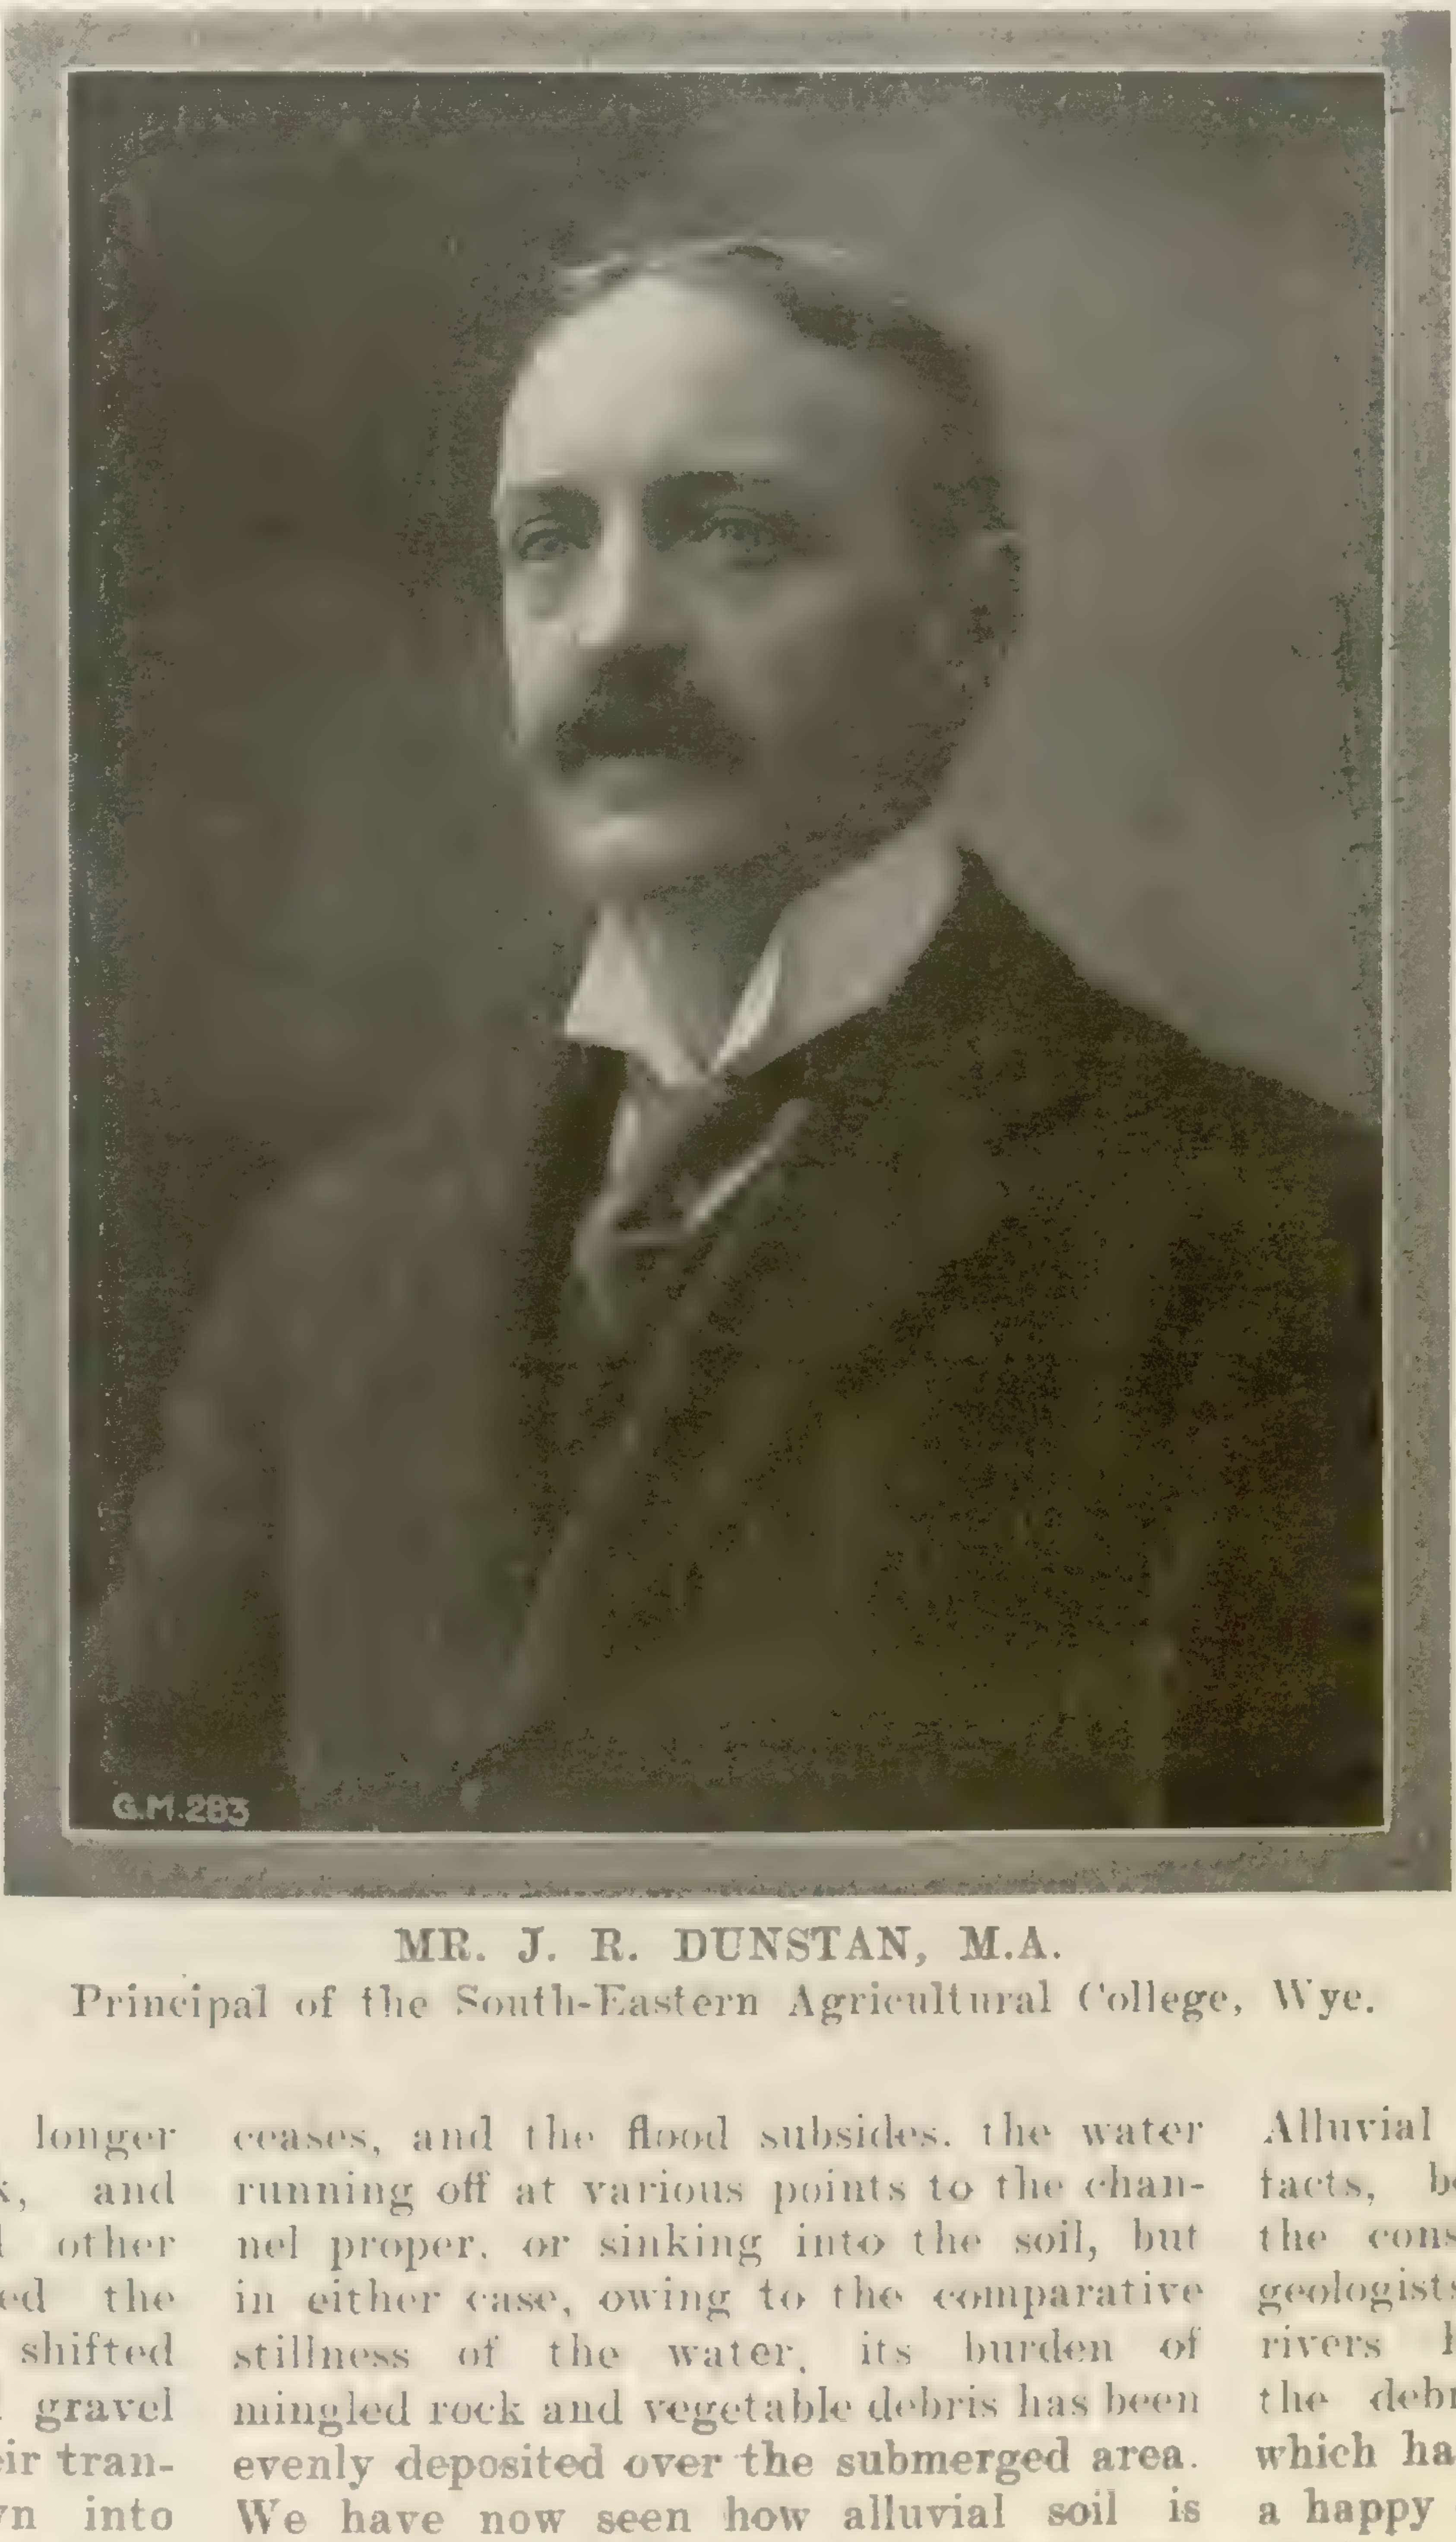
NOTES OF THE WEEK.

Alluvium.

Since alluvial soils are undoubtedly the most fertile and valuable to both the horticulturist and the agriculturist, a little consideration of what they consist of, and how they are formed, may not be out of place, especially as they are so generally distributed even over areas now far from water that their origin is apt to be overlooked. Although they may differ to some extent in their composition, they all agree in being a mixture of the debris of rock formations and vegetable matter, and this, as a rule, forms a compost of such richness that virgin alluvial may bear many successive heavy crops before it shows any signs of exhaustion. To arrive at an idea of how this compost is formed, we must make our way to the higher levels, where the rivers begin to become such by the meeting of innumerable tributary streams, which are fed by the rain or snowfall of the hill or mountain districts concerned. In fine weather we may find these streamlets running down their glens or traversing their channels in the open as clear as crystal, and we look in vain for the evidence we seek, unless we be in glacier land, of which more anon. Revisit them, however, in stormy, rainy weather, and the scene is changed. A rushing, roaring, boiling flood is now rushing downward through every channel, and this is no longer clear, but turbid and thick, and laden with debris of trees and other vegetation. In the stream bed the very rocks themselves may be shifted and, in any case, the stones and gravel are being carried along, and in their transit are wearing themselves down into smaller gravel and finer sand, and by their attrition taking a modicum off the stubborner rocks in their course. The dead leaves, branches, and other debris carried down are ground up with the rocky material, and the mixture goes down with the laden flood to swell the nearest river on its way to the distant ocean. Let us now descend a bit to lower levels, traversed by sinuous brooks, rivulets, and rivers, which we may now find meandering through perfectly flat plains of greater or less extent. The rainfall has been great, too great indeed for the ordinary channels of these streams to carry immediately away, and the level plain is flooded. The rain ceases, and the flood subsides, the water running off at various points to the channel proper, or sinking into the soil, but in either case, owing to the comparative stillness of the water, its burden of mingled rock and vegetable debris has been evenly deposited over the submerged area. We have now seen how alluvial soil is formed in the first case, and how its fertility is brought about, and we can also gather that the level plain in question is simply and solely the result of successive inundations and deposits of similar character. In time the river bed is cut deeper and deeper, and also alters its course, as it cuts away its banks, now on one side and now on the other, and hence we may eventually find deep alluvial deposits far away from the streams which formed them, to say nothing of those upward movements of the land itself, which may determine their existence on a vast scale far from any existent river at all. We may, however, find great accumulations of alluvial soil under somewhat different circumstances, as, for instance, near the mouths of great rivers, which, despite the deposits they may have made in their upper reaches in the way above described, yet reach the ocean with a considerable burden of alluvial debris. Meeting the ocean water their flow is checked, and this inevitably means a settlement. In this way deltas are formed, and in the case of the Nile this delta is of enormous area, and by its accumulation has, as is often the case, led to the river splitting up into several branches, which wind their way through the accumulated land, and are constantly adding to it. In many large lakes there is a constant silting up at the mouths of the rivers which empty themselves into them, as, for instance, at the head of Lake Geneva, where the rapid Rhine, fed by the melting snows of the Alps, constantly brings down enormous quantities of alluvial soil, which deposits itself so entirely when it reaches the still water of the lake, that the river at the lower end issues as clear as crystal, and as purely blue as the unsullied Atlantic itself. Alluvial soil may, in view of these facts, be considered as that part of the constant waste of the land which geologists term denudation, which the rivers have left behind them, plus the debris of vegetation of all kinds which has become mixed with it en route, a happy combination indeed for mankind, as plant cultivators of all kinds need hardly be told.



MR. J. R. DUNSTAN, M.A.
Principal of the South-Eastern Agricultural College, Wye.

Mr. J. R. Dunstan, M.A.—Although the South-Eastern Agricultural College, as suggested by its name, has for its chief object the teaching of the science and practice of agriculture, more than sufficient attention is devoted to horticulture to justify the work of the college being of much interest to those who are concerned with that important art. We have proof of this in the fact that seven members of the staff devote themselves to horticulture, and other aspects of education that have a direct bearing thereon, and there are well-equipped fruit and vegetable gardens with an area of about eighteen acres, with a range of glass sufficient to afford students an opportunity of becoming acquainted with the production of the various crops that can be grown under glass. With a knowledge of the fact that the teaching of agriculture and horticulture is happily combined in the curriculum, we have watched the growth of the college with much interest since it was opened at the end of 1894. More especially have we been interested in the rapid increase in its extension and popularity during the period—now some six years—that Mr. Dunstan, whose portrait we have the pleasure of giving, has occupied the position he now holds. When Mr. Dunstan was appointed principal of Wye College in 1902 there were 55 students, and now there are 125, an increase so large as to testify in no uncertain manner to his administrative abilities. The success he has achieved has not, perhaps, been greater than those who were acquainted with his work might have expected, for he came to the college with a record of which any man might well have been proud. Educated at St. Paul's School and Merton College, Oxford, and subsequently doing good work as a University Extension Lecturer, Mr. Dunstan was appointed Director of Agricultural Education for Notts County Council in 1891, and subsequently received other appointments connected with agricultural and technical education in the county. In 1900 he was appointed director of the Midland Agricultural and Dairy Institute for the counties of Notts, Derby, Leicester, and the Lindsey Division of Lincolnshire, and this position he occupied until he came to Wye. Mr. Dunstan was a few years since awarded the silver medal of the Royal Society of Arts for his paper on the milk supply.

Royal Botanic Society's Subscriptions.—At a recent meeting of the Fellows of this society the council submitted a proposal for so amending the bye-laws as to enable them to alter the rate of subscription. It was explained by Mr. J. R. Diggle, that until the close of last year the club in the society's gardens was under the control, not of the council, but of a Club Committee. To become members an additional subscription had to be paid, and to this arrangement many Fellows had a strong objection. The council, after careful consideration, decided that the club as a separate institution should cease, and they proposed an alteration in the bye-laws by which the annual subscription would be raised from two to three guineas; and that all the Fellows would enjoy the advantages of the club. Life Fellows, who had compounded by the payment of £25, would pay an annual subscription of £1 1s., or a sum of £5 5s. There was a lengthy discussion on the proposed alteration, and at the close of the ballot Mr. Pembroke S. Stephens, K.C., who presided, announced that 61 had voted for the alteration and 23 against, and, therefore, as a three-fourths majority was required the motion had not been carried.

Metropolitan Public Gardens.—At the monthly meeting of the Metropolitan Public Gardens Association it was reported that the Housing and Town Planning Bill was under consideration, and, while the latter portion of the Bill was generally approved, it was pointed out that certain amendments were required in the first part for the proper protection of public open spaces and recreation grounds, and it was decided to take steps in order to secure such amendments. Various contributions from friends and supporters of the association were announced towards Ludshott Common scheme, for which about £550 is still needed, the proposed addition of 12 acres to Ruskin Park, for which a balance of about £5,000 is needed from voluntary sources, and the Barking Road and Bow Recreation Grounds, for which £800 and £200 are respectively required to complete the purchase funds. Progress was reported regarding the acquisition of 30 acres at Norwood, for which £2,000 is outstanding.

Daffodil Competition.—At the Royal Horticultural Society's meeting on Tuesday, the 14th inst., a silver cup, of the value of seven guineas, will be offered by Messrs. Barr and Sons for a group of daffodil blooms grown entirely out of doors. The group must contain representatives of each section—magni, medio, and parvi-coronati—and not less than thirty distinct varieties. Not less than three or more than nine blooms of each variety must be staged, and any hardy foliage may be used. Past winners of the cup may compete, but will not be eligible to receive the cup more than once in three years. In the event of any previous winner being placed first he will be awarded a medal, and the cup will go to the exhibitor of the next best group should it be considered of sufficient merit.

Royal Visits to Gardens.—On Tuesday afternoon the Queen and the Empress Marie, accompanied by the Princess Victoria, visited the Royal Gardens, Kew, and spent some time in the inspection of the more noteworthy of the many objects of interest. The gardens are now rapidly putting on their spring dress, and afford an excellent foretaste of the beautiful displays of spring flowers in the grass and elsewhere that visitors will have the opportunity of enjoying during the Easter holidays. On Wednesday afternoon their Majesties visited the gardens of the Royal Botanic Society, Regent's Park.

Extraction of Essences of Flowers.—The Italian Government offer prizes amounting to £400 for the most economical process of extracting the essence of bergamot and lemon for commercial purposes. The different processes submitted for competition will be subjected to systematic trials by a special commission, and the expenses in connection therewith will be defrayed by the Ministry of Agriculture, to whom entries must be made not later than January 1, 1909.

R.B.S. and its Late Gatekeeper. It will be remembered by many of our readers that Parkes, the gatekeeper at the principal entrance of the Royal Botanic Society's gardens, Regent's Park, retired in September, 1906, after 60 years' service. As Parkes was in his 78th year, and had discharged his duties in a most satisfactory manner, and the society was not in a position to provide a pension, the council invited subscriptions from the Fellows to a testimonial to be presented to him. It was suggested in the circular sent out that "a purse of money will be the most suitable gift." The response to the circular was so liberal that the sum of £500 was received. The council hesitated to pay over so large an amount, and suggested that an annuity be purchased for Parkes and his wife, and they issued a circular to the subscribers asking them whether they agreed to the suggestion. A large majority of the subscribers did not send any reply, and the council considered the matter settled. The amount contributed by the dissenting subscribers was handed to Parkes, and the council was prepared to provide an annuity of £50 for Parkes and one of £26 for his wife should she survive him. Parkes expressed the wish to receive the testimonial in a lump sum, and subsequently commenced legal proceedings. The case came before Mr. Justice Eve, in the Chancery Division of the High Court of Justice, on the 3rd inst., in the form of a motion for an injunction to restrain the society from dealing or parting with the money, which the council were willing to pay into Court. The Judge decided in favour of Parkes, and in the course of his judgment said, the subscriptions were asked for in order that the money might be applied in a certain way, and as soon as it was received it became a trust fund for the benefit of Parkes, who had a right to ask that it be handed over to him.

Bird Protection.—At the annual meeting of the Royal Society for the Protection of Birds, which was held a few days since, Lord Stamford, who presided, stated that inquiries flowed in continuously for additional watchers and for help in watching, for inspectors, for lecturers, for further educational work in the schools, for effort in connection with Imperial and county enactments, for investigations, appeals, and for prosecutions. Communications with the Home Office had elicited the reply that, if a Bill on the subject of the protection of wild birds was introduced during the present Session of Parliament it would be a consolidation Bill. Having regard to the terms of the letter, it was not considered advisable to press for legislative enactments until a strong consensus of opinion clearly and definitely indicated the lines on which such changes would be most judicious and effective. The need of purely educational work became more and more apparent to all who had the cause of the protection of birds at heart. In recent years they had had encouragement from the highest quarters. Mr. Montague Sharpe said that before further legislation was introduced it was advisable to obtain additional information, and with that object the society's gold medal was being offered for the best essay on "Comparative Legislation for the Protection of Birds."

National Flower Show in America.—The National Flower Show, to be held by the Society of American Florists and Ornamental Horticulturists in the City of Chicago, November 6 to 15, 1908, inclusive, will, we are informed, be the largest and most extensive exhibition of plants and flowers ever undertaken in the United States. All the horticultural interests of the Continent will be brought to bear to make it noteworthy and interesting. The plantsmen and allied interests have subscribed a guarantee fund of 13,000 dollars, insuring all expenses and premiums, and about 8,000 dollars in cash prizes and numerous cups and medals will be awarded. This committee cordially invites foreign plantsmen having new and rare plants to take this opportunity to exhibit the same to the American public. Suitable awards will be given to all deserving new plants or horticultural devices which may be sent for exhibition. Mr. E. G. Hill, of Richmond, Ind., is the chairman of the Committee on Foreign Exhibits.

Continental Potatoes in England. During 1907 the Agricultural Department of the University of Leeds tested several Continental varieties of potatoes that possess a high reputation as disease resisters. These varieties were Daisy, a Dutch variety; and Professor Wohltmann and Apollo, of German origin. It was found that these varieties fully sustained their reputation for disease resistance, but they produced only half a crop as compared with British varieties. Stuntney Surprise and Up-to-Date were home-raised varieties that were not diseased, but all other British varieties were more or less affected.

Royal Agricultural Society's "Journal" for 1907 has been published within the past few days, and is remarkable alike for the admirable manner in which it is presented and the great interest of its contents. While wholly devoted to agricultural matters, there are several articles that well deserve the careful attention of horticulturists, more especially those on "Useful and Injurious Wild Birds," by Mr. C. F. Archibald, and "Injurious Fodder and Poisonous Plants," by Mr. H. T. Güssow.

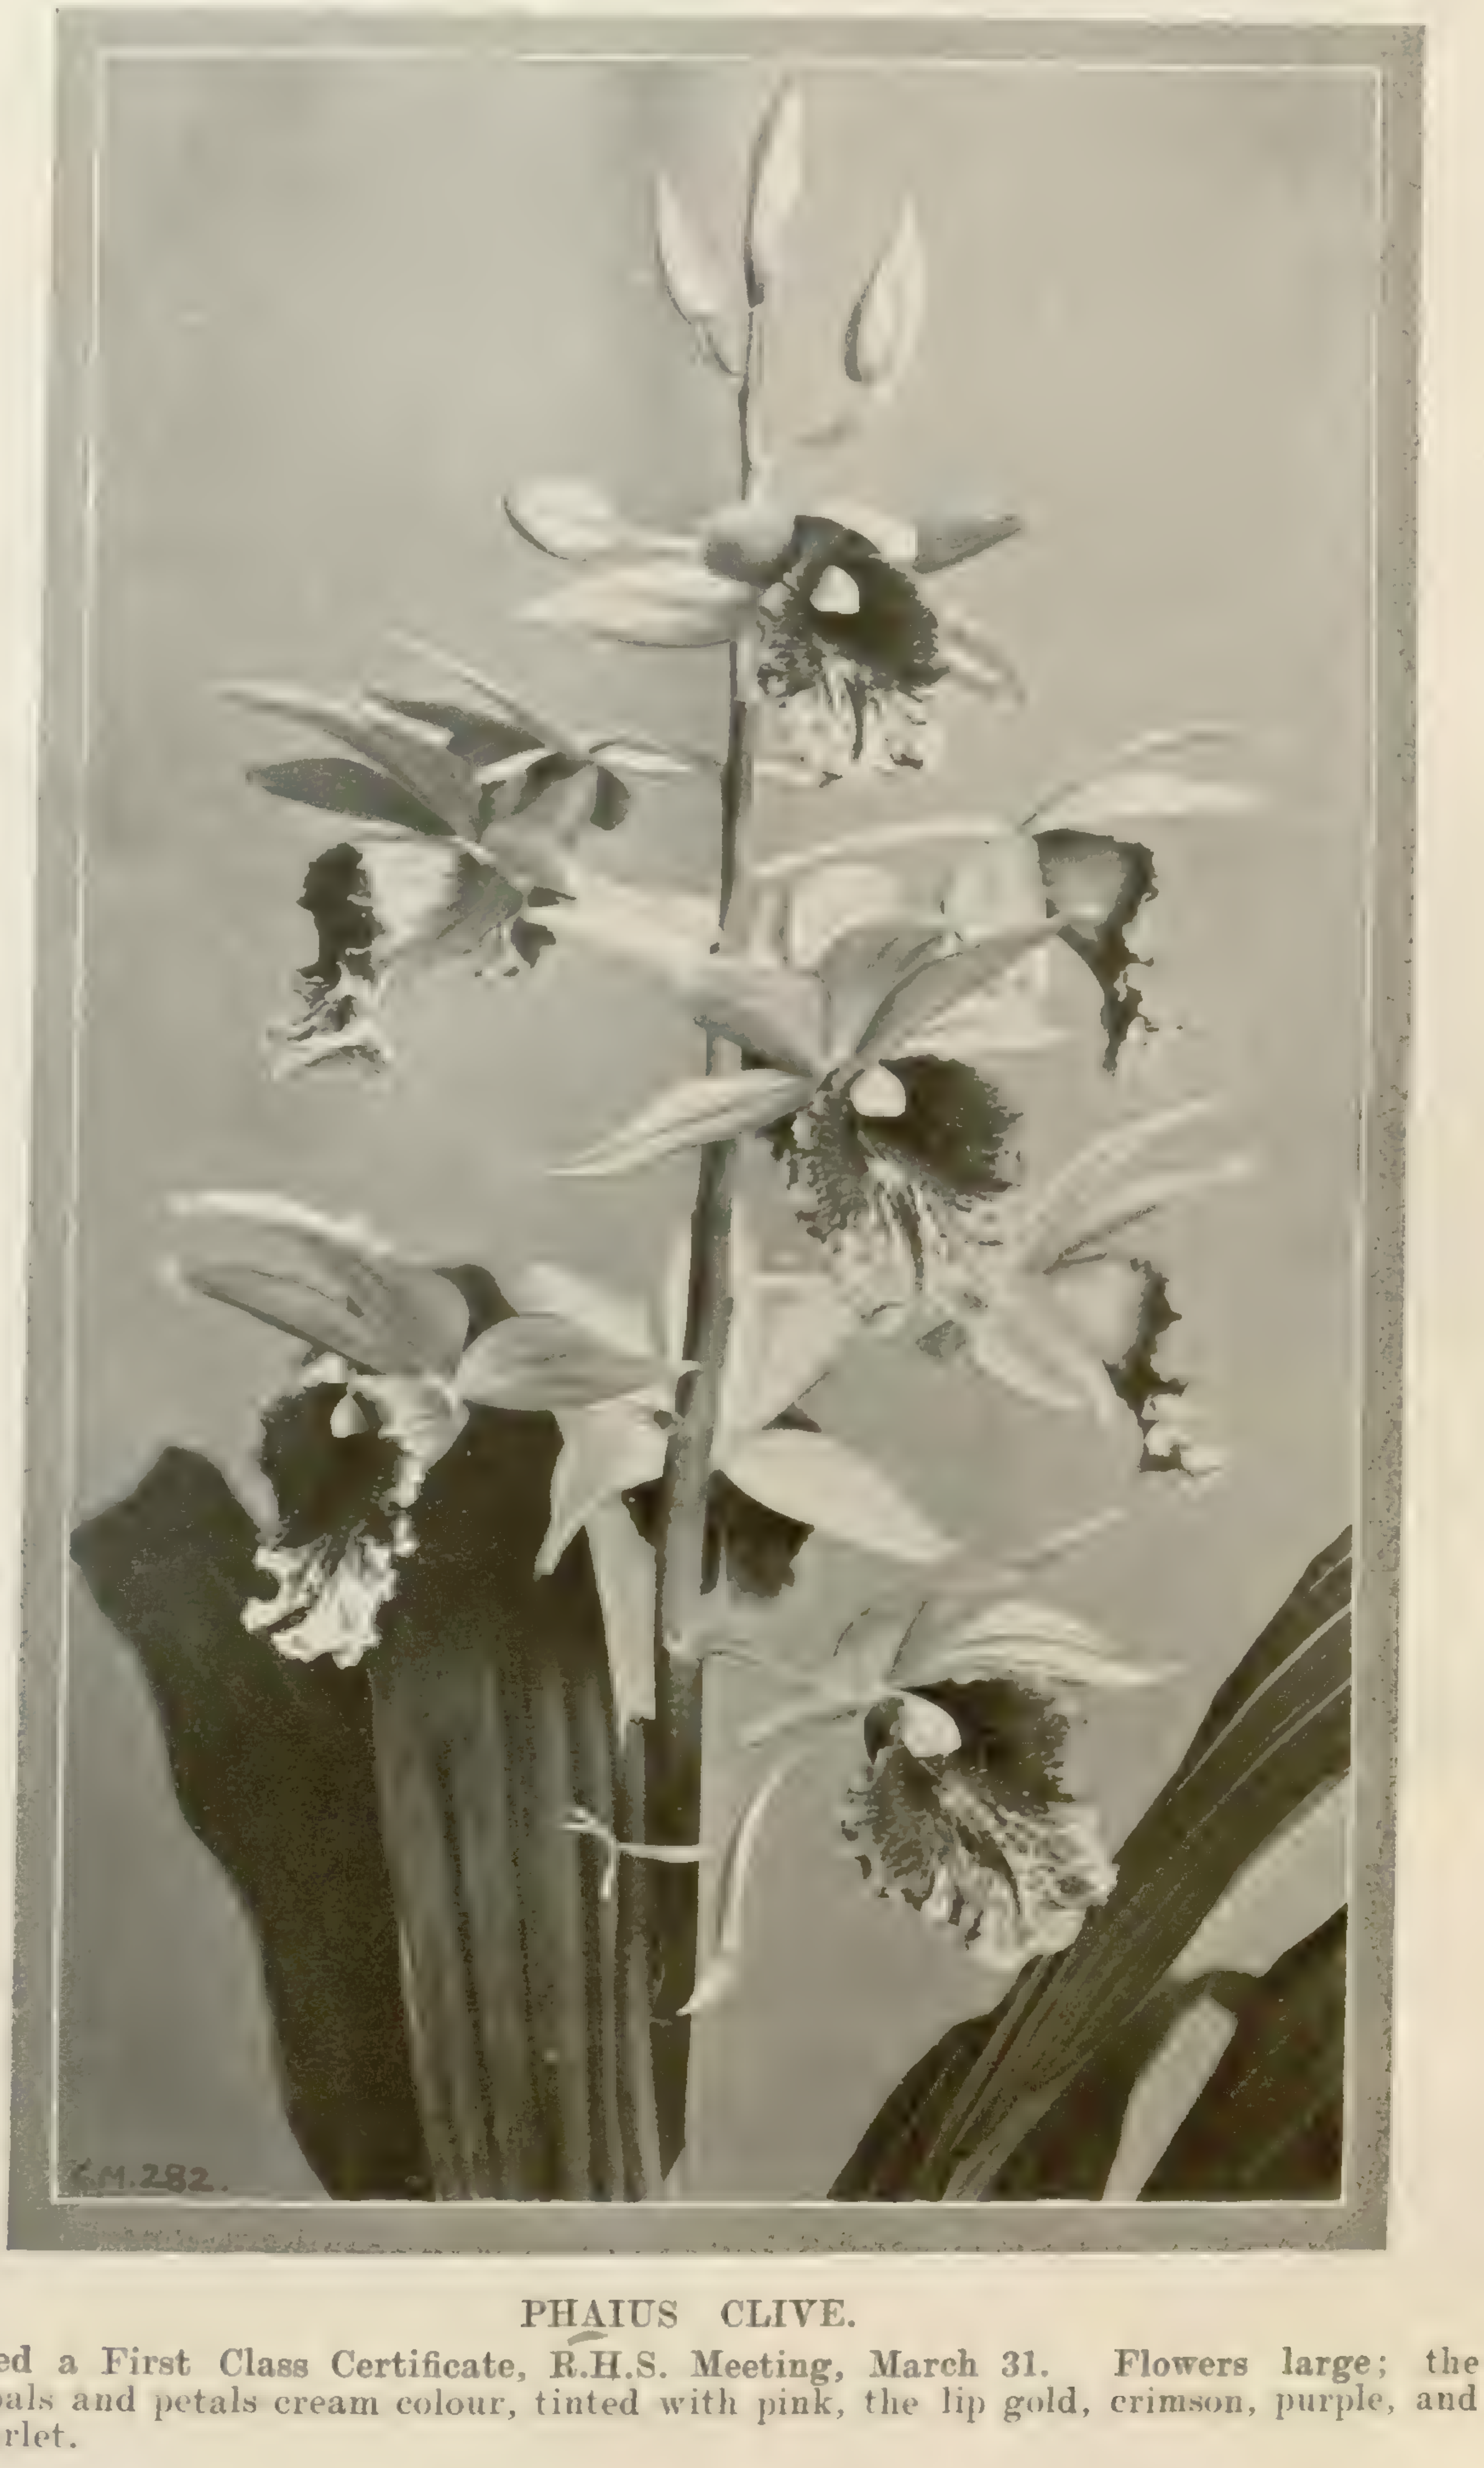
Grass Culture of Fruit Trees.—During the past three years experiments have been conducted at the Harper Adams Agricultural College, Newport, Salop, for determining the growth of fruit trees when planted on grass as compared with trees growing in cultivated ground. The report is now before us, and from this we learn that Messrs. Dickson and Co., Chester, presented twenty-four apples for the purposes of the experiment, eight each of Bismarck, Bramley's Seedling, and Cox's Orange Pippin. These were planted in four rows, two trees in each row. The grass upon which the trees are planted is manured regularly with farmyard and artificial manure, the grass is mown and removed, while special manures are used on the cultivated portion for each crop. The difference between the trees on grass and those on cultivated ground has throughout been very marked. Growth during 1907 averaged about twelve inches in the trees on grass, while the trees on the cultivated land made an average growth of twenty-five inches. The trees were measured at a distance of four and a-half feet from the ground, and the result of this measurement is summarised in the report and compared with the diameter of the trees in 1905 and 1906, and with reference to this it is of interest to observe that the relative increase was much greater in 1907 than in the two previous years. At the commencement of the year last mentioned the experiment was modified by removing from around the stems of alternate trees on grass a square of turf. The surface ground laid bare (four square yards to each tree) was forked over without disturbing the roots, and kept free from weeds throughout the year. "The effect of this treatment was," we are told, "soon visible, and the growth made during the summer was strong and healthy."

Natal Botanic Gardens.—The Natal Government have found themselves obliged to reduce the expenditure upon the Natal Botanic Gardens and the Herbarium. The grant to the Herbarium has been taken away entirely, whilst the grant to the gardens has been reduced from £350 to £150. This action has, says the "Kew Bulletin," necessitated the discharge of two of the assistants and a considerable reduction in the salaries of the director and his curators. It is difficult to see how the important work of the department can be carried on effectively under these straitened circumstances.

NEW PLANTS, ETC.

PHAIUS CLIVE.

A beautiful and striking orchid, obtained by crossing Phaius Norman with Phaius tuberculosus. P. Clive apparently grows freely, and it produces a tall spike that carries numerous attractive flowers. The sepals and petals are creamy, tinted with pink, and the fine lip is a wonderful combination of gold and crimson and scarlet and purple. F.C.C., R.H.S., March 31. Mr. H. J. Chapman, orchid grower to Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne.



PHAIUS CLIVE.

Awarded a First Class Certificate, R.H.S. Meeting, March 31. Flowers large; the sepals and petals cream colour, tinted with pink, the lip gold, crimson, purple, and scarlet.

CYPRIPEDIUM HELEN II. WESTONBIRT VAR.

This is a very large and bold cypripedium, but it lacks distinctive colouring. It is like a pale C. insigne Harefield Hall var., with broadened tips to the petals and a rounded lip. The colour is greenish, with dull purple spots and shading. It is one of the largest hybrid cypripediums. F.C.C., R.H.S., March 31. Mr. Alexander, orchid grower to Major Holford, Westonbirt, Gloucester.

ODONTOGLOSSUM PERCULTUM J. R. ROBERTS.

A handsome odontoglossum with large shapely flowers set rather closely on a big spike. There were fourteen flowers on the plant staged. The sepals and petals are light rosy-lilac, freely marked with deep and bright red-brown, the markings being largest in the centre of the segments. The lip is similarly coloured, with a yellow disc. A.M., R.H.S., March 31. Mr. Davis, gardener to J. Gurney Fowler, Esq., Glebelands, South Woodford.

CATTLEYA SCHRODERÆ QUEEN ALEXANDRA.

An exceptionally fine form of this useful and fragrant cattleya. The flowers are large, finely proportioned, and stand up well. The sepals and petals are pale lilac, while the large lip has an orange-yellow throat, with a zone of light bluish-purple between it and the paler apex. A beautiful orchid. A.M., R.H.S., March 31. Messrs. Sander and Sons, St. Alban's.

CATTLEYA SUZANNE HYE DE CROM JUNGFRAU.

Another wonderfully beautiful white cattleya, with very large, finely-formed flowers that are pure white, but have a clear soft yellow throat and a broad labellum. F.C.C., R.H.S., March 31. Mons. J. Hye de Crom, Ghent.

RHODODENDRON PURITY.

A large-flowered greenhouse rhododendron, somewhat similar to R. fragrantissimum. The blooms are broad and beautifully shaped, the divisions of the corolla mouth being prettily rounded. The flowers are very substantial, and of the purest whiteness, with a small pale lemon-yellow mark on the lower segment. A.M., R.H.S., March 31. Mr. Charles Turner, Slough.

VIOLA GRACILIS.

A charming species, with neat spathulate leaves and bright purple, crimson-shaded flowers. The latter are carried well above the leafage, on stout, erect footstalks, and they are freely produced. It is a Grecian plant, and one that should commend itself to lovers of the smaller hardy subjects. A.M., R.H.S., Messrs. R. Wallace and Co., Colchester.

VIOLA GRACILIS.
A beautiful species, native of Greece, which received an Award of Merit at R.H.S. Meeting, March 31. Flowers, bright purple, shaded crimson.

SHORTIA UNIFLORA.

A dainty little alpine from Japan. It is not new, but as yet it is not largely known. About three inches high, it produces fairly large, pale pink flowers, that are prettily frilled. A.M., R.H.S., March 31. Messrs. R. Wallace and Co., Colchester.

IRIS SIND-PAR AMETHYST.

This beautiful dwarf iris is the result of crossing Iris sindjarensis with I. persica purpurea. As shown, it is less than six inches high, but the flowers are large and very attractive; the colouring is purple-blue, the falls being especially rich and bright. I. amethyst is one of the prettiest members of a beautiful race. A.M., R.H.S., March 31. Mr. C. G. Van Tubergen, jun., Haarlem, Holland.

POTATOES AND THEIR CULTURE.

(Concluded from page 260.)

Those who plant potatoes on warm, sunny borders for early supplies must be on the alert for the appearance of the tops above ground, this being the signal for drawing a slight ridge of soil over the tops as a protection against night frosts, as many of the early sorts only make one growth from each eye, and the growths do not branch, consequently it is of the first importance that their tips are not injured in any way. A sprinkling of dry strawy litter will answer the same purpose, but its removal by day and return at night gives more trouble, and it is only advised in special cases: in fact, the struggle after very early potatoes is not to be generally recommended, as the trouble they give, except in the very mildest districts, is seldom repaid by the results, unless frame culture pure and simple can be indulged in.

Hoeing and Earthing.

Returning to the main crops, when these are about four inches above ground, or before this if weeds are showing plentifully, the whole surface should be hoed through, choosing a time when the soil is in good working condition, and taking care not to injure the stems. This hoeing will assist growth, and will leave the ground in good condition up to the time when the important operation of "earthing up" should be taken in hand, this being done as soon as the growth is tall enough to allow of the necessary ridge of soil being pulled up to the stems from the space between the rows.

If earthing up is not done early the chances are that the tops will have fallen over, and this makes the work more difficult, and the danger of injury much greater. A point to remember is that earthing up should not be done when the soil is in very dry condition, as this would let the drying air into the roots and newly-formed tubers, which, under such conditions, would experience a great check. The soil should be in that state which is known as "neither wet nor dry," a much-desired state to the cultivator of all garden crops.

The form of the ridge of soil when finished is an important point. Had we no disease to contend with one would recommend a ridge with a flat top, but as this would catch any disease spores washed down by rain from the tops, it is advisable to bring the ridges to a sharp angle at the apex, so that any spores washed down would be washed away from the tubers, and not towards them.

Spraying and Lifting.

After earthing up, the next important item of culture is that of spraying the foliage above and below with Bordeaux mixture, or some modification of this as a preventive of disease. This spraying should take place about the end of June, and if thoroughly done it should not need repetition, though in some cases and seasons it may be wise to spray a second time a month later.

When the haulm has sufficiently ripened lifting should take place as soon as possible, as the longer the tubers are left in the ground the more likely are they to suffer from disease, as by this time of the year disease spores will be floating in the air ready to become active on reaching their host, for disease prevention is not universally adopted, and the spores from a distant field may easily be carried to tubers exposed by lifting. For the same reason the tubers should be gathered up immediately they are lifted, and not allowed to lie on the surface to dry, for if the proper weather is chosen for lifting operations they should be quite dry enough for storing.

Storing.

Storing may mean placing the tubers in a cool shed or a cellar, the cooler the better, provided it is frost-proof; or it may mean putting them in a clamp in the open. Clamped potatoes keep well if the clamp is properly made. The heap should be made on the level ground, the tubers being first covered with dry bracken, and on this several inches thick of soil should be thrown, the soil being provided by throwing out a trench all round and almost close up to the heap. This leaves the tubers in a high and dry position, and if sufficient soil is put on them to keep out frost no system of storing could be better. The only drawback to this system of storing is difficulty of access in frosty weather, without letting frost reach the tubers, but this is avoided by choosing mild weather for getting out the requisite quantities to meet any emergency, and by carefully closing up the clamp after each visit.

Potatoes stored in sheds and cellars will require occasional overhauling, after midwinter is past, to rub off any young growths that may be forming at the expense of the tubers. This is especially the case where the store is warmer than it should be.

J. C. Tallack.

Shipley Hall Gardens.

The Hyacinths exhibited at the Horticultural Hall on Tuesday week in competition for the prizes offered by the bulb growers in Holland fell short of expectations, and some disappointment was felt by our Dutch friends. Possibly the results would have been much better had the donors offered the prizes early in the autumn, and freely advertised the fact that arrangements had been made for a competitive display, and thus enabled growers to make their arrangements accordingly.

SOME NORWICH GARDENS.—I.

Having had many opportunities for visiting Norwich in connection with horticultural matters, and always under the most pleasant conditions, and of seeing a goodly proportion of the numerous fine gardens in the vicinity thereof, I have for a long period been very favourably impressed by the city. With a fuller acquaintance with that section of the community specially interested in gardening, the impression received many years ago has become so deepened that I could unhesitatingly say, as was said by Queen Elizabeth when leaving the city after her historical visit in 1578, "I have laid up in my heart such goodwill as I shall never forget Norwich."

TERRACE GARDEN, GUNTON PARK.

The city has much to commend itself to the notice of those who take an interest in the history and development of the great populous centres that form so important a feature of England. It is rich in archæological and historical associations, contains many important public buildings, a richly-furnished museum, and more churches than any other city of the same size in the United Kingdom, chief among them being the cathedral, which for several centuries has been one of the most conspicuous landmarks in this part of England. The museum is especially rich in specimens illustrative of the science of ornithology, the collection of birds of prey being considered by those who are well able to speak with authority as one of the finest in the world, while British birds are represented by a collection remarkable for its completeness. Here there is also a fine series of mammalian remains from the forest beds along the Norfolk coast, and especially in the neighbourhood of Cromer. These remains include several species of elephants, hippopotamus, rhinoceros, the mastodon, and other animals that ranged over the vast area of which the British Isles formed a part when tropical conditions obtained over the northern parts of Europe. The museum also contains a valuable herbarium, wherein are specimens of all the British plants, and a good library of botanical books.

Mention of the herbarium and comprehensive botanical library recalls to mind the fact that Norwich can boast of having been the birthplace of three botanists, who attained to the highest distinction, and will ever be remembered by botanists of this country for the splendid services they rendered to botanical science. These were Sir James Smith, M.D., the founder and first president of the Linnean Society, and the author of "Flora Britannica," "Flora Græca," and other works of considerable importance in their day; Sir William Hooker, who for many years was director of the Royal Gardens, Kew, and did much to place them in a foremost position among the botanical establishments of the world; and Dr. Lindley, the author of numerous works relating to botanical science, and for many years an active member of the governing body of the Royal Horticultural Society. Considering the immense influence for good these three great men exercised on the study of plant life, it is very gratifying to know that the interest in botanical science is at the present time kept fully alive at Norwich.

The East Anglian Horticultural Club, which has its headquarters in the city, established a botanical section some years ago, and this, under the skilful direction, chiefly of Mr. E. Peake, has proved highly successful. Meetings are held at regular intervals, and are well attended, many members coming long distances without regard to the weather being favourable or otherwise to cross-country journeys. With a membership of upwards of three hundred, the club is one of the strongest of the many gardeners' associations in the country, and, as the result of a well-devised policy, the monthly meetings are well attended, and a keen interest evinced in the proceedings. While the East Anglian Horticultural Club is engaged in keeping horticulturists in the district in close touch with each other, and affording them facilities for discussing matters that have a bearing on the practical work of the garden, the Norfolk and Norwich Horticultural Society gives them opportunities for the display of the products of their skill. This society, of which Mr. W. Smith is the able secretary, is splendidly managed, and its exhibitions held in the spring, summer, and autumn are models of what competitive gatherings should be. Some sixty-five years ago the first chrysanthemum show in this country was held at Norwich, and last November one of the finest exhibitions of the season was held in the city, and the devotees of the "Queen of Autumn" have shown a degree of constancy that is probably unique; but if that be not the case, it is deserving of the heartiest commendation.

Mention has thus briefly been made of the keen interest that is now being taken in and around Norwich in the various aspects of horticulture, because of it having been long known as a "city of gardens," and the gratification that is derived from the evidence on all sides that at the present time gardening is being conducted on lines worthy of the city's traditions. How long Norwich has been called a "city of gardens" it would not be easy to say, but Fuller, in referring to the gardens, writes, "to which the Dutch brought not only their profitable crafts, but pleasurable curiosities, being the first who advanced their use and reputation here. Great is the art of ameliorating them, and the Rose of Roses (Rosa Mundi) had its first being in the city." Norwich appears to have greatly impressed Evelyn, who, as so well known, was keenly interested in gardening, for after his visit he described it as "One of the largest, and certainly after London one of the noblest, cities of England. . . . The suburbs large, the prospects sweet, with other amenities, not omitting the flowers, in which all the gardens excel." Not only were flowers largely and most successfully cultivated in the gardens in and around Norwich, but the banks of the Yare were at a very early period celebrated for the growth of vegetables for market, and Drayton, not to be deterred by the prosaic character of a market garden, has recorded their fertility in verse.

BOWERS OF RAMBLING ROSES, GUNTON PARK.

Whatever may have been its claims to the title of a "city of gardens" in bygone days, there can be no question that Norwich is fully entitled to such designation at the present time. In and near no English city is gardening more extensively and successfully carried on, and where the pleasure derived therefrom is so freely participated in by all classes of the community. The streets in the centre of the city are rather narrow, and somewhat perplexing in their arrangement, but the roads that radiate from the city boundaries in various directions are of great breadth, and remarkable for the fine gardens with which they are flanked, and their picturesque appearance. These gardens are varied in size and arrangement, but they are invariably well kept, and from the opening days of spring to the closing days of autumn they are gay with flowers and rich in sylvan charms. Especially are they noteworthy for the succession of delights they afford those who walk or drive along the road in the season of roses, for these flowers revel in the climatic and soil conditions that obtain. There are villa gardens well nigh innumerable alongside the principal roads, and no great distance from them are numerous gardens of the first rank. To the south of the city are the gardens of Dunston Hall, Keswick Hall, and Shotesham Park; to the south-west those of Ashwellthorpe Hall, Boyland Hall, Colney Hall, and Oakland House; to the south-east those of Crown Point; to the north-east Blickling Hall, Gunton Park, Rackheath Park, Sprowston Hall, Westwick Hall, Worstead Hall, Wroxham Hall; and to the north Catton and Stratton Strawless Parks. The number of good gardens is indeed so large as to render it practically impossible to describe and illustrate all of them in a manner adequate to their importance. To have made a selection from them in exact accordance with their merits would have been extremely difficult; and all that will be attempted will be to briefly describe gardens that are fully representative of the district, and that could be the most readily visited in the time at disposal.

Gunton Park.

The gardens of Gunton Park, the seat of the Hon. Colonel Harbord, have, as the result of the splendid work that has been accomplished in them, been regarded for thirty or more years as one of the most important and best-kept horticultural establishments in the United Kingdom. The high reputation the gardens have so long enjoyed is fully maintained, and it is well within the mark to say that at no time during the long period over which the writer's acquaintance with them has extended have they possessed greater interest or afforded so striking an example of high keeping. Gunton Park gardens are well and widely known, but for the information of those who are not acquainted with the exact whereabouts of this fine seat, it may be stated that Gunton Park is situate about fifteen miles to the north-east of Norwich, and is about two miles from Gunton station, on the line of railway between the city and Cromer. The district is remarkable alike for its fertile soil and high farming, and both cereals and root crops are grown with much success, and contribute in no small degree to the great charms of the landscape at the season of the year when the summer merges into autumn. On the way from Gunton station, and also from Cromer, some five miles distant, one, however much the mind may be occupied with matters horticultural, cannot fail to make mental note of the large open fields, with their neatly-trimmed hedges and thriving crops.

The mansion occupies a commanding position on the high ground near the centre of the splendidly wooded park, which has an area of about 1,700 acres. The aspect is due south, and from the broad terrace on the garden front are obtained views of surpassing loveliness. In the making of the glorious pictures that are obtained from the terrace and other points of advantage in the grounds, woodland and water, rolling meadow and cornfield, and specimen trees enter into their composition, and contribute their full share to the distinctive beauty of the scenery. In the finely-wooded park beeches and oaks, silver firs and Spanish chestnuts predominate, and, for the most part, they are represented by trees of noble proportions. In the plantations that bound the extensive pleasure grounds are many hundreds of trees of the kinds mentioned in the highest state of development, with numerous fine examples of other kinds. These plantations are not only of interest for the many fine trees and shrubs they contain, and for the delightfully cool retreats they afford when the summer's sun is at the zenith of its power, but they are of immense value as shelter from the winds from the north and north-east, that sweep across the country with terrific force at certain seasons of the year.

East of the mansion is an immense sweep of lawn, as indicated in the illustration, and this would well serve as a model of what an expanse of turf associated with a great house should be. In the foreground the beds, filled with lavender, Veronica Traversi, and other subjects remarkable for their quiet colouring, have a charming appearance; and on the opposite side of the lawn are bold, tastefully arranged groups of coniferous trees and shrubs with glaucous and golden leafage. On the west side of the mansion the pleasure grounds extend for an immense distance. Contiguous to the mansion is the spacious tennis ground, and immediately beyond, but somewhat secluded, is a beautiful arrangement of trees and shrubs remarkable for their elegant habit or distinctive leaf colouring. Here also is a remarkably fine avenue of bamboos, formed with Arundinaria japonica (Bambusa Metake) and A. Simoni. The bamboos are in the most vigorous state of health, and have a height of fourteen or fifteen feet, and the avenue, which leads up to an ancient yew, is at once graceful and imposing. Of late years a considerable amount of thinning has been done in the plantations and shrubbery borders on the west side, and a material improvement thereby effected, inasmuch as many fine views over the park have been opened out, and several delightful peeps of the lake obtained.

The terrace garden on the south side of the mansion is one of the most attractive of the many good features of the gardens. We can well remember the rich effects that were produced in this garden by the massing of tender bedders, and the time when these had to make way for hardy herbaceous plants, but we are unable to call to mind any arrangement of so pleasing a character as that of last year. The accompanying illustration so clearly shows the materials used, and the method of arrangement adopted, that description is quite unnecessary. It should, however, be mentioned that the border at the foot of the terrace wall is planted with rambling and dwarf roses, and as the conditions are well suited to their requirements they grow vigorously and bloom profusely. The rose bowers at the east end of the terrace garden present a delightful appearance, and there should be many gardens in which a similar arrangement might be made for the cultivation of rambling roses. Varieties new and old have been utilised in clothing the bowers, and the borders between them have, as shown in the illustration, been filled with roses of dwarf growth. The rose bowers and pillars were erected by Messrs. Barnards, Lim., Norwich, from Mr. Allan's design, and are not less remarkable for excellent workmanship than for their elegance.

The kitchen garden is some distance to the east of the mansion, and herein one might linger long, for here are the vineries, in which have been produced the grapes with which Mr. W. Allan, who has long been in charge, has achieved his many triumphs at the international and other great gatherings. There are four vineries, with a combined length of one hundred and twenty feet, and herein have annually been produced heavy crops of splendidly finished grapes. Within them have also been conducted many experiments in the grafting of vines, and all of interest in their bearing upon grape culture, but space will not admit of their being referred to in detail at the present time. The peach and fig houses, if somewhat less interesting than the vineries, are not less remarkable for the results obtained from them, as the crops are invariably heavy, and of the highest quality.

VIEW IN PLEASURE GROUNDS, GUNTON PARK.

The hardy fruits in the open are also of exceptional interest, for, as demonstrated by the collections contributed to the leading exhibitions, Mr. Allan is a past master in the art of pear culture. The district is not specially adapted to the cultivation of choice pears, one of the great drawbacks being the east and north-east winds, which in this corner of Norfolk are very destructive in their effects upon tender vegetation. Yet the pear trees are models of their kind, and produce an abundance of finely-finished fruits. Mr. Allan has raised several strawberries remarkable for their high flavour, and he has specially distinguished himself in the art of discovering good fruits. He was perhaps the first of the cultivators to recognise the merits of President Barabe pear, which ripens at Christmas, and has no equal for flavour at that season, and bring it into prominent notice, and he was certainly the first to discover the merits of the Norfolk Beauty apple, one of the finest of all the culinary varieties, and now rapidly coming into general cultivation. A more recent achievement in the same direction is the Blickling pear, which, on being submitted to the Fruit Committee of the Royal Horticultural Society, in January, 1907, received distinction as in the case of the apple.

In the kitchen garden also are great breadths of carnations and roses for the supply of cut flowers, and recently has been erected by Mr. A. Harris, horticultural builder, of Ealing, a large span-roof house for the cultivation of American carnations in accordance with modern methods, and from this structure thousands of splendidly developed blooms are obtained annually. While entering heartily into carnation culture under glass, Mr. Allan does not appear to have in any way abated his interest in violets, for at the Norwich Exhibition in November last we found him, as usual, occupying the premier position with these fragrant flowers.

THE HIMALAYAN BRIAR ON PERGOLA, WESTWICK HALL.

Blickling Hall.

This, the Norfolk seat of the Marquess of Lothian, affords much that is of antiquarian and horticultural interest, and is moreover so rich in historical associations, and remarkable for the beauty of the scenery within its boundaries, as to be well able to give abundant pleasure to visitors with tastes of a widely divergent character. In visiting Blickling Hall one is reminded that Aylsham, one of the most interesting of the towns in the district known as the "Garden of Norfolk," and about one and a-half miles distant, was, during the reigns of Edward II. and Edward III., one of the principal seats of the linen trade, and that later it acquired considerable fame for its woollen manufactures. It need not be said that these industries have long since disappeared from the town, and that its commerce is now limited to meeting the requirements of the residents of the agricultural district of which it is the centre. The only evidence of the position occupied by Aylsham as an industrial centre is that afforded by the numerous handsome houses of red brick on the outskirts of the town that were once the residences of the manufacturers, and are now occupied by families who appreciate the charms of country life and the fine bracing air for which this part of the country is famous. Aylsham Church is not less interesting to horticulturists than to archæologists, for in the churchyard are the remains of Humphry Repton, who died exactly ninety years ago. On the tablet which marks the position of the grave of this great landscape gardener are the following lines:

> "Not like Egyptian tyrants consecrate,
> Unmixed with others shall my dust remain;
> But mold'ring, blending into earth,
> Mine shall give form and colour to the rose;
> And while its vivid blossoms cheer mankind,
> Its perfumed odours shall ascend to heaven."

Blickling Hall, some twelve or thirteen miles north of Norwich, is readily reached from either Aylsham Town or Aylsham railway stations. The second of the two is considerably the nearest, but the first-named has the advantage of giving the visitor an opportunity of paying respect to the memory of Repton, who, in his day, did so much to give breadth and beauty to the English landscape. Blickling Hall is generally considered one of the finest brick mansions in this country, and the front, with its broad approach flanked on either side by rows of clipped yews and limes, is highly picturesque and decidedly beautiful. Chief Justice Hobart laid the foundation of the mansion, which was completed in 1868, but the west front was rebuilt about the middle of the eighteenth century owing to a portion having been destroyed by fire. Sometime the seat of the Boleyns, and, according to Blomfield, the birthplace of Anne Boleyn, the second wife of Henry VIII., who lived there until 1512, Blickling is especially rich in historical associations, but with those it is not within the province of these notes to deal.

The environment of this fine old mansion are in admirable keeping with it. The park and pleasure grounds extend over upwards of 1,000 acres, and are splendidly wooded, the most noteworthy of the trees being beeches, cedars, firs, oaks, and pines, with not a few planes, that, like the other trees mentioned, have attained to noble proportions. Within the park is a lake a mile in length and of proportionate width; and it has been so skilfully disposed that from whatever point it is seen it is found to contribute immensely to the charm of the beautiful landscape.

The delightful old-time flower garden, some two acres in extent, is situate on the east side of the mansion, which has a very stately appearance as seen from the far side of the garden, with the beds of flowers and shrubs as a foreground. The garden is devoted chiefly to hardy herbaceous plants and other perennials of bold growth, and those which are quite hardy are taken full advantage of. The beds are on the grass, which is intersected by broad gravel walks, and the bold masses of hardy and half-hardy plants they contain produce during the summer and early autumn months an effect that is not only delightful in itself but is in keeping with a mansion that has a history extending over between three and four hundred years. Interspersed with the beds of flowering and ornamental-leaved plants are yews, thuias, junipers, and other conifers that can be kept to a small size and formal in outline with shears or knife. Specimen flowering plants in tubs are fully utilised, and as Mr. Oclee, who has long had charge of these famous gardens, is especially successful both in their production and disposition, they enhance in no small degree the general effect.

Contiguous to the flower garden are clipped hedges and other fine examples of topiary work that are admirably in keeping with the general scheme. The pleasure grounds are chiefly to the east of the mansion, and are surrounded on three sides by a broad terrace, from which magnificent views are obtained over the park with its glistening lake, and the surrounding country, which hereabouts is finely wooded and well diversified. Within the pleasure grounds are fine masses of choice rhododendrons, which grow with remarkable vigour in the strong loam characteristic of the district, and bloom profusely. Surrounding the pleasure grounds are plantations through which green drives have been formed, and these provide delightful retreats in summer weather, and afford charming peeps of the stately mansion from various points.

The numerous plant and fruit houses are located in the kitchen garden, to the west of the mansion, and form a feature of much interest, as will be readily understood when it is stated that Mr. Oclee has long enjoyed a high reputation for his skill as a cultivator of both flowers and fruit. Peaches and grapes are especially well grown on an extensive scale, and the several spacious structures devoted to these important fruits afford each season object lessons of much value to the less experienced cultivators who have an opportunity for visiting these gardens. The walls of the kitchen garden are, in accordance with the practice that obtains, clothed with fruit trees, and a considerable area of border space is devoted to hardy flowers, those suitable for the supply of cut flowers being strongly represented.

Westwick Hall.

Situate within a short distance of the historic village of Worstead, once the centre of the worsted industry in this country, and now famous for its large and beautiful church, Westwick Hall, the fine seat of Major Petre, takes high rank among the great houses in the north-eastern corner of Norfolk that are remarkable for the extent and interest of their gardens.

A BEAUTIFUL ARRANGEMENT OF HERBACEOUS PLANTS, WESTWICK HALL.

Westwick Hall is about two miles distant from Worstead station on the Norwich and Cromer branch of the Great Eastern Railway, and the walk or drive thence through the finely wooded and rolling country characteristic of the district is extremely pleasant. If the way to the gardens is pleasant, a walk through them is doubly so, for Major Petre takes a keen interest in all that relates to them, and encouraged by the generous appreciation of his employer, Mr. George Davison has been so lavish in the skill that he has brought to bear on them that they have become famous throughout the country. In mentioning this it is of interest to recall the fact that the owners of Westwick Hall have for several generations past devoted close attention to their fine estate and beautiful gardens, and that Mr. Davison has had his father and grandfather as his immediate predecessors, and occupies a position that is probably unique, and if this be not the case, the position is one that is by no means common. As far back as 1841 we find in the Gardeners' Magazine Mr. J. Grigor expressing his opinion that "The horticulturist and florist will be equally delighted in visiting this seat, the general excellence of which must strike everyone."

What was true of Westwick Hall sixty-seven years ago is true at the present time, for within the gardens there is plenty to interest the visitor, whatever may be the trend of his taste. The fine old creeper-clad mansion has an admirable setting of widespreading lawns, admirably arranged shrubberies, stately deciduous and coniferous trees, and at a short distance from it is an extensive lake, which contributes greatly to the charm of the scenery, and forms a much-appreciated home for wild fowl of divers kinds. Splendidly developed are the greater portion of the beeches, oaks, pines, and other forms of tree life in the pleasure grounds, and the enclosures contiguous thereto; but one of the most noteworthy of the features of Westwick Hall is formed by the plantations of Pinus Pinaster, some of which were planted near the beginning of the eighteenth century. This pine has a wide distribution both in Asia and Europe, and was introduced to this country by Gerard previous to the publication of his "Herball" in 1596. It was rather largely planted in England, both as an ornamental tree and for economic purposes. At Westwick Hall the planting of this conifer was commenced in 1702, and as it was found to thrive the work was continued at varying intervals until the plantations extended over a large area. An account of these was given in the "Transactions" of the Royal Society of Arts, Vol. xxviii., from notes made in 1809, and from this it appears that Mr. J. B. Petre, the father of the then owner, raised over 200,000 trees from seed gathered from trees growing on the estate. With these he planted upwards of 500 acres of land, and through this area he made a drive five miles in length. The situation was then bleak, and the soil sand, covered with heath and resting on a coarse hard gravel or dead yellow sand. Yet the trees grew vigorously, and in the course of seven or eight years had a girth ranging from fifteen to twenty inches. The success achieved in establishing thriving plantations of Pinus Pinaster on land on which previously nothing but the common heath had been found to thrive was considered worthy of recognition, and accordingly the Council of the Royal Society of Arts awarded Mr. Petre their gold medal.

Although there are other features of the estate hardly less interesting than the formation of the plantations of pine under great difficulties, it is necessary to return forthwith to the many objects of interest in the gardens with which we are at the present time most concerned. It would be interesting to linger among the trees and shrubs with which the gardens are furnished, and derive full advantage from the lessons they are so well able to teach, but time had to be economised when visiting Westwick Hall, and now the question of space arises, and the notes have to be restricted far more than one could wish. It must indeed suffice to say that trees and shrubs form a feature at once attractive and interesting, and that they contribute very materially to the manifold attractions of the garden in the several seasons of the year.

Hardy herbaceous plants have long been cultivated with quite exceptional success, and the fame which the gardens have for so long a period enjoyed is largely due to the glorious displays they annually produce, and the magnificent collections of cut flowers they have furnished for the principal exhibitions held in East Anglia. The number of first prizes that have come to

Westwick Hall Gardens for hardy flowers must be large, for it is a rare occurrence to see a collection contributed by them with other than a first prize card attached to it at an exhibition. The principal herbaceous borders are on the west side of the kitchen garden, but without the walls, and otherwise so arranged as to form an essential part of the pleasure grounds. The enclosure is bounded on one side by the kitchen garden wall, and on the other by a high hedge, and is intersected by a broad walk. The illustration of the border that is given herewith will sufficiently indicate the splendid development to which the occupants of the border attain during their respective seasons of flowering. About one-half of the border on the west side of the walk is shown in the illustration, and with reference to the other half, and the whole of the east border, it must be said that they were in the summer, when the photographs were taken, fully equal to the portion illustrated. In the planting of these borders none but the finest kinds were given a place, and they consequently are excellent examples of selection, as well as cultivation. Mr. Davison has been successful in improving some of the types, and he has succeeded in raising an extremely fine form of Erigeron speciosum, which has received the varietal designation of Quakeress.

SWEET PEA WALK WITH MARGINS OF POPPIES, SHOTESHAM PARK.

The walk that divides the herbaceous borders takes a sharp turn to the right a little farther on, and the right-hand border beyond affords suitable quarters for shade-loving plants. Here the wall is draped with the elegant-growing and brilliantly-coloured Tropæolum speciosum, which grows so freely and blooms so profusely as to suggest that the conditions at Westwick Hall are not less favourable for its development than are those which obtain in the Scottish Highlands. In the border, at the foot of the north wall, is the finest colony of Orchis foliosa that has a place in British gardens, but as it was described and illustrated in these pages early in the autumn of last year, further reference is unnecessary. It is now a matter of common knowledge that for some years past Mr. Davison has devoted a large share of his attention to the improvement of montbretias, and that as the result of his labours cultivators have now at their command a new and remarkably fine race of these beautiful flowers, of which Prometheus is one of the most noteworthy of those in commerce.

Immensely attractive is the pergola devoted to rambling roses, for the selection was judiciously made, and the whole of the plants are in the rudest health. A portion on which the Himalayan briar is running is herewith illustrated, but several other roses were not less remarkable for flower production, especially noteworthy being the specimen of Paul's Carmine Pillar, which annually produces a display that is dazzling in its brilliancy.

Of the orchard and kitchen garden it must be said that they are in keeping with other departments, and that no better proof could be desired of the success with which fruit growing is carried on than the collection of apples with which premier honours were obtained by Mr. Davison at the Norwich Chrysanthemum Show in November last.

Shotesham Park.

Shotesham Park, the residence of R. Fellowes, Esq., is situate some six or seven miles south of Norwich, and in the journey there by road the visitor passes through some of the most beautiful scenery in the eastern counties. The rolling meadows and woodlands which is passed through when the suburbs of the city are left well behind will perhaps appeal the most strongly to many visitors, and certainly the series of delightful pictures they form are such as to attract and hold the attention; but we were perhaps the most interested in that portion of the great Ipswich road that may be included within the suburban area. From within a short distance of the city boundary to a couple of miles or so beyond the road is flanked by residences of varying sizes, and surrounded by gardens remarkable for the taste with which they were designed and planted, and for the excellent condition in which they are maintained. To us this part of the route was of special interest for the evidence obtained of the great love for horticulture that exists among the well-to-do section of the residents within and near the city.

The mansion, which occupies a commanding position in the spacious park, was built about 1758, and is of handsome elevation. Standing amid sylvan charms of unrivalled beauty it has for its setting a broad expanse of closely-shaven lawn, unbroken by flower beds, or so few in number that they escape attention. The enclosure on the side from which the mansion is entered contains several large cedars of Lebanon that were probably planted when the house was built, and have since been allowed to grow without restriction. From the south side the pleasure grounds extend for a long distance, and herein are numbers of coniferous and deciduous trees that are quite unique in their development, as, for example, the magnificent weeping ash illustrated and the finely developed example of Wellingtonia gigantea which occupies a conspicuous position in the illustration of sweet peas, which are here grown with quite exceptional success. The beeches and cedars are particularly fine, as also are the lilacs, Portugal laurel, and other deciduous and evergreen shrubs.

Sweet peas are very highly esteemed at Shotesham Park, and in consequence they are grown extensively. The broad walk that intersects the main walk through the kitchen garden has on each side during the summer months a row of these fragrant flowers set back four or five feet from the box edging, and while yielding abundant supplies of flowers for indoor decorations, they form a screen to the quarters devoted to vegetables. Outside the kitchen garden is the sweet pea walk herewith illustrated. This walk is 164 yards in length, and the sweet peas were arranged in clumps about four feet apart, and the plants were fully eight feet high. The flowers were being produced in great abundance, and, as will be gathered from the statement that in many instances the stalks were twenty inches long and four blooms on a stalk, they were of high quality.

Proceeding at right angles from the far end of the walk illustrated was another long border of sweet peas, also in excellent condition. This border was to the right of the walk, and to the left is a border containing many plants of much interest. Among other things is a large [illegible] of hardy orchids, which are evidently [illegible] at home, and enjoying the conditions [illegible] essential to full development, and [illegible] edging there is a broad band of Gentiana acaulis, which has a length of eighty yards, and must present an extremely [illegible] appearance when in bloom. Running [illegible] over the wall at the back of the border is the brilliantly-coloured flame flower (Tropæolum speciosum), which here, as in some other Norfolk gardens, grows with great vigour.

A west border, within the kitchen garden, is devoted to bulbous iris and other spring-flowering bulbs, and not far distant are the beds of carnations, which form an attractive feature and produce an abundance of bloom for decorative purposes in a cut state. The beds contain about 800 plants, in some 50 varieties, and are of interest for the information they convey regarding the relative merits of the border varieties now in cultivation.

The plant and fruit houses are numerous, and while all the houses contain much to interest visitors, those devoted to the fine collection of orchids are the most interesting. The collection is particularly rich in the finer forms of lælio-cattleyas and cypripediums, while other kinds are freely represented, and there are large numbers of seedlings in various stages of growth. In the collection are many large, finely-developed specimens, and with some of these Mr. L. Smith, the able head gardener, obtained several premier awards in a particularly close competition at the Norwich show in November last. In the stove a remarkably fine form of Gloriosa superba at once attracted attention. and on inquiry being made with regard to its place of origin, it was ascertained that it had been brought from Ceylon some years ago by a member of the family.

Fruit culture under glass is carried out on a large scale, and with much success. In the four big vineries were crops of Muscat of Alexandria, Black Hamburgh, Alicante, and Gros Colmar—grapes that proved to demonstration Mr. Smith's skill as a grape grower. In one of the peach houses we were interested in a tree of Bellegarde peach, which occupies a space of 28 feet by 17 feet, and was carrying a crop of 700 fruits.

Hardy herbaceous plants are grown extensively and well, and roses are cultivated with much success. Especially noteworthy were the fine arches of Lady Gay, Alberic Barbier, Dorothy Perkins, and Crimson Rambler, the last-named being remarkable for its depth of colour. Of much interest was the well-flowered specimen of a variety of the Damask rose that has been grown at Shotesham Park for upwards of 100 years.

George Gordon.

⁂ The second of the two articles on "Some Norwich Gardens" will appear in our next issue (April 18). The gardens will comprise those of Ashwellthorpe Hall, Boyland Hall, Crown Point, Dunston Hall, Oakland House, and Town Close House.

Good Supports for Sweet Peas.—Good supports for sweet peas grown in clumps, or wide hedges, are the young larch trees thinned out from new plantations, where they have been used as nurses. If they can be procured from 8ft. to 10ft. high, they will answer admirably, and should be fixed into position by letting them in the ground eighteen inches to two feet before planting the peas, retaining as many as possible of the lower branches. For clumps they should be fixed 6ft. to 8ft. apart, afterwards planting the sweet peas from pots, using three pots, six to eight plants in a pot, to form a clump. The plants will need an occasional training to get them regularly over the "trees" or supports. It is essential that the trees should be fresh, I mean trees cut this last winter, as peas will not cling properly to old wood. The wind will not blow the peas out of the supports if fresh trees are used. — H. Prentice, Hartpury House Gardens, Gloucester.

BEAUTIFUL FLOWERING TREES AND SHRUBS.

The lecture given by Mr. George Gordon, V.M.H., at the meeting of the Royal Horticultural Society, Vincent Square, on Tuesday, March 17, came at a most opportune time, and, judging by the crowded audience and the close attention paid to all the lecturer said, it is evident more interest is being taken in these interesting and beautiful subjects. Intending planters would do well to make notes from time to time during the coming season of the various species and varieties. As there is now such a wealth of beautiful subjects suited for both large and small gardens alike, which will thrive and flourish in almost any soil, and all parts of the country.

A MAGNIFICENT SPECIMEN OF THE WEEPING ASH, SHOTESHAM PARK.

And, as Mr. Gordon pointed out, these can be purchased for practically the same cost as the most common subjects.

It is painful indeed to see valuable sites in very many of our best gardens occupied by the most common of shrubs and trees, where the more beautiful and rare would succeed, and give so much variety and pleasure. For some reason or another the shrubbery is the last to receive attention in the garden, the result being, however well and carefully it may have been planted, in a few years it becomes an entangled mass. The better things become crowded out, and give place to the coarser kind, such as laurel, yew, privet, box, and the like, and even these, all beautiful in their way when well treated, are poor, miserable specimens when much crowded. These are all excellent when planted judiciously and kept within bounds, both for appearance and affording shelter, but they ought not to be allowed to encroach and spoil the more choice and less rampant growers.

One could hardly credit the large number of varieties and species there are unless pains be taken to visit some of our best formed collections in various parts of the country, at different seasons of the year, Kew, of course, being extremely rich in these, and always properly named. There is scarcely a day in the whole year but some one or another is not in flower. And very many which are not thought to be sufficiently hardy for planting in the open can be safely relied on if suitable sheltered places are selected, and a small amount of protection afforded them in very severe weather.

Unfortunately, very few young men of the present day realise the importance of studying this branch of gardening, and very many, when they attain to an important position as head gardeners, are sadly deficient in all that relates to trees and shrubs. And yet I am convinced in the near future this branch of gardening will occupy a much more prominent position than it does at the present day. The natural requirement of the various subjects must be considered, both as to position, soil, and pruning. And one of the most important points to observe is to avoid overcrowding. Plant thick and thin early is an old adage, and perfectly true; the transplanting and re-arranging of the shrubberies, especially in their early stages, is both practical and extremely interesting, and leaves a mark on the garden for many years. I trust the good advice given by Mr. Gordon will be taken up, not only by many who had the pleasure of listening to him, but many others in various parts of the country.

Edwin Beckett, V.M.H.

THE BEST DAHLIAS.

As our annual exhibition is always held early in September, it is very important for its complete success that during the growing period of the dahlia the weather should be at all events moderately warm and wet. Last year, it need scarcely be said, the conditions were the reverse of favourable, for throughout the whole of the summer the temperature remained low and the rainfall deficient. The National Dahlia Society's show in 1907, which took place on September 5, although, as usual, a very interesting and attractive one, proved less extensive than usual. Mr. E. Mawley, in his "Dahlia Analysis," published in the schedule of the National Dahlia Society, says it will be at once seen by a glance down the short statement given below that the number of shows and fancies was even smaller than in any of the four previous years, except 1906. The pompons were, however, well represented, and also the singles. But in the cactus section, which is always the most popular and attractive in the show, there was a great falling off, as compared with the display of these beautiful flowers we expect to see at an exhibition of average extent.

	1903	1904	1905	1906	1907
Cactus, No. of bunches ...	344	351	369	362	296
Cactus, shown singly	660	708	606	744	624
Shows, No. of blooms	527	512	533	337	478
Fancies, No. of blooms......	181	225	235	161	181
Pompons, No. of bunches	192	155	189	163	210
Singles, No. of bunches...	156	90	93	145	147

Cactus Dahlias.

In the following lists all the best varieties will be found arranged according to the average number of times they were staged at the society's last two exhibitions.

1, J. B. Riding, 1905; 1, J. H. Jackson, 1902; 3, Pearl, 1905; 4, Mrs. Edward Mawley, 1902; 5, Florence M. Stredwick, 1904; 6, Nelson, 1906; 7, Rainbow, 1904; 8, Harbour Light, 1905; 9, Crepuscule, 1905; 10, Mrs. Macmillan, 1906; 11, H. F. Robertson, 1903; 12, Conrad, 1904; 13, Thomas Parkin, 1905; 13, William Marshall, 1906; 15, H. W. Sillem, 1904; 16, Fairy, 1905; 16, Mrs. F. Grinsted, 1906; 18, George Gordon, 1904; 19, Phineas, 1903; 20, Cockatoo, 1905; 21, Ianthe, 1903; 21, Sirius, 1904; 23, Mrs. H. L. Brousson, 1904; 24, H. Shoesmith, 1906; 25, Ella Kræmar, 1905; 25, Victorian, 1906; 27, J. W. Wilkinson, 1901; 28, White Lady, 1906; 29, Ivanhoe, 1906; 30, Mrs. J. J. Crowe, 1900; 31, Alight, 1906; 31, Mrs. S. Gaskill, 1906; 33, Alexander, 1905; 33, Faunus, 1906; 33, Kathleen Bryant, 1907; 33, Mrs. George Stevenson, 1906; 33, Mrs. Winstanley, 1902; 33, Raymond Parks, 1903; 33, Ruby Grinsted, 1907; 40, Mrs. Carter Page, 1900; 40, The Pilot, 1906; 42, H. J. Jones, 1903; 42, Lady C. Campbell, 1904; 42, Mrs. W. H. Raby, 1907; 45, Star, 1906; 46, Antelope, 1905; 46, Lustre, 1907; 46, W. E. Dickson, 1905; 49, Violetta, 1904; 50, Flag of Truce, 1907; 50, Iris, 1906; 50, Primrose, 1906; 50, Premier, 1904.

Now that this section appears to be quieting down a little, it has been thought that better and more comparable results would be obtained by adopting a two years' average, instead of arranging the varieties according to their records at the last exhibition of the society alone. In comparing the positions of certain sorts with the places they occupied last year, it must be borne in mind that a special analysis on the same two years' plan has been drawn up for this purpose, and that these comparisons have no reference to the one year's analysis of 1906.

J. B. Riding and J. H. Jackson now share the premier position in the list, the former having risen since last year from No. 6 and J. H. Jackson from No. 2. Pearl still remains at No. 3, and Florence M. Stredwick at No. 5. Mrs. Edward Mawley has, on the other hand, fallen from No. 1 to No. 4. So that we have here among the first five varieties, what may be regarded from the ordinary amateur exhibitors' point of view, the best dark cactus dahlia, the best white, and the best yellow, which only shows how greatly first-class self-coloured sorts are required in these three colours. In the shaded varieties we have in a variety of tints the perfection of form now looked for in an exhibition cactus dahlia, but not so as yet it would seem in the self-coloured kinds. So that it is pretty certain in the near future that the varieties referred to will be superseded by superior kinds in the same colours.

The most noteworthy changes since last year have been as follows: Nelson has risen from No. 11 to No. 6, Harbour Light from No. 16 to No. 8, Crepuscule from No. 14 to No. 9, Mrs. Macmillan from No. 18 to No. 10; Thomas Parkin from No. 19 to No. 13, William Marshall from No. 23 to No. 13, Fairy from No. 28 to No. 16, Mrs. F. Grinsted from No. 21 to No. 16, H. Shoesmith from No. 43 to No. 24, Ella Kræmar from No. 31 to No. 25, and White Lady from No. 39 to No. 28. On the other hand Rainbow has fallen from No. 4 to No. 7, H. F. Robertson from No. 9 to No. 11, Conrad from No. 8 to No. 12, George Gordon from No. 10 to No. 18, Phineas from No. 12 to No. 19, and Ianthe from No. 7 to No. 21.

Of the older varieties—for so they may be regarded in this progressive section—Phineas, sent out in 1903, falls from No. 12 to No. 19, Ianthe of the same year from No. 7 to No. 21, and H. J. Jones from No. 15 to No. 42, while Raymond Parks remains in its previous place at No. 33. Two of the 1902 sorts still hold splendid positions (I refer to J. H. Jackson at No. 1 and Mrs. Edward Mawley at No. 4), while the remaining variety, Mrs. Winstanley, descends from No. 22 to No. 33. There is only one representative of 1901 on the list, J. W. Wilkinson, the hero of a hundred fights, which has fallen from No. 13 to No. 27. The two oldest cactus dahlias in the analysis are Mrs. J. J. Crowe and Mrs. Carter Page, the former having fallen from No. 24 to No. 30, and the latter from No. 35 to No. 40. Both of these varieties were sent out in 1900.

Show Dahlias.

It should be explained that in the following lists the positions of the shows and fancies are dependent on the average number of times each variety was staged at the last eight exhibitions of the National Dahlia Society, in all instances where their records will allow of this being done. In the case of the small number of newer sorts, their average records for a necessarily shorter number of years have been utilised.

The show dahlias, arranged according to their respective records, came out as follows: 1, R. T. Rawlings; 2, Mrs. Gladstone; 3, John Walker; 4, Duchess of York; 5, Arthur Rawlings; 6, William Rawlings; 7, Florence Tranter; 8, William Powell; 9, Mrs. Langtry; 10, Chieftain; 11, J. T. West; 12, Shotesham Hero; 13, T. J. Saltmarsh; 14, Colonist; 14, James Cocker; 16, Dr. Keynes; 17, Harry Keith; 18, Miss Cannell; 19, Gracchus; 20, Duke of Fife; 20, Mrs. W. Slack; 22, Perfection; 23, Maud Fellowes; 24, Goldfinder; 25, George Rawlings; 26, Prince of Denmark; 27, Mrs. D. Saunders; 28, David Johnson; 29, John Hickling; 30, Shirley Hibberd; 31, Daniel Cornish; 32, Victor; 33, Harrison Weir; 33, Henry Walton; 35, Virginale; 36, Ethel Britton; 37, Marjorie; 38, Henry Clark; 39, Willie Garratt; 40, Diadem; 41, Hon. Mrs. P. Wyndham; 42, Majestic; 43, Warrior; 44, John Standish; 45, Mabel Stanton; 46, Norma; 47, Earl of Ravensworth.

The first six varieties on the list occupy precisely the same positions as in the previous analysis. R. T. Rawlings still takes the lead, followed closely by Mrs. Gladstone and John Walker. In fact, there are no other sorts which can compete with them as reliable exhibition show dahlias, the only other kinds with average records of twenty or more being Duchess of York and Arthur Rawlings. Of the comparatively new dahlias in this section Gracchus, sent out in 1901 (No. 19), has risen four places: while Henry Clark, distributed in 1903 (No. 38), remains virtually at the same position as in the last analysis.

Fancy Dahlias.

The fancy dahlias arrange themselves in the following order: 1, Rev. J. B. M. Camm; 2, Mrs. Saunders; 3, Mrs. John Downie; 4, Emin Pasha; 5, Matthew Campbell; 6, Duchess of Albany; 7, Mabel; 8, Dorothy; 9, S. Mortimer; 10, T. W. Girdlestone; 11, Frank Pearce; 12, Goldsmith; 13, Dandy; 13, Watchman; 15, Buffalo Bill; 15, Peacock; 17, Prince Henry; 18, Rebecca; 19, Sunset; 20, Comte de la Saux; 21, Distinction.

They as a rule occupy practically the same places as in the analysis issued last year. Mabel, an 1897 variety, has still further improved the position it gained last year by rising from No. 9 to No. 7. Emin Pasha has also risen from No. 6 to No. 4, Frank Pearce from No. 14 to No. 11, and Dandy from No. 15 to No. 13.

New shows and fancies appear from time to time, but few secure sufficient popularity with exhibitors to displace their older brethren, some of which, like James Cocker, date back as far as 1871, Mrs. Saunders as far back as 1872, while James Walton and Rev. J. B. M. Camm were sent out in 1873.

Pompon Dahlias.

I append a list of varieties arranged according to their average records at the last four exhibitions of the society, in all cases where this is practicable. Those kinds which at the time of the last show of the National Dahlia Society were three or fewer years old are indicated by an asterisk.

1, Bacchus; 1, Nerissa; 3, Tommy Keith; 4, Darkest of All; 5, Douglas; 6, Emily Hopper; 7, Adelaide; 8, Jessica; 9, Daisy; 10, Ganymede; 10, Nellie Broomhead; 12, Little Bugler; 12, Rosebud; 14, Ideal*; 14, Queen of Whites*; 16, Dr. Jim; 16, Violet; 18, San Toy*; 19, Little Mary*; 20, Cyril; 20, Ernest Harper; 22, Edith Bryant; 22, Midget*; 22, Phœbe; 22, Sunny Daybreak.

The changes also in this section are mostly very slight. Little Bugler has, however, risen seven places since last year. On the other hand Dr. Jim has lost three places, and Cyril and Ernest Harper six places. Of the pompons sent out in 1904 Queen of Whites remains as before, while San Toy has gained one place. Ideal, distributed in 1905, on its first appearance secures a position at No. 14, while Little Mary has risen two places. The only 1906 Pompon on the list, Midget, will be found at No. 22.

Single Dahlias.

Arranged according to their average records for the last three exhibitions, the leading varieties come out as follows: 1, Leslie Seale; 2, Mikado*; 3, Stromboli*; 4, Mavourneen*; 5, Royal Sovereign; 6, Eclipse*; 6, Liberty*; 8, Princess of Wales; 8, William Parrott; 10, Victoria; 11, Beauty's Eye; 11, Darkness; 11, Formosa; 11, General Kuroki*; 11, Miss Roberts; 11, Snowdrop; 11, Veronique*; 18, Polly Eccles. The varieties marked with an asterisk are new sorts—those sent out in 1905 or subsequently.

The changes in the singles, for many years almost as conservative a race as the shows and fancies, display considerably vitality in this section, and are therefore to be welcomed. Care must, however, be taken that in the desire for novelty some of the best of the older varieties are not displaced by kinds which do not comply as completely with the characteristics given as a guide for the raisers at page 81 of our "Official Catalogue," viz., "Flowers perfectly circular, consisting of a single ring of eight florets surrounding the central yellow disc, the florets broad and flat, overlapping each other, rounded and slightly recurving at the tips."

Leslie Seale deservedly heads the list, as there are few other varieties which have as many good qualities. Among other changes in the established varieties the following may be noted. Victoria has gained three places, Beauty's Eye five places, and Miss Roberts two places. On the other hand, William Parrott has fallen four places, Darkness six places, Formosa three places, Snowdrop two places, and Polly Eccles eight places; while that perfect model of what a single dahlia should be as regards form, Columbine, which was last year at No. 10, has now disappeared altogether from the list.

THE RAMONDIA IN THE GARDEN.

There are many who think that the ramondia is a modern garden plant, but it must be remembered that the one which is best known in our gardens, Ramondia pyrenaica, was cultivated in this country very long ago. It certainly was grown by Miller in 1731, and most probably by Parkinson, who figured and described it in his "Paradisus." An excellent plate of this species also appeared in the "Botanical Magazine," Vol. III., 1794 (t. 236), which is before me as I write, and is a wonderfully good representation of the species, which was then known as Verbascum Myconi, or the borage-leaved mullein. It is thus difficult to account for its comparative scarcity in gardens until within the last few years, except it was due to the lack of appreciation of hardy flowers caused by the craze for bedding being carried to undue length.

Nowadays, however, the ramondias are appreciated in all good gardens where rock plants are cultivated, and where the few requirements can be complied with, while the introduction of R. serbica Nathaliæ has caused them to receive more notice than for some time. As rock garden plants all of these are of great importance.

Their Proper Position.

It is thus desirable that the requirements of these good rosette mulleins should be studied, so that there may be as few failures with them as possible, and a long experience and observation enables one to say with confidence that there is not any good reason why almost any garden may not become a happy home for them.

In the first place, it may be said that they are shade lovers, and that nothing is more detrimental to them than planting them in sunny places, where their foliage soon shrivels up, and the plant falls a victim to the want of knowledge or of thought which condemns a denizen of the shady ravines of the high mountains to the arid and sunny rockeries on which we have seen them planted. This remark is not a whit too severe; and the ramondia will soon vanish in such a situation, unless shielded from the sun by some contrivance, such as a large stone by which it is screened from the solar rays, or some shading material placed over it during the summer months. But such arrangements are really unnecessary, and are only alleviations of an evil which should never have existed.

It is an easy matter to so arrange a rockery or rock garden, or even a little bit of rough walling, that the ramondias may luxuriate in the shade they love. Nowhere can they be better grown than on a wall facing north, especially if it supports a bank of soil, so that the plants may derive plenty of moisture from behind. Such a wall, with only a slight "batter," or lean inwards, is an ideal home for these flowers. On a rockery, with almost perpendicular rocks, facing north, they will also flourish if well planted between the crevices, and with stones jammed close about them to keep them firm. Even on a low bank of soil facing north they will do well, and the late Rev. C. Wolley Dod, in his famous garden at Edge Hall, in Cheshire, had a colony of healthy plants in such a position, but screened from the sun from behind by a low fence of iron. This was more artificial than one would choose, but it served its purpose, and the plants it shaded were in perfect health.

Given conditions such as these, with moisture at the roots and shelter from the sun, the ramondias will thrive, but they are wonderfully accommodating if shelter from sun is secured. At Trinity College Botanic Gardens there used to be a colony of seedlings on a dryish, but shaded wall, apparently self-sown from some other plants there. The wall was an ordinary built one, and the seedlings had only what nutriment was in the joints of the stones and what they derived from the air to sustain them. There are nurseries and private gardens where there are hundreds of these ramondias established in rough walls with earth behind, and where, in their flowering time, they present a fine sight indeed.

How to Raise the Ramondias.

A stock of ramondias can be raised from seeds sown in fine soil composed of loam, leaf-soil, and sharp sand, the surface being made level and the seeds sown and just covered on the top with some of the finest of the earth. They should always be sown in well-drained pots, and the latter placed under glass, with a sheet of glass covered with brown paper over them. When the seedlings appear the glass and paper should be removed and air given. When the seedlings are large enough to handle they must be pricked out an inch apart, and planted out when of fair size. I prefer planting them out in spring, as then they are not so liable to be forced out by frost.

Soil.

Soil presents little difficulty, as the ramondias are accommodating in their needs regarding this. Loam, leaf-soil, or peat, and sand make an excellent compost, but it should be made firm, and the plants, which have short roots when young, fixed firmly into the soil by pieces of stone. None of the ramondias, except R. serbica Nathaliæ, object to lime.

Species and Varieties.

R. pyrenaica, the best known, is a pretty plant, with its rough and wrinkled leaves, and its bluish-purple flowers on stems not more than six inches high. There is a very beautiful white variety, and some seedlings from this show considerable variety in tone of white. A rose-coloured variety is in existence, but is scarce and expensive.

R. serbica is a charming ramondia, with pale blue or mauve flowers, and rather dwarfer in its growth, while its variety Nathaliæ has its flowers of a darker colour, and its anthers of a bright orange. Some plants, not yet well known, have been introduced, as R. quercifolia, R. leucantha, and R. peregrina, and these appear to be varieties only of R. pyrenaica. These thrive with me under the same conditions as the others.

It will be seen from these notes, which, lengthy as they are, do not exhaust all that could be said about these lovely rock plants, that the genus Ramondia is one worthy of the appreciation of the admirer and student of the flora of the mountains of Europe, with all its variety, interest, and charm. S. ARNOTT.

Azalea mollis after Flowering.—Mollis azaleas all too rarely bloom so freely after their first season in England as one would like; in fact, many of them never bloom at all. Beginners in their culture are told that the plants are hardy, and consequently think they may be turned out of the house as soon as they become shabby. But hardy plants under glass for the nonce become tender plants, and should be always treated as such. Thus, mollis azaleas, instead of being turned out after flowering, should go into a warmer corner, either of the greenhouse or vinery, where they can be well looked after until they have quite finished making their new growth.—E. J. K.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

CYPRIPEDIUMS.—The summer-flowering kinds of cypripediums will now be producing their flower scapes, and will need careful attention and the necessary encouragement to induce them to expand their flowers in a satisfactory manner. C. Lawrenceanum, in its varied dark forms, is one of the most useful we have among the tessellated foliage section for cut flower purposes, as with their great length of stem the flowers can be readily arranged with other flowers. I regard this and C. barbatum as two of the most serviceable of the cypripediums for the supply of cut flowers, as their lasting qualities leave nothing to be desired. C. Lawrenceanum Hyeanum, the albino of the species, which for many years was scarce and valuable, has now become plentiful in collections. It is supposed to have a delicate constitution, but I find when grown in a temperature about 65 degrees normal through the year it is even less difficult to grow than the typical forms. Its allied albino, C. callosum Sanderæ, is one of the most vigorous growers, and is free in flowering, and one of the most beautiful of the cypripediums. It can now be purchased at practically the same rate as the typical coloured varieties, and should have a place in every collection. The whole of these should be placed in a position where they can obtain the full benefit of light, and be shaded only when there is a danger of the foliage becoming discoloured or scorched. Spraying overhead is beneficial at this season, as it assists in keeping insect pests in check.

Where thrips make their appearance among these cypripediums they are extremely difficult to dislodge. I would, therefore, advise that the plants be sprayed overhead at regular intervals with some safe insecticide. Select a bright day for the purpose, and spray between nine and ten a.m. This will give ample time for the leaves to become dry before night. Shade carefully after spraying. Where thrips have become established on any plants the only possible way of banishing these pests is to persevere with frequent dippings. I would advise dipping such plants twice a week for at least a month, then weekly for an equal period, and so on until satisfied that the pests have been wholly destroyed. We have made a practice for some years past of spraying the plants in all the divisions of our orchid houses fortnightly during the summer months, and find it a good remedy for keeping insects in check.

In dealing with the summer-flowering cypripediums, where they are grown as large specimens for exhibition purposes, I would point out that considerable advantage may be obtained in the production of colour if the plants are grown for a few weeks previously to their flowers becoming expanded under cooler conditions, as, for an example, in an intermediate house, where the temperature is maintained at about 55 degrees at night. C. Lawrenceanum is much benefited thereby, while the substance and colour of the flowers of C. Curtisi are greatly improved. The potting requirements of this class are best attended to after the flowering season is past. I hope to refer to this matter again at the proper season.—H. J. CHAPMAN, Oakwood Gardens, Wylam-on-Tyne.

STOVE PLANTS.

MEDINILLAS. — The remarkably handsome foliage and flowers of these free-growing stove shrubs command the attention of everyone under whose notice they come. The flowers appear in graceful, drooping panicles, and produce a charming effect. It is essential that the medinillas should be placed in a light position, and be allowed sufficient space to admit of the natural development of growth. They are undoubtedly the most attractive when grown as large specimens. Cuttings root freely at this season of the year, or as soon as the growths have attained about three inches in length. They should be removed with a heel, put singly into small 60's filled with a sandy compost, and the pots plunged in a brisk bottom heat. Established plants require plenty of root room during their early stages of growth, and attention must be given to the specimens. As the pots become filled with roots give liberal applications of weak liquid manure, with an occasional top-dressing of some approved artificial fertiliser. Medinillas succeed best in a porous compost of lumpy fibrous loam and peat, with charcoal, lime rubble, and a sprinkling of well-decayed sheep manure thoroughly incorporated. Pot very firmly.

MARANTAS.—Where fine foliage plants are appreciated marantas will prove useful and interesting. They afford a great diversity both in the markings of the leaves and the sizes to which they attain. Experience has proved to me that these plants succeed best when propagated by division of the roots at the time when the plants show signs of making new growth. They succeed best in the intermediate stove, shaded from the hot sun, and given a moderately moist atmosphere, otherwise the beautiful velvety appearance of the foliage is not so evident. During their growing season the free use of the syringe is necessary.

CLIMBERS.—Attention should be given to climbing plants by training the shoots into the desired position, and the thinning out of weak undesirable growths. Climbers ought not to be allowed to ramble at will, or they will eventually prove detrimental to the other occupants of the stove.

CROTONS.—Those who desire to secure highly-coloured examples for exhibition or other purposes must be careful to expose them to full sunlight, and to grow them as near the glass as is possible without injury to the foliage. They colour much more freely when the pots are well filled with roots and regular attention given by way of feeding with chemical fertilisers.

REARRANGEMENT of the plants in the stove from time to time always proves interesting, and is sure to be appreciated. In carrying out this work remove any unsightly plants into a less conspicuous position.

SHADING.—Blinds ought to be fixed in their position ready for use when required. I have found the Parisian lath blinds admirably adapted for shading of stove plants. The Japanese split bamboo blinds are less expensive, and are readily adapted for fixing into position.—John Donoghue, Bardon Hill Gardens.

FRUITS UNDER GLASS.

MELONS.—These will now be growing freely, and, owing to the sunless weather, a liberal amount of fire-heat will be necessary. If bottom heat is derived from the hot-water apparatus, watering must have close attention, as the roots of these soon penetrate to where it is warm, and if sudden bursts of sunshine occur when the roots are dry the plants will suffer, and red spider put in an appearance. If a few early fruits are required the leading shoots may be stopped before they reach the top of the trellis. Side shoots will soon be produced, and if these have the point nipped out at the first leaf the next shoot should throw fruit. As soon as the fruits are set the bed may be top-dressed occasionally, as appears necessary, with some good loam. The plants will take an abundance of water providing the drainage is in good condition. To keep up a succession for a full supply much room is required, and another sowing should be made. Seeds will germinate more quickly and better now than earlier in the year, and, as in the case of the previous crop, they should be sown in three-inch pots.

COOL ORCHARD HOUSE.—Trees have come on very steadily and satisfactorily, plenty of bloom was produced, and all the trees have set their fruit well. Cherries should, as soon as the fruits are set and the leaves are unfolding, have a fumigation for a night or two, as black fly is very troublesome if it becomes established. The fruits may be thinned, a few being taken off at each thinning. Plums should also have close attention. If they are making very strong growth a few extra may be left on, and may be thinned out later and used for culinary purposes. Pears and apples should be left still longer before thinning, as they generally throw off a good few as growth proceeds. When all can be seen swelling off the pots may be plunged, if not previously done. The bed where they are plunged should be well drained, and there is nothing better than a bed with chalk bottom, with drains to take away superfluous water. If the weather keeps dull and cold syringing must be judiciously done. Avoid cold draughts in ventilating the house. Figs also planted in a cool house such as this are very useful, as the fruit is available just before the outside crop is ripening. They may be planted out or be grown in pots, but pot trees are preferable as they can be moved about when required.

LATE VINERIES.—By this date vines in the late houses will be making new growths, and must be treated accordingly. Having a good season of rest, they should break strong, and in disbudding select the lower shoot on the spur to be left, providing it is strong, and in a good position to tie down. Water the inside border if necessary. If the roots are in an outside border these should be seen to. If they have been covered up with old garden lights, as previously advised, these may be removed.—A. B. Wadds, Paddockhurst Gardens.

THE KITCHEN GARDEN.

TOMATOES.—Plants raised from seeds that were sown last month for furnishing the crops out of doors will now require attention as regards keeping them near the glass. Shift them on from the three-inch pots into others one size larger, using a compost of turfy loam and a little wood ashes. With this method good strong plants can be had for planting out at the latter end of May. Those plants raised from autumn-sown seeds, and grown on, will now be giving a few ripe fruits, which will be much appreciated. Continue to give them a little stimulant, such as bone meal, to assist the other fruits to swell freely. The successional crops will now want a little top-dressing of loam and some approved artificial manure, giving them plenty of water whenever they seem at all dry.

CARROTS.—The seeds of main crop varieties should be sown without delay, and if the soil be light, and of a good depth, so much the better for the crop. Very good results can be obtained from heavy land, provided the soil is trenched to a good depth. Afterwards make holes with a bar, and fill them up with fine soil, then sow two or three seeds in each hole. The rows should be from twelve to fifteen inches apart, and about the same distance from each hole. But on all suitable soils the lines should be drawn at twelve inches apart, so that a Dutch hoe may be worked between the rows with ease. Young carrots are always in demand, and seeds of Early Nantes should be sown at short intervals throughout the season to keep up a regular supply.

POTATOES.—The planting of the main crop varieties should be pushed on without delay, but choose dry weather if possible. Wood ashes and London manure forms a useful fertiliser, and improves the quality of the crop. Plenty of room should be given between the sets, and in the rows, to ensure strong, firm growth. The Factor, Scotch Triumph, and Up-to-Date do well on our heavy land, and yield good crops.

PARSLEY.—Another sowing of parsley should now be made, so as to keep up a supply during the summer months. This useful herb delights in strong loam, made fairly firm; some prefer to sow in boxes in heat, and when ready transplant it into permanent beds. By this method strong plants are soon obtained.

ONIONS.—Plants that have been pricked off into boxes should be gradually hardened, with a view to their being finally planted in beds about the middle of the present month. When planted out they must be carefully attended to until they become established.

PEAS.—Continue to sow only the best varieties on well-trenched ground, giving them plenty of room between the rows. If the seed can be placed about two inches apart from seed to seed better filled pods will be the result. Allow about the same distance from each row as the height of the peas that are sown.

RED CABBAGE.—Plants raised from seeds sown in the autumn should now be finally planted, selecting the thickest-stemmed ones at the basin, and making them firm as the work proceeds.

LETTUCE.—Plants that were raised from seeds sown early, and pricked off into boxes or frames, will now be ready for planting out on sheltered borders, where protection may be given if necessary. More seeds should be sown for succession.

BEET.—Small sowings of seeds on a warm south border of the turnip-rooted variety will prove most useful for the salad bowl early in the autumn.

CELERY.—The first batch of plants that was pricked off into boxes last month for planting out early should be kept growing without the slightest check, closing the frame early in the afternoons, and damping the plants over through a rose. Plants from seed sown later for the main crop should now be pricked out in a frame, using nice rich soil, and giving them the same treatment as recommended for the above.

SALSAFY AND SCORZONERA.—Seeds of these two vegetables may be sown now in drills, fifteen inches apart, and about one inch deep. It is not often they are wanted in quantity, so therefore a few rows will be sufficient.—T. W. Birkinshaw, Hatley Park, Sandy.

A NOVEL APPLE TREE.

Herewith I send you a photograph of a French Crab apple tree, taken on New Year's Day, 1908. The crop, one bushel, was gathered on the same day, after having withstood severe gales and frosts, and not losing a single fruit. Wind has no effect on it, and it was very hard to separate the stems from the tree on the date named. French Crab is a fine cooking apple from April to June, and as fresh and brisk in the latter month as our best apples are in December.

I note that your correspondent, Mr. H. Markham, on page 227, makes this apple synonymous with Northern Greening, but there is really no comparison between the two. The Messrs. Seabrook and Sons, of Chelmsford, are the only trade firm that I know who bracket these two kinds together.

Straffan.

[We much regret that the photograph sent was not suitable for reproduction. We may point out that French Crab is, according to Dr. Hogg, synonymous with Winter Greening rather than with Northern Greening, although Dr. Hogg himself gives John Apple as a synonym of both Winter Greening and Northern Greening. Winter Greening or French Crab, is notable for the length of time it will keep fresh under suitable conditions. We have seen fruits kept sound for nearly two years, and at the late Mr. Smee's garden at Wallington, Surrey, we have many times seen sound fruits kept well over twelve months.—Ed.]

Raspberry Canes.—Newly-planted canes should be cut down to within a few inches of the ground level, and especially those planted late. If allowed to remain the crop will not be much, and the next year's fruit canes will be weakened. Those varieties intended to fruit in autumn should also be cut down, and in some seasons a very nice crop of fruit can be gathered from them. Keep the ground clean and free from weeds, and mulch well if the land is light and porous.—H. Markham.

DEVON DAFFODIL AND SPRING FLOWER SOCIETY.—FIFTH ANNUAL SHOW will be held at PLYMOUTH GUILDHALL, on TUESDAY and WEDNESDAY, 21st and 22nd April, 1908.
Entries close 15th April.
Tradesmen wishing to exhibit (not for competition) must give at least 10 days' notice.
Schedules, and all information, from CAPTAIN PARLBY, Hon. Sec., Manadon, Crown Hill, S.O., Devon.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five shilllings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Brighton Horticultural Society.

The Brighton Society was fortunate in choosing a very beautiful spring day for the opening of its spring flower show in the famous Dome and Corn Exchange. The sun shone gloriously all day, and, though there was a keen edge on the wind on April 7, the Queen of Watering-places wore a gay and festive look that becomes the spring time.

From Haywards Heath to Brighton the railway banks and the fields gave tokens of spring in the golden stamened flowers of the willows, the innumerable primroses, the coltsfoot, and other early blooms.

A very wide range of subjects is covered by the spring schedule of the Brighton Society, so that the show is an interesting one. Daffodils do not monopolise the attention, but they are provided for, as are hyacinths, azaleas, arums, genistas, orchids, pelargoniums, etc., etc. The exhibition was a good one, and both the Exchange and the Dome were well filled with bright flowers.

GROUPS AND TABLES.

The only exhibitor in the class for a large group of flowering and foliage plants was Mr. E. Jones, gardener to W. H. Young, Esq., Withdean Grange, Brighton, who had masses of forced flowering shrubs, such as prunuses, spiræas, lilacs, wistarias, and Clematis indivisa lobata, with arums, ferns, palms, lily of the valley, and Erica carnea. He was awarded first prize. In the amateurs' division Mr. T. Wells led for a semicircular group with a bold display of daffodils, arums, etc.; Mr. G. Turrell came second; and Mr. J. Martin, Lewes, third. In another class Mr. A. J. Blake was the leading prize-winner, followed by Mr. G. H. Bennett; both showed cytisuses, Azalea mollis, daffodils, and other early flowers.

Mr. J. Backshall was placed first for a mantelpiece and hearth decoration, with a simple design in zonal pelargoniums and dielytras; Mr. H. Goldsmith second with daffodils, cinerarias, cut zonal pelargoniums, and forsythia sprays. In the ladies' class, Miss Mabel Howell led with marguerites and arums; Mr. H. J. Brill, Southdawn Avenue, Brighton, second, with daffodils; Mrs. Garnet third with arums, daffodils, and genista sprays.

Mr. H. Goldsmith was the only exhibitor of a large table of plants, arranged for effect; he used schizanthuses, dielytras, Primula obconica, and carnations, but not very effectively. Mr. F. Collis, gardener to Mrs. Hughes, Boston Park Avenue, Brighton, was awarded first place for a table of plants arranged for effect, and used stellate cinerarias, daffodils, and anthuriums; Mr. G. Chandler was placed second with a pretty table of Celsia arcturus, hyacinths, and cinerarias. Mr. A. J. Blake was the only exhibitor of a table of orchids, and he was worthily awarded first prize for a gay display of Cœlogyne cristata, Dendrobium Wardianum, D. densiflorum, Lælia flava, and some cattleyas.

There were nine florally decorated dinner tables, and the competition was a good one; premier position was allotted to Mrs. H. J. Brill, 78, Southdown Avenue, Brighton, for white daffodils and rose-pink tulips—a pretty combination; Mrs. Rafley, The Lodge, Warblington House, Havant, second, with golden daffodils and croton leaves; Miss Mabel Howell, Tower Lodge, Queen's Park, Brighton, third, with pink begonias and lily of the valley; and Miss Cheesman, Islingwood Road, Brighton, fourth.

PLANTS AND FLOWERS.

In the class for lachenalias, premier place was accorded Mr. G. Mann, gardener to W. Dadney, Esq., East Hill House, Portslade, for six pots of well-grown plants; Mr. E. Jones, gardener to H. Young, Esq., Withdean Grange, Brighton, second; and Mr. F. Collis, gardener to Mrs. Hughes, Preston Park Avenue, Brighton, third. Freesias were well shown, the best six pots of these fragrant flowers coming from Mr. G. Chandler, gardener to S. C. Witting, Esq., Hollingbury Copse, Brighton; Mr. Maskell, gardener to E. Curwen, Esq., Withdean Court, Brighton, second; and Mr. E. Jones third. Spiræas were good, and Mr. E. Jones was a good first for a dozen pots; the Brighton Florists' Company, Western Road, Brighton, coming second with plants not yet fully opened. Polyanthuses made a pretty display, Mr. G. Chandler leading with a dozen pots of large-flowered, richly-coloured forms; Mr. S. A. Holman, Lewes Road, Brighton, second; and Mr. G. H. Bennett, gardener to P. H. Bayer, Esq., Hatch Beauchamp, Withdean, third.

For double primulas, six pots, Mr. G. Chandler was far and away the best exhibitor, staging half a dozen of the finest plants we have seen for a very long time; they were smothered with large double white flowers; Mr. E. Jones second. Mr. A. E. Golding, gardener to H. St. George Voulls, Esq., Uplands, Dyke Road, Brighton, led for six Dielytra spectabilis, showing large specimens; Mr. G. H. Bennett second; and Mr. C. Moffett, gardener to A. Corey, Esq., Downside, Roedean, third. The best cyclamens came from Mr. E. Jones, who had freely-flowered plants of a good strain; Mr. Maskell second; and Mr. G. Chandler third.

In the dome, in front of the platform, the genistas, arums, and azaleas made a very pleasing display. For nine azaleas, Mr. G. Chandler scored with somewhat small but very finely-flowered plants; Mr. E. Jones a good second. Mr. E. Collins showed the best half-dozen azaleas, but these were scarcely yet at their best; Mr. W. Maskell second. The best six pots of arum lilies came from Mr. H. Goldsmith, gardener to Daniel Hack, Esq., J.P., Fir Croft, Withdean, who had big plants carrying splendid spathes; Mr. G. Chandler second. For four pots of arums the honours fell in order to Mr. A. J. Blake and Mr. W. Maskell. The genistas were very bright, and the best dozen pots came from Mr. H. Goldsmith, who was a good first; Mr. E. Jones was second; and Mr. W. Maskell third.

Hyacinths were poor. Mr. A. E. Golding scored for a dozen plants, and Mr. C. Moffett came second. Lily of the valley was also very poorly shown for Brighton; there were three competitors, the Brighton Florists' Stores coming first, Mr. A. E. Golding second, and Mr. E. Jones third. The Brighton Florists' Stores led for half a dozen pots of stocks, showing very good plants; Mr. E. Jones second. Mr. Chandler led for six pots of tulips with a very well grown set; Mr. Bennett second. Mr. E. Jones led for nine and Mr. Bennett for six table plants. In a special class for six pots of tulips, prizes provided by Messrs. Tilley Brothers, Mr. T. Wells was a good first with excellent flowers of Keizer Kroon, etc.; Mr. G. Chandler second; and Mr. H. Goldsmith third; five competitors. For six hyacinths, special prize, Mr. T. Wells was again first with well-grown spikes; Mr. Moffett second.

Mr. J. Martin led for eight varieties of daffodils, with Victoria, Madame Plemp, Golden Spur, Empress, Sir Watkin, Barri conspicuus, and C. J. Backhouse; Mr. M. Tourle, gardener to Captain J. R. Smiley, Horsted Place, Uckfield, second. Mr. E. W. Haywood, gardener to the Right Hon. Lord Denman, Balcombe Place, Sussex, was awarded first prize for twelve kinds of cut flowers; he had the new Queen Alexandra spiræa, fair roses, and good cyclamens and violets; Mr. E. Jones was placed second; he had some good carnations, excellent roses, and good liliums and lilacs. Mr. S. Mortimer, Swiss Nursery, Farnham, led for three vases of carnations with Robert Craig, Enchantress, and Rose Pink Enchantress in fine condition. For a dozen roses, Mr. G. Mann, gardener to W. Dudney, Esq., East Hill House, Portslade, scored with big blooms of Niphetos; Mr. Haywood second.

Mignonette was finely shown. The best six pots came from Mr. A. H. Seall, gardener to Miss Smith, Miramahi, Withdean, but he was disqualified because his pots were more than six inches in diameter. Mr. G. Chandler won first prize; Mr. E. Jones second; and Mr. H. Goldsmith third. The latter led for six amaryllis, and was an excellent first; Mr. E. Jones second. Mr. Chandler showed a fine set of six Chinese primulas, and worthily won first prize; Mr. Moffett second, and Mr. E. Jones third. Mr. J. Martin, Mount Pleasant, Lewes, led for twelve pots of primroses; he had four very poor plants and eight good ones, the latter including some fine blue varieties; Miss Alice Smith, The Bungalow, Barnham, Bognor, second; and Mr. E. Jones third. Auriculas were not especially good; for six pots, Mr. J. C. Reeves, gardener to Captain H. Acton Blake, Pucks Croft, Rusper, led with freely-flowered alpine varieties; Mr. S. A. Holman second; and Mr. A. J. Blake, gardener to Dr. E. J. Tulke-Hart, Totteridge, Dyke Road, Hove, third.

Mr. E. Jones showed the best half dozen show pelargoniums, the best six clematises, and the best six liliums. Mr. J. Backshall, gardener to J. Lawson, Esq., Highlands, Hassocks, was a good first for zonal pelargoniums, showing double and semi-double varieties. Messrs. Sutton and Sons' prizes for cyclamens were won by Mr. E. Jones and Mr. Chandler, with good plants finely flowered. Mr. J. Burstow, Ravenswood, Bulkington Avenue, Worthing, had the best three orchids —Cypripedium insigne, C. villosum, and Sophronitis grandiflora.

In the open class for a dozen cinerarias, Mr. Chandler led with dwarf, large-flowered, broad-headed plants, mostly of a deep purple-blue shade; Mr. F. Collis second; and Mr. E. Jones third. Mr. Jones scored for six hydrangeas with blue-flowered plants that were very effective; Mr. Tourle second with fine dwarf heads. Mr. Chandler scored for a dozen Stellata cinerarias, showing a very pretty set; Mr. G. Bennett second; and Mr. J. C. Reeves, gardener to Captain Acton Blake, Puck's Croft, Rusper, third. Messrs. Sutton and Sons provided the prizes in this class.

Mr. R. J. Blackman, Albion Nursery, Hayward's Heath, won first prize for six pots of forced strawberries, and also for a dish of picked fruits; Mr. E. Jones was second in each case. Mr. G. H. Bennett was placed first for six pots of narcissi, and he had contrived to get a quantity of bulbs into each pot, but his flowers were small, though abundant; Mr. C. Moffett second, with far larger flowers, though his Barri flowers were rather past their best; Mr. A. E. Golding third.

NON-COMPETITIVE.

A handsome group of beautiful carnations was set up by Mr. S. Mortimer, Farnham, Surrey, in which there were big vases of fine blooms of Enchantress, The Belle, Lady Bountiful, Robert Craig, Flamingo, Fair Maid, and Harry Fenn; Mr. Mortimer had also numerous good bunches of All-the-Year-Round stocks. Mr. C. F. Waters, Deanland Nursery, Balcombe, also had a fine exhibit of carnation blooms, his Rose Pink Enchantress, White Perfection, Lady Bountiful, Enchantress, Lady Carlisle, Prosperity, Beacon, and Elliott's Queen being very good.

Messrs. J. Cheal and Son, Lowfield Nursery, Crawley, contributed a collection of alpine plants, making up a pleasing exhibit; the same firm showed cut roses, daffodils, and flowering plants of azaleas. Mr. J. Williams, Oxford Road, Ealing, submitted his rustic table decoration stands, variously filled with seasonable flowers. Miss A. Smith, The Bungalow, Barnham, sent a pretty exhibit of Munstead Polyanthuses, double and single primroses, double daisies, etc.; and Messrs.

W. Meeds and Son, Burgess Hill, had an attractive display of artistic garden pottery.

Messrs. W. Balchin and Sons, Brighton and Hove, again had a fine exhibit; they grouped hyacinths and azaleas under an alcove, and surrounded these with dainty ferns; fine crotons flanked the flowers, and the whole exhibit was embowered in fine palms. Mr. F. Herbert Chapman, Rye, contributed a bright and interesting display of daffodils, his best flowers being those of Virgil, Horace, Weardale Perfection, Duke of Bedford, Golden Bell, King Alfred, and Seagull; the same exhibitor set up a vase of the pretty yellow Freesia Chapmani.

Winter-flowering Carnation Society.

After a very successful exhibition on April 1, at the Royal Horticultural Hall, and a gate of £18 5s., the members of the above society met at seven o'clock at the Hotel Windsor, and dined together, under the presidency of Mr. J. S. Brunton. The tables were prettily decorated with carnations brought over from the show.

After dinner the usual loyal toasts were honoured. Mr. Hawes proposed "The Judges." He referred to the difficulties attending a close competition, and also to the fact that they had been well served that day, for not a single complaint against the judgments recorded had been made. Mr. Wallace, of Eaton Bray, responded to the toast. Mr. J. H. Witty proposed "The Exhibitors," remarking that the judges would be unnecessary if there were no exhibitors. They had seen numerous fine displays at the hall, both competitive and non-competitive. Mr. L. J. Cook (H. Low and Co.) responded.

The Chairman then proposed "The Committee and Officers," and he spoke at some length of the valuable services rendered by Mr. S. Mortimer, who was not only vice-chairman, but was the most successful recruiting member they had. He referred to the enthusiasm of Mr. Hayward Mathias, the hon. secretary, who was a very hard worker, kept the committee well together, and looked carefully after financial matters. He eulogised the services of Mr. E. F. Hawes, who acted as exhibition secretary, and thus lightened the hon. secretary's burden. The auditors, Messrs. A. Dean and C. H. Curtis, received their meed of praise. Mr. Hayward Mathias responded, and expressed his own thanks to those who had rendered so much aid in the management of the show, particularly to Messrs. E. F. Hawes, S. Brookes, and A. Smith, who had relieved him of so many details that he had been able to clear up all accounts that afternoon, including the payment of all prize monies. They were a young society, and last year the membership was 159, now it was 180, and he hoped it would be 200 before they met again. After paying the show expenses of the day, the exhibition had yielded a clear profit of £13 5s. 2d.

Mr. P. Smith, of Medhurst, proposed "The Press," and, like each other speaker, in turn he considered this the most important toast of the evening. He paid a high tribute to the kindness of the horticultural Press in giving the society every possible publicity, and thus making the present flourishing condition of the society possible. Mr. C. H. Curtis (Gardeners' Magazine) responded, and pointed out the proposed registration of new varieties was an excellent idea, but if the society was to live up to its privileges and secure the assistance of the Press, it must go beyond this, and beyond the exhibitions. He urged the compilation of a complete list of winter, or perpetual-flowering carnations, with the names of the raisers or distributors, and also of a list of too-much-alike varieties.

Mr. S. Mortimer proposed "The Chairman," a toast that found ready and enthusiastic acceptance. Mr. Brunton briefly replied.

ANNUAL MEETING.

After a few minutes interval the annual meeting commenced with the reading and passing of the minutes. The balance-sheet was then placed before the members, and, on the motion of Messrs. A. Hemsley and E. F. Hawes, it was adopted. The adoption of the annual report was moved by the Chairman, and seconded by Mr. Mortimer. The Chairman touched upon the chief features of the report, and several members spoke to the motion, chiefly in connection with the expense of a die for a medal, Mr. Pinches eventually undertaking to obtain further particulars as to cost. This discussion was opportune, and it gave rise to a shower of promises towards the needful medal die, eight and a-half guineas being subscribed round the table. The following is an abstract of the report and balance-sheet:

REPORT FOR YEAR 1907.

Your committee beg to report that during the year 1907 two successful exhibitions of winter-flowering carnations were held at the Royal Botanic Gardens, Regent's Park. To the council and executive of the Royal Botanic Society this society is deeply indebted for the admirable arrangements made for the comfort and convenience of visitors and exhibitors, and for the liberal treatment the society has received at its hands.

Your committee note with satisfaction that at the show held on December 11, 1907, the classes set apart for amateurs were considerably better filled than formerly.

Your committee is pleased to be in a position to show a credit balance in the accounts for 1907, and to report that at December 31, 1907, the total membership was 159. Your committee beg to call the attention of members to the necessity of paying their subscriptions promptly.

The committee has had under consideration the compilation and printing of a pamphlet—with articles contributed by the principal growers—on subjects pertaining to the cultivation, etc., of winter-flowering carnations. In view, however, of the initial expense of such a publication, it is, in consequence of the financial position of the society, not considered that this work can at present be taken in hand.

Your committee desire to acknowledge the very valuable assistance given to the society by the horticultural Press, by whose co-operation the aims of the society have been brought to the notice of growers of carnations.

Your committee also take this opportunity of thanking the judges for their valuable services gratuitously rendered at the two exhibitions held in 1907, and they also desire to acknowledge with thanks the kindness of the donors of special prizes—and contributions to the funds of the society by various members during the past year.

The shows held on March 13 and December 11 created much interest in the carnation world, and many of the leading amateurs and growers were present. The attendance of the general public also was very large on the occasion of both shows.

BALANCE-SHEET FOR 1907.

RECEIPTS.

To Balance in hand at December 31, 1906		£17 16 1
Members' Subscriptions and Donations in 1907		62 12 6

Charges on Guernsey Cheques		0 1 0
Balance in Hand		4 1 7
		£112 9 1

The revision of the rules was then proceeded with, and the most important matter was the alteration of the title of the society to that of Perpetual-flowering Carnation Society. This was adopted unanimously, but it was very clearly understood that the winter-flowering carnations would be those to receive the greatest encouragement. The question of the show date caused some little discussion; it was agreed that "one or more" shows be held; and that a show be held between December 1 and December 15, if the committee could possibly arrange for it during that period. On the motion of Messrs. Hawes and Witty the rules, as amended, were adopted.

A draft of rules for the registration of names of new carnations was then submitted. The rules, fifteen in number, appear to provide for everything necessary. The need for registration to prevent duplication was obvious. The registration fee is 10s. 6d. No variety will be considered for an award unless registered. Any registered variety, if exhibited under another name, will disqualify its exhibitor. If a raiser registers a name, and fails to submit a new variety under that name to the committee within twelve months, he forfeits his fee, and loses all claim to the name. These regulations, with very slight alterations, were adopted—a very necessary piece of useful work.

The meeting then proceeded to the election of officers. Mr. J. S. Brunton was unanimously re-elected chairman, and Mr. S. Mortimer as vice-chairman. Mr. Hayward Mathias was re-elected hon. secretary and treasurer, and Mr. E. F. Hawes was appointed exhibition secretary. Mr. C. H. Curtis was re-elected auditor, and Mr. R. Pinches was elected as his colleague in place of Mr. A. Dean, who retires. There were six retiring members of committee, all eligible for re-election, but it was necessary to elect eight members to bring up the total of the committee to eighteen, as per the new rules. There were fifteen nominations, those duly elected being Messrs. E. F. Hawes, A. F. Dutton, C. Englemann, C. Walters, A. Smith, W. E. Wallace, M. Allwood, and Dr. G. Kyffin.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, March 31.

Present: Mr. E. A. Bowles, M.A., F.E.S. (in the chair); Rev. W. Wilks, M.A.; Messrs. H. T. Gussöw, G. S. Saunders, E. M. Holmes, A. Worsley, J. T. Bennett-Poë, H. J. Elwes, L. de B. Crawshay, G. Gordon, G. Massee, A. R. Rolfe, and F. J. Chittenden (secretary).

INHERITANCE OF ALBINISM IN ORCHIDS.—Mr. C. C. Hurst, F.L.S., sent the following notes in relation to this subject, which has been brought up at several meetings recently. "Since my last communication, I have had an opportunity of examining some plants of Paphiopedilum insigne Sanderæ. Much to my surprise, I found distinct traces of purple sap in the basal margins of both the old and young leaves. The plants were not in flower, but I am told on good authority that some minute spots are also to be found on the dorsal sepal. In view of this it would appear that P. insigne Sanderæ, so long regarded as an albino, is in reality a coloured form in which the purple sap is present in minute quantities. In accordance with the provisional scheme suggested in my last note, P. insigne Sanderæ will therefore be carrying both the colour factors C and P, and when mated with albinos may be expected to give coloured hybrids, as it has done in the case quoted by Mr. Rolfe. It would be interesting to know if the two other yellow forms P. insigne Sanderianum and P. insigne Macfarlanei, recorded as unspotted, are true albinos, and what they produce when crossed.

"If P. insigne Sanderæ is not an albino it must be deleted from my tables of albino crossings, which will now read as follows:

Table A.

1, P. callosum Sanderæ (P) x P. callosum Sanderæ (P) gives albinos (PP).

2, P. Lawrenceanum Hyeanum (P) x P. Lawrenceanum Hyeanum (P) gives albinos (PP).
3, P. Lawrenceanum Hyeanum (P) x P. callosum Sanderæ (P) gives albinos (PP).
4, P. bellatulum album (C) x P. callosum Sanderæ (P) gives coloured hybrids (CP).
5, P. bellatulum album (C) x P. Lawrenceanum Hyeanum (P) gives coloured hybrids (C P).

Table B.

1, P. bellatulum album (C) x P. bellatulum album (C) should give albinos (C C).

Mr. Rolfe's theory that the colour reversions are due to the fact that the albinos crossed belong to diverse species, fails to account for the cases in sweet peas, stocks, and other plants where two albino individuals of the same species, variety, and race, may revert to coloured forms when crossed. On the other hand, the conception of complementary colour factors satisfactorily explains all the known phenomena of colour reversions in plants and animals, so far as they have been critically and experimentally studied."

PSOCIDEÆ INJURING PLANTS.—Some time since Mr. Stanton Brown, A.R.H.S., of The Cedars, Breadsall, Derby, sent a number of insects from oleander, etc., which were identified as Cæcilius Dali, an insect belonging to the Psocideæ, and known only to feed upon spores of fungi and similar things. Mr. Brown now sent some pieces of recently struck cuttings of Salvia splendens, upon which the insects occurred in great numbers. These cuttings were injured by insects, and Mr. Brown said that the injury was solely due to the work of these insects, which did not appear at all particular with regard to the plants upon which they feed. This adds another to the already long list of insect pests in plant houses. Mr. Saunders took the plants for further examination.

LARCH WITH GALL-LIKE GROWTHS.—Mr. H. J. Elwes showed a one-year-old shoot of larch taken from a young tree in his nursery having several gall-like growths along several inches of its growth. The shoot was referred to Mr. Massee, who undertook to obtain some information upon it if possible.

ORCHID HYBRIDS.—Mr. R. A. Rolfe, on behalf of M. E. Cappe, Vésinet, France, exhibited two very diverse hybrids raised from the same seed pod of Lælio-cattleya Cappei (a hybrid from L. cinnabarina x C. Warscewiczi), the result of fertilising a flower with mixed pollen from Lælia flava and Cattleya Mendeli. One flower appeared to be a true hybrid between L.-c. Cappei and C. Mendeli, whose characters were well blended, but the other closely resembled Lælia Cowani (a supposed hybrid between L. flava and L. cinnabarina) in size. It was suggested as a case of dissociation of the "mixed character" whereby an ovule of L.-c. Cappei, from which the character of C. Warscewiczi had been eliminated, had been fertilised by a pollen tube from Lælia flava.

FRUIT OF EUONYMUS JAPONICUS.—Thomas Peed, Esq., of High Cliff, Ventnor, I.W., sent fruits of Euonymus japonicus. This plant not uncommonly produces ripe fruits in this country, and Mr. Chittenden said he had on one occasion found a seedling on the town rubbish heap at Chelmsford.

SCALE INSECT ON HOLLY.—Mr. Saunders reported that the insect attacking holly shown at the last meeting from Ipswich, was the very local scale insect, Aspidiotus britannicus. He recommended that the holly hedge should be thoroughly sprayed with paraffin emulsion, taking care that both surfaces of the leaves received the spray; or the hedge might be fumigated with hydrocyanic acid gas, if some means of enclosing it could be devised.

YUCCA AND AGAVE DISEASE.—Mr. H. T. Gussöw reported that he had examined the leaves of yucca and agave shown at the last meeting by Mr. Saunders, and found they were attacked by the fungus Coniothyrium concentricum, a common fungus in America, and previously recorded in this country. He recommended that to stop its spread the leaves should be dipped in a one per cent. solution of copper sulphate.

Orchid Show at Manchester.

APRIL 1 and 2.

The Manchester and North of England Orchid Society held, at St. James's Hall, an exhibition of orchids that surpassed all previous northern efforts, and the display should be the means of enlisting further sympathy with this important sphere of floriculture. The society has been doing good work for some years past, having frequent displays at the Coal Exchange. The success that attended them has induced the society to extend its operations, and this show was one of the results. Undoubtedly the magnificent array of plants staged should be the means of popularising both the society and the charming flowers that it fosters. The charming collection from Messrs. Armstrong and Brown, Tunbridge Wells, proved a theme of general commendation, and there was a remarkable consensus of opinion that their group was the finest yet staged at Manchester. The table space was sixty feet by eight feet, and in the group were 600 plants of high quality. These included about 150 plants of Dendrobium nobile virginale, and in the centre was an imposing display of choice odontoglossums, dendrobiums, etc. The premier award, consisting of a gold medal and an illuminated vote of thanks, was made in favour of the firm. The firm was also awarded class certificates for Brasso-cattleya Boydæ var. Thompsonii, and Dendrobium nobile magnificum; and an award of merit for Dendrobium George Woodhams.

Messrs. Charlesworth and Co., Heaton, Bradford, staged a smaller number of plants, but their group contained many rare varieties, and was therefore of special interest. A gold medal was deservedly awarded to the collection, and Messrs. Charlesworth were granted first-class certificates for Brasso-cattleya Bradshawæ superba, Cymbidium Holfordianum, Phalænopsis Sanderiana Wigan's var., and Odontoglossum His Majesty.

Messrs. Cypher, Cheltenham, were awarded

SPECIAL. OFFER of PERPETUAL-FLOWERING CARNATIONS.

A HOUSE OF WHITE PERFECTION, 100ft. by 21ft.—Taken Dec. 4th, 1907.

COLLECTION of 9 1907 Novelties for 12/6.
Carriage paid.

COLLECTION of 12 of the leading varieties for 10/6.
Carriage paid.

COLLECTION of 24 of the best varieties 20/-.
Carriage paid.

STRONG PLANTS only will be sent, and satisfaction guaranteed.

Having upwards of 100,000 plants to select from I am able to give satisfaction to all customers.

PERSONAL INSPECTION CORDIALLY INVITED.

SEVEN GOLD AND SILVE MEDALS and numerous Prizes have been awarded me for Carnations during the last ten months.

W. H. PAGE, Tangley Nurseries, Hampton, MIDDLESEX.

Telephone: 219, Post, Kingston.
Telegrams: "Page, Hampton."

a gold medal for a highly meritorious display; they also received a first-class certificate for Lælio-cattleya callistoglossa Sultan, and an award of merit for Brasso-cattleya Thornton's gigantea. Messrs. Hugh Low and Co., Bush Hill Park, Enfield, were awarded a gold medal for a pleasing display of orchids, and a charming contribution of cut carnations of well-known varieties, with miniature roses and palms.

Messrs. W. Cutbush and Son, Highgate, were exhibitors of hardy forced plants, and were awarded a gold medal. Their arrangement of finely-flowered lilacs, laburnums, azaleas, pyrus, and rhododendrons was most attractive, and came in for a full share of praise.

Messrs. Sander, St. Albans, contributed a smart collection of orchids, Lælio-cattleya Empress of Russia being especially noteworthy; this firm also staged some excellent anthuriums; silver-gilt medal. Mr. F. A. Ward, Northenden, contributed a good array of odontoglossums in variety; silver-gilt medal. Mr. John Robson, Altrincham, staged orchids in variety, interspersed with cut roses, and was awarded a silver-gilt medal. Mr. W. Thompson, Stone, staged a well-grown group of odontoglossums, and received the distinction of a silver-gilt medal; he was also granted a first-class certificate for Odontoglossum exultans. Messrs. McBean, Cooksbridge, who were strong in odontoglossums, also received the award of a silver-gilt medal.

Silver medals were awarded to the under-mentioned exhibitors: To Mr. E. Ashworth, who contributed cypripediums and odontoglossums in his usual excellent manner; to Mrs. Hodgkins, for a pleasing table decoration and skeleton leaves; to Messrs. Frank Dick and Co., Manchester, for cinerarias and cut flowers; to Messrs. Moore and Co., Leeds, for an excellent group of orchids; to Messrs. A. J. Keeling and Sons, Bradford, for orchids, including Dendrobium Chessingtonense, which received an award of merit; to Mr. R. Ashworth, Newchurch, who staged good odontoglossums, and received a first-class certificate for O. ardentissimum album, and awards of merit for O. æthiopica, O. Aug-Harrio crispum, and O. Atalanta Aug crispum; to Mr. J. Bromilow Rainhill, for cypripediums, representing good types, especially noteworthy being C. concolor var. Emperor, and C. microchilum, which received first-class certificates, and C. Wootoni, C. Euryades superba, C. Dowlingiana, C. Boadicea magnifica, which had awards of merit made in their favour; to Mr. J. E. Williamson, Stretford, for a small but telling collection of orchids; to Mr. A. Warburton, for a general collection; and to Messrs. Dickson, Brown, and Tait, Manchester, for an effective arrangement of daffodils, Primula Kewensis, and chionodoxas, and other seasonable subjects. Bronze medals were awarded to Messrs. A. Warburton, R. Jenson, Hayward's Heath, and J. Edwards, Sherwood. Mr. Norman C. Cookson received a first-class certificate for Phaius Clive, of which an illustration is given in this issue; and an award of merit for Calanthe delicata. The attendance on the opening day was small in comparison with the merits of the exhibition.

The Horticultural Club.

THE TULIP.

After the usual monthly dinner of this club, held at the Hotel Windsor on Tuesday, the 31st ult., under the chairmanship of Mr. W. A. Bilney, the Rev. Joseph Jacob gave an extremely interesting lecture on "The Tulip and its History." The cult, as he pointed out, was one of considerable antiquity, since even as far back as 1554 their beauty was appreciated and recorded by noted botanists of the time, and both Clusius and Gerard refer to them in 1573 and 1597. By 1634, indeed, the tulip had attracted so much attention, and had produced so many varieties in evidence of its peculiar sportive character that the tulip mania commenced, new forms fetching fabulous prices far and away exceeding even those realised by the rarest orchids of to-day, one bulb of an unnamed form actually being sold for £5,000. Speculation, indeed, reached the verge of insanity, and it is recorded that two bulbs only of a rarity existing, the owner of one paid a small fortune for the other, which he at once destroyed to render the remaining one "unique." Madness could hardly go further, and it is therefore not a matter of surprise that a reaction followed, so that in 1637 tulip fanciers of the speculating kind tried to realise, with the result that a "slump" followed. The States-General of Holland stepped in and instituted regulations, and by 1638 common-sense had reasserted itself. Eventually in 1730-40 popular taste turned to American plants and tulip cultivation fell into the background, but the varieties by this time ran into thousands. The first double tulip, T. lutea centifolia, is recorded in 1665, and Parrot tulips came to the fore in 1690. The origin of these appears to be somewhat mysterious, since they agree, when in form, with no known species. France appears to be the locality where they are first recorded. The curious fact was stated by the lecturer that in a catalogue issued at the end of the eighteenth century the quoted varieties of ranunculus far exceeded those of the tulip, two bulbs of each of 500 kinds being offered for £30.

From 1820 to 1840 there was waged the war between the florist tulip connoisseurs of the north and south, the former considering the character of the marking to be the first essential, and the latter the purity of the flower. The precise shape of the flower was also a vexed question, Glenny fixing it as a cup embracing one-third of a sphere; Groom, another authority, at one-half; and Slater, a third expert, at nine-sixteenths. In 1849 the National Tulip Society was founded, and tulip cultivation was greatly in favour. In tracing the history of the flower up to the present date, the lecturer interpolated with the data above cited a number of very interesting facts relating to the introduction of new varieties and species. There is no doubt that we owe the majority to the East, but it appears to be somewhat an open question how far the native tulips of Italy, France, and elsewhere, may not have played their part, while curiously enough the wonderfully distinct section of the May-flowering tulips appears to be due to survivals in old cottage gardens from an unrecorded source.

The subsequent discussion was rendered more interesting by the presence of Mr. Krelage, of Haarlem, and Messrs. Barr, Ware, Wallace, and Jenkins, all experts in this particular line. Mr. Druery mentioned a colony of T. undulatifolia, a fine scarlet form which he met with in the vicinity of Smyrna, the bulbs being massed in hard, bare, stony ground, the heat of which at midday was so great that the hand could hardly bear it, a point indicating the need of bright sunshine for perfecting the bulbs. Some interesting remarks were made concerning that unique peculiarity of the tulip, namely the "breaking," as it is called, of the flower into coloured forms, which are preceded in the seedling, for it may be six or seven years, by altogether different and uniform tints, so that the breeder's patience is often sorely taxed before he can know what is the result of his sowing. A hearty vote of thanks was accorded to the lecturer, and also to Mr. Krelage and the other experts who had contributed to the subsequent discussion.

The Nurserymen, Market Gardeners' and General Hailstorm Insurance Corporation, Lim.

The 13th annual general meeting of this company was held at 41 and 42, King Street, Covent Garden, on Friday, 3rd inst. The accounts showed an increase in the year both as regards premium income and interest. The year had been peculiarly free from hailstorms, but two further claims had been settled since the accounts were closed. During the 13 years the premium income had increased from £681 1s. 9d. to £2,476 13s. 10d., which showed that the company was meeting a distinct need and becoming better known. A dividend of 7½ per cent., and bonus of 2½ per cent., making £1,000 in all, was declared, and £1,500 added to the reserve fund, making the reserve £13,500. The invested funds at the end of the year amounted to £23,969 0s. 7d. The company were not paying big dividends, but were building up their reserve fund against heavy claims which might come in at any moment. The area insured now amounted to over 35,500,000 square feet of glass.

Sandhurst Gardeners' Association.

The usual fortnightly meeting was held in the Church Schools, Sandhurst, on March 31, when Mr. J. Evans presided over a good attendance of members. The subject for the evening was "Carnation Culture," and this was introduced by Mr. Dennison, of The Gardens, Easthampstead Park, in a very able and practical paper. A short history of the carnation was given, and this was followed by full details for the cultivation of the several sections. A good discussion followed, among the speakers being Messrs. Evans, Cooper, Chapman, Dupond, Townsend, and M. Goddard. A hearty vote of thanks was accorded Mr. Dennison for his most useful paper.

Mr. Townsend, Sandhurst Lodge Gardens, staged odontoglossums and dendrobiums; Mr. Dupond, Crowthorne Nurseries, contributed oranges in pots; and Mr. M. Goddard, Ambarrow Gardens, exhibited excellent examples of Cyperus alternifolius variegatus.

Beckenham Horticultural Society.

On Friday, the 27th ult., with Mr. Sherley-Price (one of the vice-presidents) in the chair, Mr. R. B. Leech, F.R.H.S., of Wood Hall Gardens, Dulwich, gave a lecture on "Syringing and Damping Down Fruit and Plant Houses." The lecturer is of opinion that these operations are too often done indiscriminately, and to excess; and considers it detrimental to the occupants of glasshouses, and not conducive to the best results. Mr. Leech spoke some time on the "respiration" of plants, and suggested much that is worthy of thought, and specially recommended the young members to study this function from "Kerner's Natural History of Plants." At a future date the lecturer will deal with the subject from a practical standpoint. Hearty votes of thanks were accorded both lecturer and chairman. A vase of splendid spathes of Anthurium Scherzerianum varieties, exhibited by the lecturer, was awarded the society's special certificate.

Redhill Gardeners' Association.

This association held its fortnightly meeting at St. Matthew's Parish Rooms on March 31, with Mr. W. P. Bound in the chair. Five new members were enrolled. Mr. Harrison Dick gave a most interesting and instructive lecture entitled "Famous Old-time Gardeners," which was illustrated by lantern slides. Mr. Dick spoke on the lives of several famous horticulturists, and gave a description of the remarkable results achieved with the crude utensils they had at their command. At the close of the lecture a hearty vote of thanks was accorded the lecturer on the motion of Mr. Bound, seconded by Mr. Herbert.

FORTHCOMING ENGAGEMENTS.

The Editor is always glad to receive intimation of exhibitions, and copies of schedules.

TUESDAY, April 14.—Royal Horticultural Society; Fruit, Floral, and Orchid Committees meet at 12 o'clock; Narcissus Committee at 11.30 a.m.; lecture at 3 p.m. on "Hardy Cacti and Other Hardy Succulents," by Mr. E. A. Bowles, M.A., F.L.S.; Scientific Committee at 4 o'clock.
WEDNESDAY, April 15.—Royal Society of Arts.
Royal Caledonian Horticultural Society's Spring Show; two days.
Tunbridge Wells Daffodil Show.
British Gardeners' Association, meeting at Eccles Rooms, Blackburn, 7.30 p.m.
THURSDAY, April 16.—Brighton Horticultural Society Meeting; lecture on "Botany for Gardeners," by Mr. E. F. Hawes.
MONDAY, April 20.—Easter Monday.

ANSWERS TO CORRESPONDENTS.

YOUNG GARDENERS AT KEW.—C. H. N., Woodford Green: It is necessary tha candidates for admission to the Royal Gardens, Kew, should have had some years' training in private gardens or commercial establishments. You will be able to obtain the official regulations from the Curator, Mr. W. Watson, Royal Gardens, Kew.

TRAPPING EARWIGS.—H. H. A., Northwick: With perseverance there should be no great difficulty in exterminating the earwigs that have invaded your cucumber house, and are doing much damage to the occupants. We suggest that you should take advantage of the habit of these pests of resorting to some dry hiding place during the day, and proceed as follows: Take a certain number of 5-inch pots that are quite clean, and fill them lightly to about one-half their depth with dry hay. Lay the pots on their sides in convenient positions about the house, and, following their usual bent, the earwigs will, early in the morning, hide themselves in the hay. In the course of the forenoon take a pail of water as near the boiling point as practicable, and with one hand take up the pots one by one, hold them over the pail, and with the other hand withdraw the hay and shake the earwigs that are congregated in the pot and hay into the pail of water. Strong brine would serve the same purpose. It is important the interior of the pots and hay should be quite dry, and therefore should the latter become damp, renew it with fresh. There will be less likelihood of the hay becoming damp if you insert short stakes in the bed and invert the pots containing the hay on them. It will suffice if the stakes stand fifteen inches or so above the surface of the bed. It will, perhaps, be well to lay one-half of the pots on their sides and place the other half on stakes. You will, of course, continue the trapping until the earwigs have all been caught. We shall be glad to hear the results.

UNHEALTHY PELARGONIUMS.—R. M. W., Surrey: The plant you have sent us suggests that the soil in the boxes in which the zonal pelargoniums are growing has become sour. We would advise you to at once turn them out of the boxes, shake the soil from about the roots, and put them singly in three-inch pots. If the space at your command will not admit of their being potted separately, put them in other boxes that are efficiently drained, and use a moderately rich turfy compost.

VARIOUS.—Young Gardener, Southampton: The premature falling of the flower buds of the young peach trees is probably due to their excessive vigour, and we suggest that they be root pruned in the autumn. If the trees have their roots moderately shortened early in October their exuberant vigour will be checked, and they will in due course be brought into a fruitful condition. You must be careful not to give them additional manurial matter during the season of growth, either in the form of top-dressings or liquids. It is not unusual for plants of Azalea mollis that are potted up in the autumn to shed their flowers as soon as they open, when they are forced early in the following year: more especially are they liable to do this when obtained from a distance and allowed to remain some time before they are put in the pots. The best results are obtained from plants that are grown for a year in pots; but those lifted from beds and borders with a good ball of soil, and put at once in pots, should flower satisfactorily. Sometimes these shrubs fail to give good results in consequence of the soil being kept too dry during the winter.

PALMS FOR THE DRAWING-ROOM.—Miss M.: Some of the best of the palms for growing in the drawing-room are Kentia Belmoreana, an elegant species of medium growth, with pinnate leaves; Chamærops humilis, a small growing fan palm; C. Fortunei, a fan palm of medium growth; and Phœnix rupicola, an extremely elegant species with pinnate leaves, and especially suitable for medium-sized and ornamental pots when from eighteen to thirty inches high. If you require two kinds only, we would advise you to grow Kentia Belmoreana and Phœnix rupicola. We have successfully grown the elegant Cocos Weddelliana in the drawing-room, but in houses within the range of the fogs of London and other populous towns, the plants are liable to lose their leaves during the winter months.

TRANSPLANTING HOLLIES.—F. B. H.: This is a most suitable time for transplanting specimen hollies and small hollies for hedges. Plants that have been recently transplanted, as in the case of nursery stock, may be moved with but little if any risk, provided the work is smartly done. In the case of large specimens that have occupied the same position for several years, it will be better to wait until next year, and in the meantime prepare them for their removal. In preparing the large hollies for removal, open out a trench round them at a distance of about two feet. The trench should be rather deeper than the roots, and the spade be worked underneath the ball to sever any roots that may have descended perpendicularly into the subsoil. In moving hollies at this season of the year, it is important to avoid exposing the roots to atmospheric influences longer than is necessary, and to well water them in. Syringing them overhead in the evening after a fine, dry day will also materially assist them in recovering from the check received.

ADDRESS.—W. T., Walsall: We are sorry we are unable to give the address about which you inquire.

PEAS.—Y. G., Southampton: The following is a good selection of established varieties: Dorothy Eckford, King Edward, John Ingham, Mrs. Collier, Lord Nelson, Mrs. Hardcastle Sykes, Helen Lewis, Lady Grisel Hamilton, Duke of Wellington, Dainty, Sybil Eckford, Black Knight, Jessie Cuthbertson, Jeannie Gordon, and Helen Pierce. We suggest that you sow the seed at once in deeply dug and liberally enriched soil, and that you remove the flower buds as they appear until the beginning of July. Three excellent culinary peas for your purpose are Peerless Marrowfat, Quite Content, and Talisman.

WILLOW-LEAVED IXORA.—W. Smith, Sussex: The Willow-leaved Ixora (I. salicifolia) is less robust in growth, and not so free in blooming as such hybrids as I. Fraseri and I. Williamsi, but it is so elegant in habit and effective in colour as to be well worthy of the additional care it requires. It is usually more vigorous on foster roots than on its roots, and we would suggest that you graft it on I. javanica or one of the strong-growing hybrids.

CARNATIONS.—W. B. M., Leicestershire: So far as we are able to determine from the shoots sent, your plants have been injured by sparrows, which are in some districts very troublesome to these flowers early in the year. Some manurial assistance to the plants at the present time will be highly beneficial, and we would suggest that you give the beds a top dressing of an approved artificial fertiliser, such as you will find in our advertisement pages, or bone meal. Apply the fertiliser or bone meal at the rate of 2oz. to the square rod, lightly bury it with hoe and rake, and then tread the soil lightly about the plants to give them a firm root run.

DAHLIAS FOR THE GARDEN.—R. M., Dorset: So much depends upon personal taste that it might prove disappointing were we to suggest that one of the sections is the "best" for the garden. Some owners of gardens prefer the formality characteristic of the flowers of the show and pompon varieties, while others have a preference for the light, elegant blooms of the cactus and single varieties. We would advise you to grow a small selection each of the cactus and pompon and single varieties, as you will then have a greater variety in your garden, and a wider range for selection in cutting flowers for indoor decorations. Each selection should consist of varieties of compact habit, and having flowers with comparatively long, stiff stems, as they are more effective in gardens, and the flowers can be more readily arranged when in a cut state. If you will inform us as to the sections that you prefer we will give you selections specially adapted to garden culture. We would advise you to make your arrangements early and purchase the plants not later than the end of the present month. If you do this, and at once shift them into six-inch pots and keep them for a fortnight or so in frame or pit without fire-heat, you will have by the end of May strong plants that will at once commence to make new growth and become established. By taking this course there will be a gain of at least a fortnight as compared with plants that remain in three-inch pots until bedded out, and this is a point of no small importance. In preparing the beds and borders for dahlias that are intended for garden decoration, the soil should be deeply dug, and if the soil is rather poor, should be enriched with a moderate application of well-rotted manure from the farmyard or stable. The liberal dressings of manure that are sometimes applied are undesirable, because of their promoting an excessive luxuriance of growth, so inimical to an early and abundant production of flowers; more especially as a luxuriant growth should be guarded against in the case of the cactus varieties.

NAMES OF PLANTS.

W. S.—1, Forsythia suspensa; 2, F. intermedia; 3, Daphne Mezereum album.

G., Herts.—We will give you the names of the specimens you send in our next issue.

B. Robson.—1, Angræcum falcatum; 2, Brassia verrucosa; 3, a fine form of Phalænopsis Rimestadiana.

T. T.—1, Bouvardia Triomphe de Nancy; 2, Sang Lorraine; 3, Dendrobium Wardianum, a poor form, hardly worth growing.

K. H., Hants.—It is not possible to name a shrub from a leafless shoot. If you will send a specimen when the shrub is in leaf we will do our best to assist you.

F. H. S., Dorset.—1, Acacia cultriformis, plant it in the conservatory border, and train the growths up one of the pillars; 2, A. longifolia; 3, Citrus decumana; 4, Posoqueria longifolia.

R. B., Yorks.—1, Davallia elegans polydactyla; 2, send a more developed frond, and one bearing spores; 3, Adiantum capillus-veneris imbricatum; 4, A. rhodophyllum; 5, Acrostichum drynarioides; 6, Cyrtomium anomophyllum.

The Rat Crusade in the Country.—The recommendation of the Board of Agriculture that farmers should combine and exterminate the rats which cause such incalculable damage around the farms and in the fields, seems likely to bear fruit. The Rev. Canon R. Abbay, rector of Earl Soham, Framlingham, has lately been successful in inducing the residents of that important agricultural Suffolk district to apply several hundred tubes of Danysz Virus simultaneously over the whole parish. These tubes were sent for the occasion from the Pasteur Institute, Paris, and laid down under the supervision of a scientific staff from London early this month. The villagers, who themselves subscribed the necessary funds, evinced the most lively interest in the proceedings, and it was amusing to watch the care with which they handled the delicate glass tubes containing the virus, evidently preferring their novel occupation to spending laborious days behind the plough. The virus was applied over an area of 2,000 acres, each farm and homestead being systematically treated in turn by small parties of labourers familiar with the runs and the peculiar habits of the rats of the locality. It is obvious that better results are likely to be obtained by such organised efforts than by spasmodic applications of the virus, and it is to be hoped that the example set at Earl Soham last week will be widely followed throughout the Kingdom.

MARKETS.

KELWAY and SON, Langport.

THE VERY BEST SEASON of the year for planting Kelway's brilliant, new, large-flowered GAILLARDIAS is the present. They will give a striking effect in beds and borders from July to September, and the fine vividly tinted flowers, borne in innumerable quantities on long stems, are grand, and most lasting for cutting for the house. Collection "B," 12s. per dozen. Collection "A," 45s. per 100. KELWAY and SON, Langport.

FOREMAN or good SECOND; well up in all branches; age 28; last place three years; good references. THORNLEY, Sibton Park North, Yoxford, Suffolk.

FOREMAN (Inside), life experience, age 2 can be well recommended; bothy preferred. IVISON, Guisboro' Hall, Guisborough, Yorks.

JOURNEYMAN (First), Inside; 10 years' experience; age 26; can be well recommended; two years last situation; bothy preferred. OSGOOD, 5, Clover Nook, Ackender Road, Alton, Hants.

YOUNG MAN seeks SITUATION as JOURNEYMAN, Inside and Out; three years' experience; age 19; good references. R. COOPER, 27, North Road, Highgate, London, N.

GARDENER (Under or Journeyman), age 21, seeks SITUATION; seven years' experience Inside and Out. Can be well recommended. H. BEE The Gardens, Crown East Court, Worcester.

GARDENER desires Single-handed SITUATION, or as UNDER in good establishment; years' experience; age 30; married. GARDENER, Eden Road, Elmers End, Kent.

UNDER GARDENER or GARDENER-LABOURER; age 19; thoroughly reliable, hard worker. F. REEVES, 81, Chester Road, Watford, Herts.

YOUNG MAN as UNDER GARDENER Pleasure Grounds or Inside and Out; Bothy preferred; disengaged. S. HOLDAWAY, Mott Romsey, Hants.

YOUNG MAN as UNDER GARDENER; age 26; good reference. A. E. FRENCH, Spring Gardens, Northampton.

YOUNG MAN seeks SITUATION Under Gardener; 5 years' references; years. J. SHILTON, 59, Brighton Road, Re

YOUNG MAN, age 22, seeks SITUATION as Under Gardener; 8½ years' experience. Abstainer. herbaceous hand; good references. The Gardens, preferred. G. PASSMORE, The Gardens, Stratford-on-Avon.

IMPROVER (Inside) seeks SITUATION good establishment; age 19; 4½ years' good experience; Bothy preferred; good references. SPRATLEY, The Gardens, Whiteknights, Rea

IMPROVER, under Glass; age 18; 5 years' experience, two Inside; Bothy preferred. EDWD. WILSON will have pleasure in ing a thorough respectable and energetic above. Lilford Hall Gardens, Oundle.

MARRIED MAN as KITCHEN GARDENER or SINGLE-HANDED, life experience; good references; age 26. WRATTEN, House, Hounslow, Middlesex.

RICHARD SMITH and CO., LTD., announce that they are constantly receiving applications from Gardeners seeking Situations they will be able to supply any Lady or Gentleman with particulars, etc. St. John's Nurseries,

Situations Wanted—*continued.*

SITUATION in good Garden by YOUNG MAN, age 20, where he would have opportunity to learn; some experience. State wages, C. CRITCHLEY, 3 Queen's Terrace, near High Street, Cheltenham.

SITUATION required by a middle-aged Scotsman who has had a life experience in all branches of horticulture; has held important positions in Scotland, England, and Ireland, and can be highly recommended for a post as superviser of private or public gardens. Apply, J. M., Office of this Paper.

YOUNG MAN, age 19, requires SITUATION in good establishment. Inside or Inside and Out; two years present; excellent character; free when suited. J. RENYARD, 73, Birkbeck Road, Enfield, Middlesex.

YOUNG MAN seeks SITUATION as ASSISTANT to Estate Carpenter; 6 years' experience in the Building Line; good references. F. GEORGE, Camden Hill, Chislehurst, Kent.

YOUNG MAN, age 19, seeks SITUATION in kitchen garden and pleasure grounds; well recommended. A. BETTS, The Gardens, Knockbrex, Kirkcudbright.

YOUNG MAN (25) seeks SITUATION as LEADING HAND on Pleasure Grounds; used to Horse and Hand Machines, Scythe, Flower Garden, Lawns, etc.; 11 years' experience; good references; 5 years Welham Hall. G. E. OGLE, The Lodge, Kneesworth, Royston, Herts.

YOUNG MAN seeks SITUATION in Kitchen Garden and Pleasure Grounds. H. GARLAND, The Gardens, Epping House, near Hertford, Herts, will be pleased to recommend W. MORGAN as above. Can also drive oil engine; age 22 years; five years' experience; good references.

COWMAN; married; thoroughly understands all kinds of Stock and Poultry, also Separators and Buttermaking; 4 years present place, Surrey preferred. COSTON, Wellington Road, Dartford.

Situations Vacant.

WANTED, strong YOUTH for General Nursery; must be used to the work state age, wage, and reference, to BYRON and SONS. The Nurseries, Bold, Widnes.

WANTED, good working FOREMAN, Inside; good decorator; used to early and late forcing; flower, fruit, and vegetables; carnations a speciality. Wages, 22s. and rooms; duty, 2s. 6d. extra. Apply, stating age. HEAD GARDENER, Priory Gardens, Guisbrough, Yorks.

SITUATION COUPON

To the Advertisement Manager of "THE GARDENERS' MAGAZINE,"
148 & 149, Aldersgate Street, London, E.C.

For APRIL 25, 1908.

A Complete Guide for Planting and Culture of Hardy Plants and Flowers, including Bulbs and Tubers.

EASILY-GROWN HARDY PERENNIALS.

By G. H. VOS, B.A., Editorially supervised by T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

Price **5/-** net; Post Free, packed in box, **5/6.**

Some Features of the Work :—

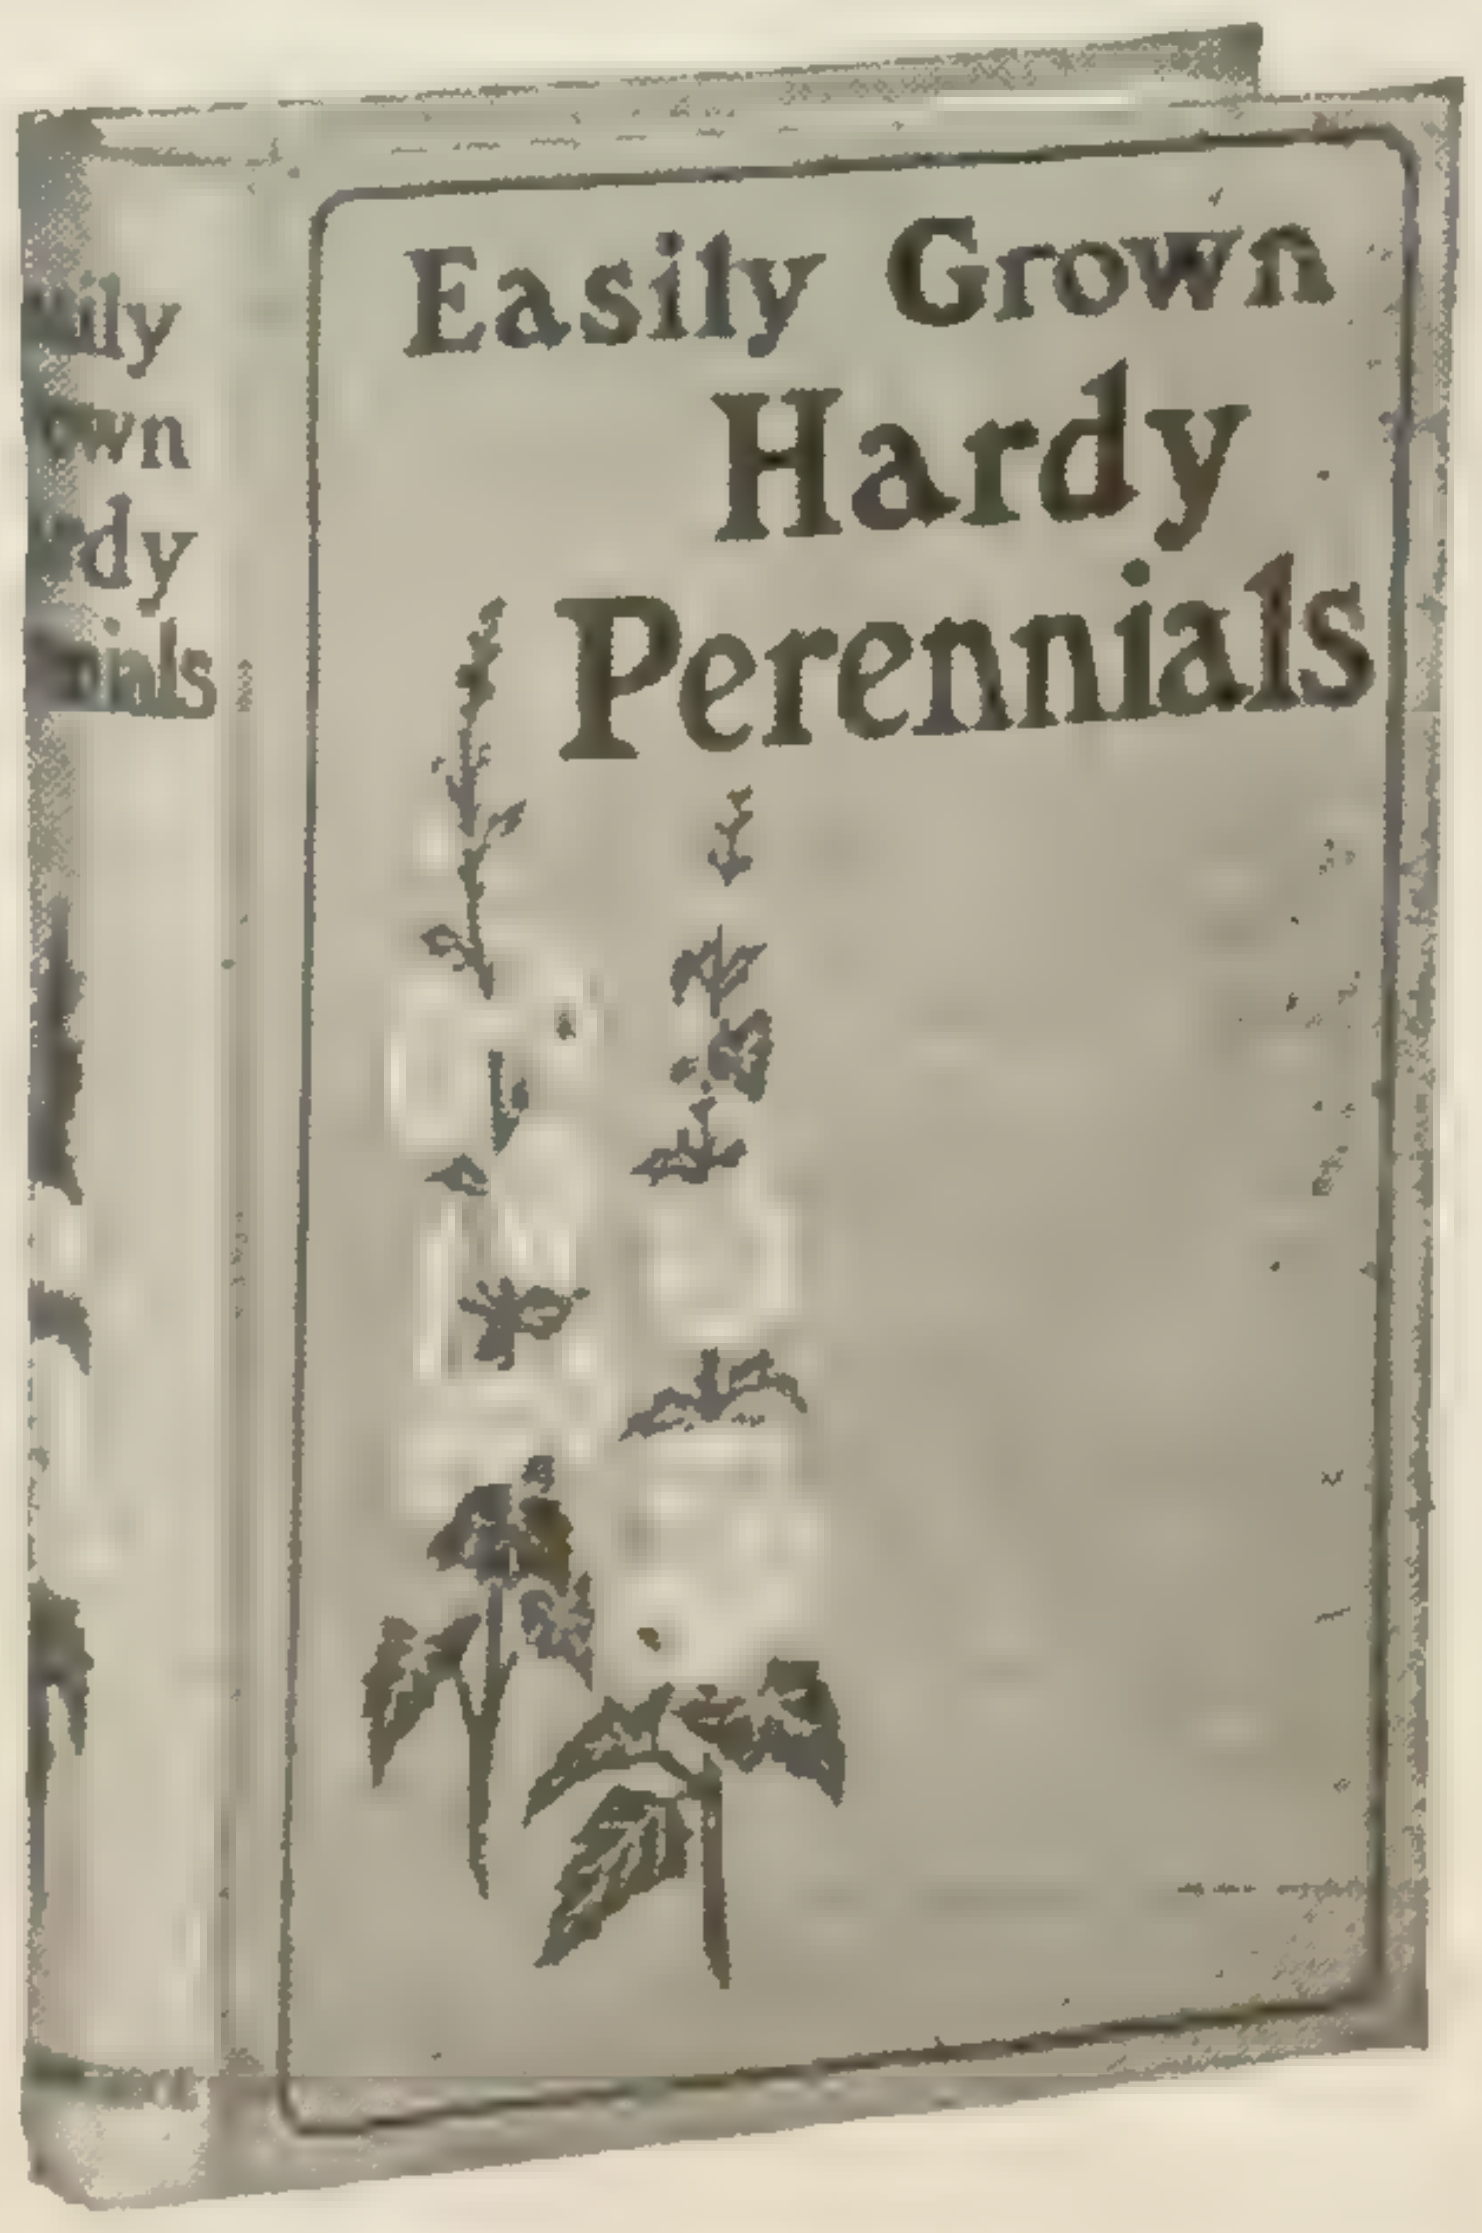
Soil and Position.—The particular soil or compost and position for each genus of plants are very fully and carefully described. Shade and sun-loving plants specially mentioned.

Planting.—The best time and method of planting are also clearly set forth.

Pests.—Special mention is made of any plants likely to be attacked by insect pests, and remedies are given.

Propagation.—The best mode of increasing each family of plants described in detail—seeds, cuttings, and division.

Illustrations.—Two hundred and fifty-five of the most popular species and varieties portrayed, mostly as growing in the garden.



Botanical Name.— Gives the botanical or generic name of each genus of plants described in the book.

Common or Popular Names.—Supplies the common or popular English names of all the plants described.

Natural Order.—The botanical family to which kind belongs.

Habit and Uses.—States whether the plant is fibrous, tuberous, or bulbous rooted, and to what use it can be most effectively put in garden decoration.

Species and Varieties.—Describes the most showy varieties worthy of culture, the colour of their flowers, season of blooming, height and native country.

476 PAGES, AND 255 ILLUSTRATIONS OF PLANTS AND FLOWERS FROM PHOTOGRAPHS.

"The cultural details are very valuable."—*Gardeners' Chronicle.*

NOTES OF THE WEEK.

National Rose Society.

The receipt of a parcel of literature from the National Rose Society is of much interest as evidence of the committee fully appreciating the fact that a society which is national in name, and in its aims, should do something more than hold one or more exhibitions annually, and that they have given practical expression to their appreciation by the provision for the members of additional books relating to the rose. We are especially gratified by this evidence because of the proof it gives of a continuance of the wise policy which was initiated a few years since, and has contributed in no small degree to the almost phenomenal extension of membership and to the increase in the influence and usefulness of the society, which now occupies a commanding position among the organisations that are devoted to special classes of flowers. It would have been well had the committees of two or three other of the special societies adopted a policy akin to that which has been so immensely successful in the case of the National Rose Society. Not only is it probable that they would have now been in a more flourishing condition, but they would have accomplished much more in the extension and improvement of the flowers that justify their existence. In directing attention to the value of supplying the members with literature relating to the respective classes of flowers, we must not be understood as suggesting that competitive gatherings should not occupy the most important position in the year's work. All that we are desirous of doing is to suggest the desirability of societies adopting a policy by which all classes of members will be brought into touch with each other, and that those who do not exhibit or are unable to visit the shows should have a useful souvenir of the year's work. Exhibitions, we need hardly point out, provide a healthy stimulus for cultivators in their endeavour to bring the flowers and other objects in which they are interested to the highest state of development, and give them an apportunity of meeting together in friendly rivalry. Not only do competitive gatherings provide an admirable meeting place for the leading cultivators, but they provide abundant entertainment for those who love and grow the flowers simply for the enjoyment of themselves and their friends, and give them an opportunity of becoming acquainted with the novelties within a short period of their being introduced to cultivation. The publications we have received from the National Rose Society are the "Rose Annual" and "The Enemies of the Rose," two works of much value to those interested in roses, although of unequal merit, that fully justify the congratulations which Mr. E. Mawley, V.M.H., received from Mr. C. E. Shea, who presided at the meeting of the General Committee on Tuesday afternoon. The first of the two publications, although a considerable advance upon last year's "Annual," falls somewhat short of what such work should be. The contents are of great practical value, but just a trifle heavy, and we would suggest that an endeavour be made to make the pages of future issues a trifle brighter. It is, of course, easier to make such suggestions than to give practical effect to them, for there are but few rosarians who can write of their flower in language that so well befits it. The weakest part is the mixing up of the advertisements with the literary matter, and we have a strong objection to having to search among the advertisement pages for the portrait of the president of the society. Of the contents and production of "The Enemies of the Rose" we have nothing but praise, and after a close examination of its pages we have no doubt as to the rather heavy cost being fully justified. It is no ephemeral publication requiring frequent revision, but one that will long remain the text book of the fungoid diseases to which the rose is liable, and of the numerous insect pests that prey upon its various parts. The section of the book devoted to diseases caused by fungi has been written by Mr. George Massee, V.M.H., an authority of the highest eminence; and insect pests have been dealt with by Mr. F. V. Theobald, M.A., who has long been recognised as one of the leading authorities on economic entomology. There are eight coloured plates, in which all the principal insect pests and plant diseases are admirably represented.

MR. EDWIN BECKETT, V.M.H.

Mr. Edwin Beckett, V.M.H., of Aldenham House Gardens, Elstree, Herts, is unquestionably one of the most widely-known gardeners in the United Kingdom. Mr. Beckett was born at Henley-on-Thames, and as his father was a gardener and successful exhibitor, our friend was born into the profession. He was apprenticed under Mr. J. Neville, who is still living at Marsh

Mills, and subsequently he went to the famous Greenlands Gardens, at Henley, Mr. W. H. Good being then head gardener there. Extensive alterations were being carried out at Greenlands, and the gardens had a high reputation for specimen hard-wooded plants. As foreman under Mr. G. King, then gardener to the late Robt. Few, Esq., Wolsey Grange, Esher, Mr. Beckett had considerable experience of exhibiting, the garden being specially notable in those days for its specimen pelargoniums and other soft-wooded subjects. After four years at Wolsey Grange Mr. Beckett became head gardener and bailiff to the late J. McConnell, Esq., of Moor Place, a prominent position for so young a man. On the death of his employer Mr. Beckett took up similar duties at Sandown House, Esher, the residence of J. P. Currie, Esq., and from both these gardens he exhibited largely and successfully. It was in 1885 that Mr. Beckett obtained his great chance of success, as he was then appointed head gardener to the late Lord Aldenham, at Elstree, a position he has filled to everyone's satisfaction. Under the generous encouragement given him by the Hon. Vicary Gibbs, and the late Lord Aldenham, Mr. Beckett has made the fine gardens and pleasure grounds that are the pride of Hertfordshire. As a grower of high-class vegetables, and as the most successful exhibitor of them, Mr. Beckett has gained much fame, but it must not be forgotten that he has been eminently successful with chrysanthemums, and with stove and greenhouse plants, and with hardy fruits, while his knowledge of choice trees and shrubs is a very wide one, and his taste and skill as a landscape gardener are of the highest class. Mr. Beckett has also found time to improve some kinds of flowers and vegetables; he has raised numerous beautiful new Michaelmas daisies and pentstemons, and he has produced unusually fine varieties of culinary peas, celery, and beet. A few years ago Mr. Beckett produced "Vegetables for Exhibition and Home Consumption"; the text first passed through our pages, to which Mr. Beckett is a valued contributor. In local politics Mr. Beckett takes his part, and he is very proud of having been chairman of the parish council at Elstree during the past four years, and a member of the body since its institution.

The Nickerson Prizes for Roses.—Last year Mr. W. E. Nickerson, of Cambridge, Massachusetts, U.S.A., presented to the National Rose Society three silver cups, of the value of five guineas each, for the raisers of the best hybrid perpetual, the best hybrid tea, and the best tea for general cultivation sent out in 1900 or subsequently. The cups were awarded by a vote of the committee to the raisers of Frau Karl Druschki, Dean Hole, and Madame Jules Gravereaux respectively. This year Mr. Nickerson offers twelve cups for the same number of roses, four for (A) climbing roses producing their flowers in clusters, four for (B) climbing roses producing their flowers singly, and four for (C) dwarf roses for beds. The relative merits of the varieties were determined by the vote of the committee, and a number of other rosarians, and the result of the ballot was reported at the meeting of the General Committee of the National Rose Society, held on Tuesday. This was as follows: A, Crimson or red, Crimson Rambler, Grus an Teplitz, Hiawatha. Pink shades, Dorothy Perkins, Blush Rambler, Lady Gay. White, Aimée Vibert, Félicité Perpetué, Bennett's Seedling. Yellow shades, Allister Stella Gray, Claire Jacquier, Aglaia. B, Crimson and red, Ards Rover, Reine Olga de Wurtemberg, Longworth Rambler. Pink shades, Climbing Mrs. W. J. Grant, Climbing Caroline Testout. White, Madame A. Carrier, Una, Macrantha. Yellow shades, W. A. Richardson, Gloire de Dijon, and Madame Jules Gravereaux. C, Crimson and red, Hugh Dickson, Ulrich Brunner, Richmond. Pink shades, Caroline Testout, Madame Abel Chatenay, and La France. White, Frau Karl Druschki, White Maman Cochet, and Viscount Folkestone. Yellow shades, Madame Ravary, Marie Van Houtte, and Souv. de Pierre Notting. The first of each triplet is the cup rose, and the names of varieties that were second and third in the ballot were given for the information of the cultivators.

Foreign Fruits were plentiful in British markets during March, and the aggregate value represents a substantial increase upon that of the corresponding month of last year. Apples were imported in much larger quantities, the total having been 357,484 cwt., of the value of £208,401, or an increase in quantity of 79,151 cwt., of the value of £31,828. Apricots and peaches on the other hand show a relatively large decrease, the aggregate imports having been 62 cwts., of the value of £184. Bananas, as in the case of apples, were more plentiful than in the two preceding years, the total having been 530,107 bunches, of the value of £341,984, or an increase in numbers of 140,241 bunches, and in value of £32,612. In the imports of grapes also there was a large increase, the total having been 5,584 cwt. of the value of £24,138, these figures representing an increase in quantity of 3,783 cwt., and in value of £16,952. In the imports of lemons there was an increase, but nuts and oranges were received in considerably reduced quantities. Pear imports show an increase in quantity of 347 cwt., and in value of £410, the total having been 1,834 cwt. of the value of £4,945. Plums, on the other hand, were received in smaller quantities, the total having been 198 cwt., of the value of £429, as compared with 538 cwt. of the value of £2,851 in March, 1907. The value of the strawberry imports is returned at £2, and of unenumerated fruits the imports were 3,828 cwt. of the value of £6,419, these figures representing substantial decreases. The total value of the fruits for March was £866,248, or a gain of £30,287 as compared with the corresponding month of last year.

The Gardeners' Company.—In the year 1605 King James I. granted by Letters Patent to the gardeners carrying on their business in the City, or within six miles of its boundaries, incorporation as a Guild, and the bye-laws and ordinances of the company were confirmed in the following year. Notwithstanding these letters patents the members of the company had a difficulty in selling their products, owing to the opposition of unqualified persons. The Recorder (Sir E. Littleton), who subsequently became Lord Chancellor, issued in 1632 a warrant for the apprehension of persons using the trade of gardening in contempt of the company's charter, and this warrant continued in force until 1645, and is regarded as having contributed materially to the usefulness of the Guild. The Master, Wardens, Assistants, and Commonalty of the Gardeners' Company have sent a memorial to the Lord Mayor asking permission to present to the Lord Mayor annually a basket containing flowers, vegetables, and herbs, in remembrance of the Recorder's warrant. The Lord Mayor has assented to the request, and fixed Wednesday, July 1, for the first presentation.

Commons and Footpaths Preservation Society.—At the monthly meeting of this society, held a few days since, the proposal of the War Office to conduct manœuvres on a large scale in the New Forest during the coming summer was considered, and it was decided to co-operate with the verderers, commoners, and others interested in taking such action as might be necessary to secure that due regard should be had to the protection of public interests under the Military Manœuvres Act. It was also decided to urge the President of the Local Government Board to amend Section 7 of the Housing and Town Planning Bill now before Parliament. As drawn the Bill would give local authorities power to alienate open spaces committed to their care for the purpose of providing sites for dwellings for the working classes, and it was resolved to press that common land, or land dedicated to the recreation of the public, should be exempted from the operation of the clause. It was reported that the Board of Agriculture had now issued draft schemes for the regulation under the Commons Act, of Towyn Trewan Common, Anglesey, 1,300 acres in extent, and Maidenhead Thicket and Cookham Commons. Also that the litigation with regard to a large and valuable driftway crossing Marsden Moor, Yorkshire, had terminated in favour of the public, and that up to the present subscriptions and guarantees amounting to £1,552 had been received towards £1,800 needed to secure the purchase of Ludshott Common and a strip of land adjoining Waggoners Wells, near Haslemere.

New Daffodils.—A few remarkable new daffodils were shown by Mrs. Backhouse, of The Court, Sutton, Hereford, at the recent meeting of the Royal Horticultural Society, but as they came late, and were placed at the end of a trade group, they received little attention from any but a few experts. A huge finely formed trumpet daffodil, named Harvest, a sort of refined Glory of Leiden; a beautiful white trumpet variety that Mr. Engleheart promptly annexed for a pollen parent; and a flower with an enormous trumpet, and named Jumbo, were three of the most startling varieties in a small set of very fine seedlings. It was a pity the flowers were brought so late, as this permitted the display in only an unimportant position.

Mr. Joseph Mallender, who for the long period of forty years was head gardener at Hodsock Priory, Notts, the residence of Lieut.-Colonel Mellish, has recently retired from the position he has so worthily occupied. Throughout the period he had charge of the Hodsock Priory gardens he associated himself with all the movements that had for their object the advancement of horticulture in the district, and thereby gained the respect of all classes. On it becoming known that Mr. Mallender was relinquishing his charge, his many friends decided to present him with some memento of their esteem, and a few evenings since a meeting was held at the Blyth schoolroom for the purpose of giving practical effect to this decision. There was a large gathering, in which the principal gardeners in the district were prominent, and Mr. Mallender was presented with a marble clock, bearing a suitable inscription, an armchair, and a purse of gold. Mr. Elliott, who presided, and other speakers referred in appreciative terms to the splendid services Mr. Mallender had rendered to the district, and testified to the respect in which he is held.

Grove Hall Park.—Not so long since the Grove Hall Park estate extended over an area of twelve acres, and was so attractively planted with trees as to form one of the few beauty spots of Bow. Now only about three and a-half acres remain, the other portion having been cut up for building purposes. A committee, with Mr. Kitcat, the rector of Bow, as chairman, have been making strenuous efforts to secure the three and a-half acres for a public park and children's playground. Some £200 is still required to enable them to accomplish their laudable object, and as such an open space is an absolute necessity for a populous centre like Bow, we trust this comparatively small amount will be forthcoming. The London County Council, in addition to promising a liberal contribution, will take over and maintain the property acquired.

Hardy Fruit Prospects.—From Rolleston Hall Gardens, Burton-on-Trent, Mr. G. Woodgate writes: The absence of sun during the summer and autumn of 1907, with the exception of the month of September, did not augur well for the ripening of the wood or fruit buds of hardy fruits, that one is very agreeably surprised to find now such healthy wood and prominent fruit buds, on such kinds of trees as are sufficiently advanced in growth for the buds to be readily discerned. Apple and plum trees are thickly studded with fruit buds, and also sweet and Morello cherries. Pears will not be quite so floriferous as they were last year, but are amply furnished with buds, which are fast expanding, and which will, in a short time, providing we do not experience any frosts, make the gardens gay with their blossoms. Strawberries look promising, and all varieties of bush fruits are showing well. Birds, such species as bullfinches and tom-tits, have not been so much in evidence this year as in some past seasons, but those which have been seen have been frightened away with the noise of the gun, so we are not anticipating any great loss of fruit through their depredations this season.

Spraying: Its Needs and Principles.—In America the greatest possible interest is being taken in preventive measures against insect and fungus pests. From State departments and experimental stations a vast amount of literature on the subject of spraying is being sent out regularly, and it is, therefore, not surprising to find "The National Nurseryman" devoting almost the whole of its March issue to the same subject. Spraying formulæ abound, and there are numerous illustrations of spraying machines and kits, while the advertising pages form a general lesson on "Sprayography."

Forestry at Newcastle.—Owing to the success achieved at Lincoln in connection with the forestry section, the Royal Agricultural Society has decided to enlarge the arboricultural features of its exhibition to be held at Newcastle-on-Tyne during the ensuing summer. Silver and bronze medals will be offered in numerous classes, and among other objects invited are boards of various kinds of timber showing the effects of good and bad pruning, the influence of soils on the quality of wood, the damage done by insect infestations, and the ages at which the several kinds of timber reach a marketable size. Plots of ground in the open contiguous to the exhibition buildings will be allotted to nursery firms for the display of both useful and ornamental trees and shrubs, and owners of forests and woodlands are invited to send specimens, photographs, etc., for exhibition only.

NOTES FROM KEW.

◆

Varieties of Begonia semperflorens.

In the greenhouse No. 4, with its wealth of flowering plants, a variety of Begonia semperflorens, from its richness of colouring, stands out very conspicuous. The name is Lumineux, and it was, I believe, distributed by M. M. Vilmorin. It is of a freely branching habit of growth, and naturally forms a neat bushy specimen about a foot high. The flowers are of a bright, glowing, crimson colour, a tint but little represented among fibrous-rooted begonias. There is undoubtedly a future before this variety, as apart from its value for greenhouse decoration at this season, it may prove of great use for summer bedding. In stature greatly exceeding the last-named comes B. semperflorens gigantea rosea, raised many years ago by M. Lemoine, the parents being B. semperflorens and the Mexican B. Lynchiana, which was first distributed as B. Roezli. The variety gigantea rosea may be grown into a quite large plant, but it will also flower freely in pots five or six inches in diameter. The flowers, borne in large panicles, are of a deep rosy hue.

Coreopsis Granti.

One effect of the opening up within recent years of Tropical Africa has been the introduction of many plants therefrom. One of them—Coleus thyrsoideus—has already become popular for winter blooming, and this coreopsis bids fair to be much sought after for the same reason. It is a plant of a half-woody nature, clothed with pretty bipinnate leaves, and the star-like flowers, made up of eight points, are of a bright yellow colour, and about a couple of inches in diameter. For the decoration of the greenhouse during the early months of the year it is likely to become popular. It would appear to be already in commerce, as it has been among the various plants exhibited by Messrs. Veitch at a recent meeting of the Royal Horticultural Society.

Lopezia miniata.

A native of Mexico, and a plant whose introduction dates back to the early years of the last century. It would appear to have been only recently taken in hand, as its name does not occur in the Kew Hand List of Dicotyledons. Botanically, it is a near relative of the fuchsia, belonging, like that, to the natural order Onagraceæ. It is a soft-growing subject, of a half-shrubby character, and naturally forms a dense, bushy specimen. The leaves are ovate, an inch or more in length, and thin in texture. The flowers, borne singly on long, slender stalks from the axils of the leaves, are very curious in shape, the principal ornamental feature being two comparatively large petals, which stand out on either side like wings, thus giving to an expanded flower a good deal of resemblance to a flying insect. The whole bloom, however, is not more than half an inch across, but though individually small, they are borne in such profusion, and are so bright and cheerful, that a plant is, when at its best, a decidedly pretty object. At Kew it is grown in an intermediate temperature.

Hippeastrum pardinum superbum.

A fine group of this pretty and distinct hippeastrum is in flower in the T range. It is an old species, having been introduced by Richard Pearce, of tuberous begonia fame, while travelling in Peru. It first flowered in 1867, and was then distributed at a price of two and three guineas each. The flowers of this are shallow, of a bright cream colour, slightly tinged with green, and profusely dotted with crimson. This applies to the typical form, the variety superbum being so freely freckled with red that very little of the ground colour is to be seen. Hippeastrum pardinum has not been much used by the hybridist in the production of the garden forms of to-day, though occasionally traces of its shallow flower and numerous spots may be seen.

Manettia bicolor.

Once more this good old favourite has had its name changed, apparently without rhyme or reason. As Manettia bicolor it is known to most gardeners, and no one can deny but that name is a very appropriate one. Next, it was at Kew named Manettia luteo-rubra, and as such was figured in the "Botanical Magazine." Lastly, I was astonished to find the name of Manettia inflata, the synonyme on the label being M. bicolor. With all this changing it is small wonder that us poor gardeners, who have but a limited library, should often be in doubt as to the correct name a plant should bear.

Burchellia capensis.

A specimen of this South African shrub in the warmest portion of the Temperate House well serves to show how attractive it is when in full flower. The individual blooms are a little over an inch long, tubular in shape, and of a deep orange-scarlet colour. As the leaves are of a dark green the bright-coloured flowers show up in a marked manner, especially during a dull day, as when I saw it. K.

SEDUM KAMTSCHATICUM FOL. VAR.

The stonecrops of easternmost Asia are generally better garden plants than the European ones, as they thrive apace in the ordinary soil of borders, and give a display in late summer and autumn when most species have passed their best. Typical S. kamtschaticum has been with us a long time, but has not made very great headway, though the variegated form, a more recent introduction, leaped into popularity at once, and is now regarded as a model rock plant, ever presentable, and in summer and autumn capable of forming the prettiest group in the rock garden. Like most stonecrops, it possesses a strong, almost unkillable constitution, and in a light free soil it quickly grows into patches two or three square feet in area, the leaves and flowers combining in a colour scheme of white, green, and gold that cannot fail to please the most exacting.

The lengthy trails are thickly studded with oval leaves, minutely toothed, and whose colouring varies from grey-green to white and yellow, the growths terminating in a flattened cluster of bronze-gold buds that in this stage are superlatively attractive. The transition from buds to flowers, and from flowers to seed capsules is slow, and scarcely noticeable, but all retain the bronze-gold colouring, though there is more yellow than bronze when the flowers are fully open. A plant of this description deserves a prominent place in the rock garden, and one can suggest further uses —that of furnishing the bases of sun-dials. pillars, vases, and other ornaments of stone as a carpeter for plants in vases, etc. It has received the Royal Horticultural Sosociety's Award of Merit, but the surest guarantee of its attractiveness lies in the fact that everyone who sees it in good condition invariably wants it.

G. B. Mallett.

AMONG THE ALPINE FLOWERS.

"Come, gentle spring! ethereal mildness! come!
O, Thomson! void of rhyme as well as reason;
How could'st thou thus poor human reason hum?
There's no such season!"
—Hood, "Spring," A New Version.

It is to be feared that many of us will be inclined as this is written to repeat with consenting note the lines of Hood, as quoted above, for the times are not propitious for singing of the "ethereal mildness" of the season. Cold winds, heavy showers of rain and sleet, and the sight of snow upon the distant and higher hills, all proclaim how unwilling is winter to depart, and how loth is the real spring to drive him from his strongholds.

Yet the spring flowers tell us another tale, and we may well take heart of grace at the promises of the future these give us; true warrants that the warmer days and the sunnier skies are on the way, and that in due course we shall be rejoicing in all our wonted treasures.

Daphne Blagayana.

The daphnes, as a rule, are beautiful things, and we cannot wonder at the myth which made the original of the race the embodiment of Daphne, the daughter of Sileno and Mysis, who was changed into a plant to escape the too ardent advances of Apollo. Nor can we well think of the name and the flower as representing Daphne, the proud wife of Chrysos, the patron of art, as shown in "Pygmalion and Galatea." Perhaps least of all can we do so in the case of one of the prettiest of all the daphnes—D. Blagayana, now in bloom. There is no trace of pride in this plant, whose humility teaches it to trail prostrate along the ground, and whose modesty is typified by its simple white flowers. It is, however, the embodiment of hidden as well as of modest and simply beauty, as its flowers are sweetly fragrant, while the whole aspect of the plant marks it out as one of the prettiest and most desirable of our rock garden shrubs. Then it is one of the shrubs that flourish under affliction, seeing that it only thrives if its shoots are well kept under by the weight of stones. Annually, these pliant branches should have plenty of stones laid on them to weight them down, and only then will this lovely plant flourish as it should.

Mr. Reginald Farrer, in "My Rock Garden," suggests more heroic treatment, although I fear he has allowed his enthusiasm to run away with him. He says: "Daphne Blagayana has been quite good with me ever since I realised that all the plant really wants is to be perpetually stoned with stones like the tomb of Absalom. Plant this lovely Tyrolese daphne in rough peat, and then, every time you pass, hurl a mighty rock on top of him, and pin down all his branches under boulders." I fancy there are few who will "hurl a mighty rock" at this beauty, and it is better to be more considerate, and lay the stone gently, but firmly, upon it. Nay, I think the true lover of alpines and good grower of them whom I have quoted will be found even more considerate than his own words would suggest. But it is not even necessary to use rough peat, as this charming trailing shrub will flourish in rough and stony soil, and will give plenty of its creamy-white flowers from March onwards.

The Pyrola-leaved Alpine Moonwort.

The peculiar treatment required by the daphne reminds one that while we have been, and still are, enjoying the beauties of the charming Soldanella alpina, variety pyrolaefolia, which bears the above popular name, we are really reaping the benefits of a little consideration and artificial methods. These have furnished us with a satisfactory crop of beautiful flowers as are shown by this good soldanella, which nestles so cosily at the base of a rockery, and is well shielded from the coldest winds by having its back to the north wind. Very beautiful is this alpine, with its thick and leathery foliage (pardon, fair Moonwort, the adjective "leathery," as applied to these pretty leaves!), and its little stems well raised above the leaves, and bearing a number of these winsome little, drooping, charmingly toothed, bell-like flowers of a fine purple-blue

It is, it is true, perhaps the most floriferous of all the alpine moonworts, but it would not flower with me so freely were it not that it has been snugly reposing all winter under a sheet of glass, which has to serve instead of its natural covering of snow, which keeps it warm, snug, and dry on the alpine mountains, but which this winter of ours cannot supply. With this put over it in October, and retained until the blossoms show colour, this adorable little flower will give many days of pure delight to the lover of these gentle plants, which are among the most lovely of all alpine flowers. A sandy soil, with plenty of well-rotted turf, leaf-soil, or peat among it, will be a diet which will prove acceptable feeding to these alpine beauties.

The Red Twin-leaved Squill.

To the lover of bulbs there is a wealth of material among the scillas, or squills, and I rejoice in the possession of some delightful varieties, raised originally by the late Mr. James Allen, and sent me by that lamented lover of such flowers. Among these are two or three pink varieties of Scilla bifolia, and these are flowers of considerable beauty. Yet, after all, I question if there is one of these which is superior to the true pink or red-flowered variety of Scilla bifolia, which should be termed rubra, and which must not be confounded with the flesh-coloured one, often sold as rosea or rubra, but which ought really to be called carnea, as it is more flesh-coloured than pink, rose, or red. This deep-hued variety is now very scarce, and, as I had lost it in the dreadful upheaval of transferring my collection of flowers from my old to my present garden, I was indebted for its restoration to a very good friend, to whom I owe many good things. It is again in flower, and my few bulbs are among the most prized of all my flowers of their kind. I do not think the average private grower of bulbs is aware how many varieties of Scilla bifolia are in existence—a want of knowledge to which he owes much of loss.

Crocus aerius majus.

Another good friend, Mr. T. Smith, of Newry, has given one much pleasure by distributing some good things in the way of bulbous and other flowers, and among my enjoyments of the season, not yet passed away for the year, has been the pleasure yielded by a few corms of the fine variety of Crocus aerius, which he has distributed as majus or major. The lovely blue-flowered Crocus aerius is a variable thing, and Mr. E. A. Bowles, our "Crocus King," has raised or selected some very beautiful varieties, which in time to come will be boons to the bulb lover. Mr. Smith's variety is, however, a very beautiful one, and he will perhaps excuse me for remarking upon its size; the deep colour of its blue flowers, made still more exquisite by the lighter hue of the interior, which reminds one of the exquisite colouring of some ancient glass; and the general air of refinement and beauty presented by this fine little flower. Any crocus lover who does not appreciate C. aerius in any of its forms may be banned from the cult and classed no longer as under the banner of the flower of the youth who was the unhappy lover of Smilax.

Other Flowers.

But the pen speeds on, and the sheets before one remind even the most devoted worshipper of the alpine flowers, keen to tell the beauties of his charmers, that he must bring his rhapsodies to a close. But how many things has he omitted.

Here are the first-fruits of the coming of the aubrietias, the snowy masses of arabises; the chionodoxas in blue, sapphire, lavender, white, and pink; the Siberian scillas in blue and white; crocuses in colours almost interminable; the daffodils, all in silver and gold; the last of the snowdrops, lingering in the cooler corners; primroses, white and yellow, and blue and red, and in various hues between; some of the saxifrages, such as Boydi, apiculata, and a few more, harbingers of the host which will shortly follow; the earliest of the muscaris, holding out a hand to the allied hyacinths of the type of lingulatus and azureus.

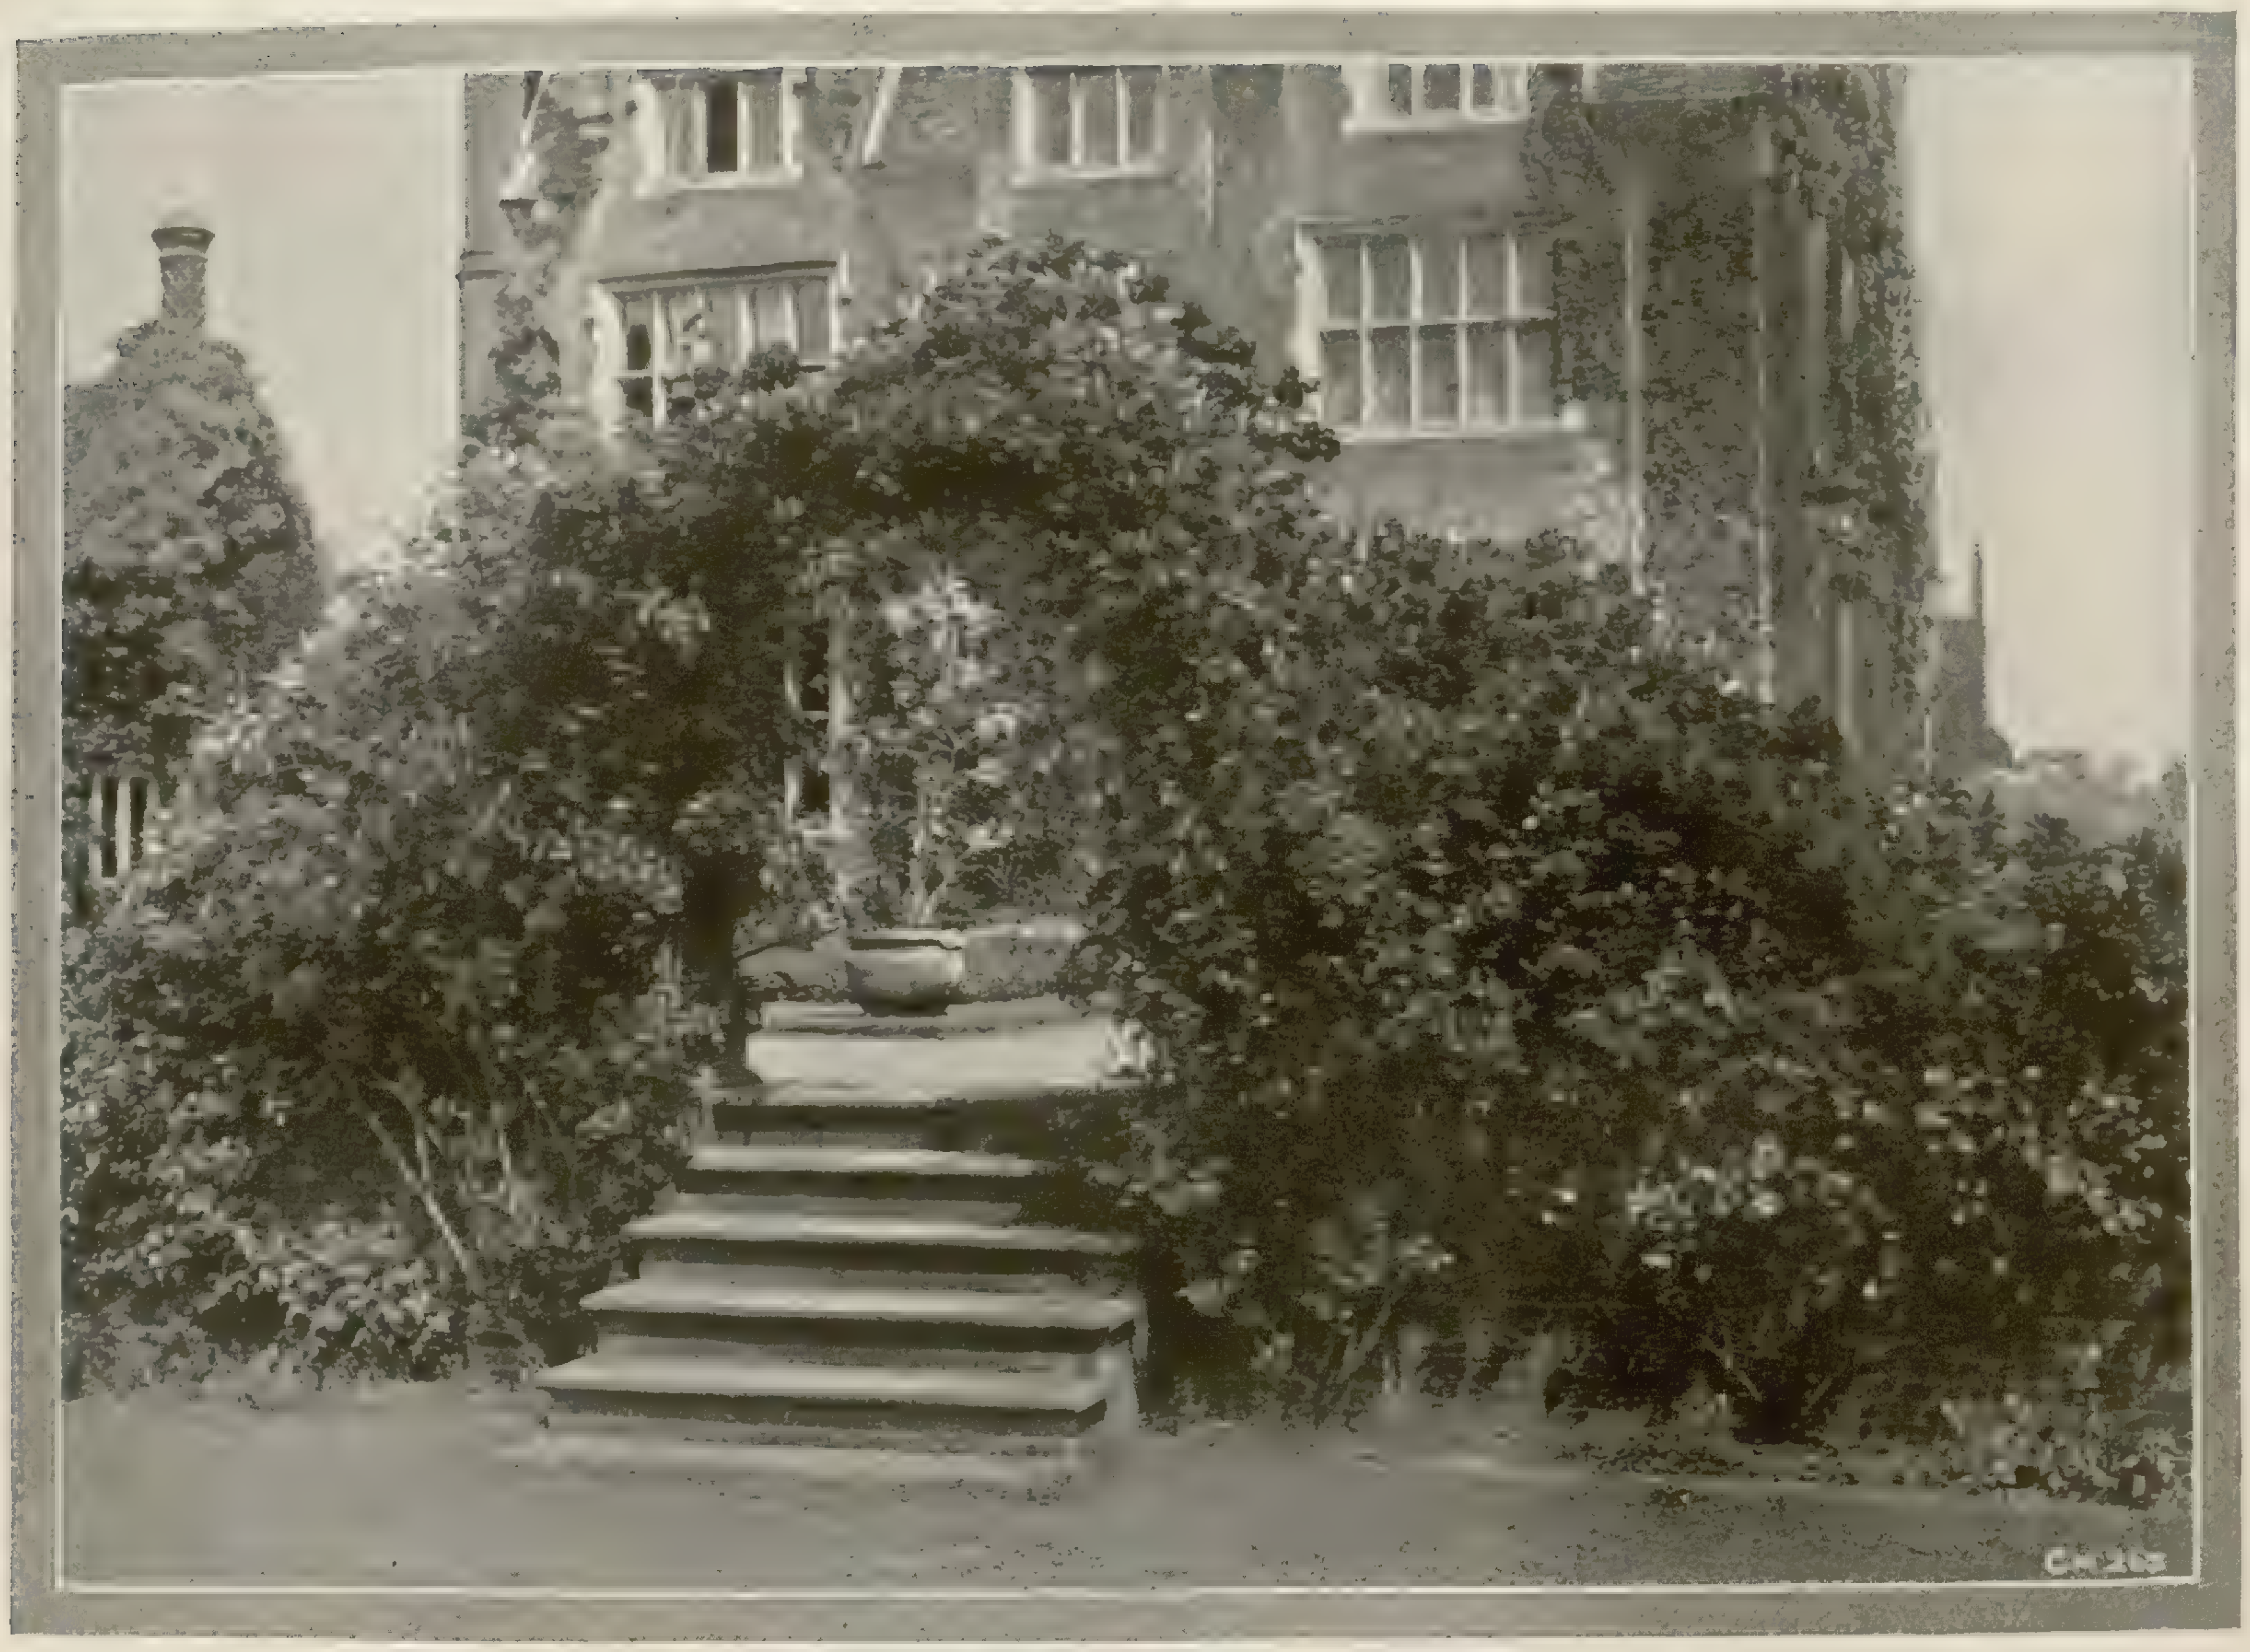
There are many more, and all around us buds of flower and leaf bring that message which is ever full of joy to the gardener's heart.

"Summer is cumen in,
Loud sing cuckoo;
Groweth seed,
And bloweth mead,
And springeth the weed anew—
Sing cuckoo!"

S. ARNOTT.

Forced Bulbs and Cold Frames.—Where many bulbs are forced and then are saved for beautifying the wild garden, they are apt to be a bit of a nuisance just now when frame room is precious; and yet one cannot turn them out direct into the cold world after pampering them up in the greenhouse. An excellent way of economising space in the frames is to turn all the bulbs out of their pots, and, starting at one end of a frame, pack them in as closely as possible giving the soil a good squeeze to fill up chinks. In this way they are quite safe till planting out time arrives, and can be easily watered with a rosed three-gallon can to enable them to finish their growth.—E. J. K.

Galanthus nivalis poculiformis.—A delightful little snowdrop bears this long name, and it must be said that it is worthy of a more attractive one, so beautiful is it in its own simple way. It comes from Galanthus nivalis, the common snowdrop, and has been found in more than one place among other snowdrops. The first one recorded was from that home of snowdrops, Dunrobin Castle, Sutherlandshire, where Mr. D. Melville found it growing. It has also been discovered in a garden near Ayr, and in one or two other places this attractive little flower has been noticed. It is a beautiful snowdrop, owing much of its charm to the fact that the inner segments are of about the same length as the outer, while the green markings are generally absent, giving the blossom a greater purity of appearance. Combined with the formation of the inner petals the effect is charming indeed. Seedlings do not often come true, and, as the plant does not appear to have a very strong constitution, it is not likely to become plentiful.—S. A.



MAGNIFICENT ARCH OF CRIMSON RAMBLER ROSE, DUNSTON HALL.

SOME NORWICH GARDENS.—II.

Dunston Hall.

Some three or four miles to the south of Norwich is Dunston Hall, the charming seat of G. F. Buxton, Esq., which is equally remarkable for its splendid position and attractive gardens. The route from Norwich is much the same as that for Shotesham Park, for some part of the distance, and is, therefore, remarkable for its sylvan beauty. The handsome modern mansion is happily placed on the higher part of the park, and from the broad terrace on which it stands views wide in extent and of great beauty are obtained.

The mansion is approached by a drive flanked by a rather large selection of the finest conifers, which constitute a feature at once interesting and beautiful. The trees, while possessing much of the vigour of youth, are sufficiently advanced to show their distinctive characteristics, and afford the visitor a foretaste of the many charms the gardens possess. There are other fine coniferous trees in other parts of the extensive pleasure ground, and one of the most interesting is the remarkably handsome pine which forms a conspicuous object on the lawn, and is illustrated herewith. Of much interest also are the many beautiful deciduous trees and shrubs that have a place in these gardens, and show by their thriving appearance that the conditions that obtain are most conducive to their welfare.

One of the most charming features of the Dunston Hall gardens is that formed by the roses, which are evidently highly appreciated by Mr. and Mrs. Buxton, and skilfully cultivated by Mr. E. Hewer, the head gardener. The magnificent arch of Crimson Rambler, which spans the entrance to the terrace from the south, was aglow with colour when the photograph was taken, but as the tone values of flowers and foliage is much the same in monochrome it is impossible to differentiate the blossoms from the leaves in the reproduction, excellent as it unquestionably is. The garden tea house, with its clustering roses, is another example of the successful use of rambling varieties, and the structure is an object of considerable beauty in the general scheme, while affording cool, refreshing shade to those who take advantage of the shelter it affords from the summer sun. Contiguous to the kitchen garden is an admirably constructed pergola, of considerable length, clothed exclusively with white roses and clematis, and the beds and borders near thereto are also devoted to white flowers. Within the kitchen garden are many roses, and conspicuous among them was a tall pillar of Helene, one of the finest of the pink ramblers, being strong in growth and free in blooming. Fortune's Yellow rose is also grown with much success. In the kitchen garden also are spacious borders devoted to herbaceous plants, and in these the finest of the kinds are represented, and in such manner as to show their respective characteristics, and to produce a rich and beautiful display of colour.

The glass department is remarkable for its extent and the skill with which the several subjects are grown, and in the interest of our readers should receive a fuller notice than it is now possible to give it. Especially interesting was the big orchard house, in which was a fine crop of The Czar plum and other fruits, and having regard to the aggregate quantity of fruit that is obtained from it there is no difficulty in recognising the great value of such structures in gardens where a large demand for fruit has to be met. In the peach houses were fine crops of peaches and nectarines, and in the vineries there were crops of both mid-season and late grapes, that, by reason of their weight and finish, testified in no uncertain manner to the skill that had been brought to bear upon them.

Crown Point.

This is another of the many good gardens in the neighbourhood of Norwich, and is the largest garden near the City, adjoining the village of Trowse. But a stranger in the garden or park at Crown Point would scarcely imagine the proximity of a great town, as only here and there between the trees can glimpses be seen of the cathedral and the church spires beyond. The place is finely situated on the highest point about Norwich, and from Trowse one sees it as a beautifully wooded hill, with the great mansion embowered in leafage. The estate extends about two miles in an easterly direction on the plateau, but citywards the park descends in a sharp slope to the river Yare, the whole estate being of the characteristic Norfolk scenery, with woods and arable land, where the partridge and pheasant are as important as the chief industry of farming.

Crown Point itself must always have been an important residential place, as one may gather from the extent of ornamental park land, with an abundance of tree growth of several generations. The house itself is a comparatively modern building of some forty or fifty years. It is a stately mansion of red brick and stone of an undecided style of architecture, but with a distinct feeling of Jacobean treatment in its gables and general features. After the house was built it became derelict for many years, and a few years ago it was acquired by Mr. Russell Colman, who made extensive alterations to the house under the direction of Mr. Boardman, the well-known Norwich architect, and is now one of the finest and most up-to-date mansion houses in the country. The grounds also have undergone considerable change, and are still in the transition stage of being remodelled under the direction of Mr. W. Goldring, of Kew. As the place is not finished we shall defer a fuller account of this remarkable garden until a later date, when we are able to show illustrations of the noteworthy features.

So far as the completed work extends, there are stately terraces enclosed by walls ornamented by the beautiful "lacework" pattern of open brickwork peculiar to the neighbourhood of Norwich, as these bricks are made in the famous Costessey brickfields. The same style of ornamental walls are in many Norfolk gardens, such as Blickling, Costessey, and also at Hatfield House, in Hertfordshire and other old places.

GARDEN TEA HOUSE, WITH RAMBLING ROSES, DUNSTON HALL.

Within the terrace walls is a large sunk formal garden, planted with roses chiefly, and the fine examples of Dutch topiary work give character to the enclosure.

Beyond the terrace is a broad grass avenue lined with horse chestnuts, and on each side are the spacious playing lawns for croquet and tennis, which, owing to the nature of the original surface, are in sunk square panels, the surrounding banks being about eighteen inches high, conveniently high for sitting. This unusual feature harmonises well with the scheme of the straight lines leading from the terrace. Beyond these playing lawns formality ceases, and all is irregular, following the natural contour of the ground. The planting is arranged in bold masses of one or only a few kinds of plants, and this style of bold grouping is seen particularly in The Dell, a natural depression, with the steep sloping banks planted with masses of rhododendrons, azaleas, tree pæonies, and other flowering shrubs. This dell has been just planted, but we can imagine the beautiful future effect of this part of the grounds, and even now there is an absence of newness, because of the many fine ornamental trees of forty years' growth surrounding it.

Beyond the dell is an unusual feature, this being an open-air theatre for pastoral plays, a replica, we understand, of one in a famous Italian garden. The stage, and the sloping auditorium, are symmetrically treated, and the whole is surrounded with evergreen clipped hedges. Around the theatre is an open part studded with trees, where Mrs. Colman has her broad effects of spring colour from bulbs, primroses, anemones, and other early spring things, and this is carried out in the same spacious way as the other parts. Then comes the park, in which the picturesque herd of Highland cattle range as happy as in their Scottish home.

On the east side of the house is a huge conservatory, one of the finest we have seen adjoining a residence. Its great height affords opportunity for draping the columns and roof with the finest greenhouse climbers, and such as Solanum jasminoides, tacsonias, and variegated cobæas are twenty or thirty feet in height. The back wall is covered with maidenhair ferns and Asparagus plumosus, among which intertwine in summer the lovely turquoise-blue of the Ipomæa purpureo-cærulea. The floor space, of marble, is unencumbered by beds or stages, as the place is used as a lounge, but here and there are large groups of pot plants, changed as they go out of bloom, surrounding tall palms and tree ferns.

Beyond the conservatory is the spring garden, enclosed on one side by yew hedges and ivy-clad wall, a pergola, and rocky bank. This garden is chiefly planted with early-flowering shrubs of the choicer kinds that come into bloom early. Masses of cydonias will now soon give a brightness, followed by azaleas and heaths.

A walk leading from the spring garden, past a spacious water pool, and through a newly-constructed pergola, with massive brick piers, brings us to the kitchen garden, in area of about two acres, enclosed by fruit-tree walls on two sides, on another side by an open ornamental creeper-clad fence, with piers. The other side will eventually be taken up by the glass houses, half of which are completed. The whole range will be about eighty yards long, and throughout the length there will be a wide corridor connecting the structures, which comprise the usual vineries, peach houses, and plant houses. These latter are span-roofed structures, and stand at right angles to the back wall, so as to command the maximum of sun and air, and are, moreover, not too large or high, being just the kind of house a gardener can grow any kind of stove or greenhouse plants so as to do him justice.

Outside the kitchen garden is a broad herbaceous plant border a hundred yards long, with masses of roses and irises, and rose hedges dividing it from the orchard.

The peculiar feature about Crown Point is that the garden is planted chiefly for spring and early summer effects, for after these are over there is the annual migration to Mr. Colman's beautiful place, Corton, on the coast, which is planted for late summer and autumn effects.

The thorough way that everything in connection with the garden has been carried out, the consideration given to the garden buildings, the gardener's house, the comfortable bothy, and other matters mark this as one of the best-appointed gardens we have seen, and Mr. Watson, the gardener, has reason to appreciate, as he does, the satisfaction of having to deal with up-to-date appliances for cultivation.

Town Close House.

As Town Close House, the residence of E. T. Boardman, Esq., is within a very short distance of the city boundary, the visitor will not expect to find gardens and pleasure grounds with so large an area as those of big seats in country districts. He may err on the other side in supposing that the gardens would be considerably smaller than is really the case, and he must certainly possess remarkable powers of imagination who is able to fully anticipate the many charms they possess. What the area is we are unable to say, but there is a wide expanse of finely-kept turf, a delightful rose garden, an extensive flower garden, and many fine trees.

If the gardens are less than those of some of the big country seats, less than those of Mr. Boardman's residence in the country, at How Hill, they are so distinct in their several features, so surpassingly beautiful, and, moreover, so high in their keeping, that it would be impossible to find gardens from which a greater amount of interest and enjoyment could be obtained. The wide-spreading lawn extends round three sides of the mansion, and, as will be seen from a glance at the illustrations, contains a considerable number of splendidly developed trees. The green and purple-leaved beeches are particularly fine, but the most notable example of arborescent vegetation is the magnificent Snowdrop Tree (Halesia tetraptera), of Virginia, which is exquisitely beautiful when bearing its precious burden of pure white snow-drop-like flowers. This halesia is historic, as it is said to be, and no doubt is, the finest tree of the species in Europe. At three feet from the ground it has a girth of six feet seven inches; the total spread of branches in one direction is sixty-six feet, and in another sixty-one feet. There is no doubt the spread would have been a uniform distance of from thirty to thirty-three feet from the trunk had not a tulip tree overshadowed one side. The age of the tree is not exactly known, but the following note about it is an extract from Grigor's book called "The Eastern Arboretum," published in 1840. Grigor states that "This Snowdrop Tree is twenty-nine feet high, with a trunk four feet in circumference, and the diameter of its spread of branches is thirty-three feet. I think it is the largest specimen of Snowdrop Tree in England. It stands in the grounds of a villa called the Town Close. Beside it stands a Tulip Tree six and a-half feet in circumference and fifty-feet high." To show that Town Close was remarkable at the date of Grigor's account of it, we would mention that he goes on to say in florid language, "The great charm of this heavenly retreat, is a shaded walk of beech, a verdant arcade ninety yards in length, forming a promenade almost unequalled except in fiction, and looks like a relic of fairy land." Crocuses and other spring-flowering subjects thrive in the grass, and as they were in the first place planted in large numbers, the effect produced when the lawn is bedecked with their flowers is surpassingly beautiful.

On the far side of the lawn is a geometric flower garden, of which an illustration is herewith given, and the group of beds has for a centre-piece the finely developed weeping rose illustrated in the GARDENERS' MAGAZINE of March 7. Some distance to the left is the rose garden, which is enclosed with shrubs of low growth to prevent undue prominence when the roses are not in bloom, and in the centre is an elegant sun-dial. The beds are filled with dwarf bushes of the several sections, and round the boundary are some of the finest of the rambling varieties that have attained to a high degree of development. The border of hardy herbaceous plants contributes its attractions to the garden, and affords plentiful supplies of flowers throughout the season. One of the most charming features of the garden is perhaps the terrace, supported by a low wall, herewith illustrated. The face of the wall is clothed with cotoneasters and other shrubs of low growth; at the foot is a narrow border, which last summer was filled with ivy-leaf pelargoniums bearing rose-pink flowers; along the garden side of the terrace is a narrow border filled with dwarf roses, and over the wall on the other side rambling roses fling their flower-laden branches in great profusion. A more charming effect than is produced by this happy combination it would be difficult to imagine.

AUSTRIAN PINE (PINUS LARICIO) IN TERRACE GARDEN, DUNSTON HALL.

On the other side of the wall is the kitchen garden, which, it would be superfluous to say, is admirably managed, but it may be said that there are some charming arches of roses, one of the most attractive at the time when we had the pleasure of visiting the gardens being that over which ~~the Crimson and Dundee Ramblers~~ were striving for mastery in flower production.

Ashwellthorpe Hall.

Ashwellthorpe Hall, the country residence of the Baroness Berners, is an Elizabethan mansion that has been somewhat modernised, and is situate in a retired situation some nine miles to the south-west of Norwich. Partly surrounded by a moat, and embosomed in many stately trees, this ancient seat of the Thorpe, Bourchier, Knyvett, and Berners families takes us back many centuries, indeed to the times when statements as to miraculous occurrences were accepted without question by the popular mind. In this case, according to the legendary ballad which is given at length by Blomfield in his history of Norfolk, the hall was the scene of a remarkable occurrence during the life of Sir Thomas Knyvett, who was "much beloved for his hospitality and good nature, and died in 1616." A stranger, according to tradition, presented himself at Ashwellthorpe at Christmas, and after showing the company an acorn, set it down in the middle of the hall. Immediately an oak tree sprung up, and grew so rapidly that the hall was soon filled by its branches. A crop of acorns quickly followed, and these having fell on the floor, two men, "stout and strong," came in and cut it down. The felled tree could not be moved until a pair of goslings appeared, and drew it away without leaving a trace of even acorns or chips behind. It has been suggested by some of the authorities that the tradition originated from a magic lantern display, but this could hardly have been the case, as the magic lantern was not invented until the seventeenth century was well advanced. It could, of course, have been due to an optical illusion, for lenses and prisms were made in the fourteenth century, there is room for doubt upon this point.

The gardens of Ashwellthorpe Hall, although having a considerable area, are remarkable more for their beauty and interest than for their extent. To visit them once is to wish to see them again, and the impression that remains after a walk round them in company with Mr. T. B. Field is the possibility of obtaining abiding and delightful effects by comparatively simple means when good taste and judgment are allowed to pursue their proper course. There is no straining after startling effect, but a quiet order and beauty has been established, telling its own story of refined taste for what is best in English gardening.

The grounds are entered by a sheltered drive, where in spring a wealth of woodland flowers have their home. The place is a veritable paradise for birds, and many of the most interesting of feathered songsters have their home within the grounds. To the right is a retired rose garden, in which may be found some of the most beautiful of the species and many of the finest varieties in the best possible condition, and yielding a wealth of bloom during the summer months. Passing to the rear of the house, and crossing the moat, the visitor enters the spacious walled gardens, and it is here that many characteristic features of Ashwellthorpe are in evidence. In addition to the usual crops of vegetables, which bear the impress of the skilled cultivator, are many interesting plants that have been gathered by Mr. Field from various quarters. The colonies of hardy cypripediums and Christmas roses are especially remarkble for their size and the vigour of the plants, and constitute features that appeal strongly to those who derive additional enjoyment from successfully cultivated examples of plants not commonly met with.

The rose, however, has pride of place at Ashwellthorpe, and very liberally does it contribute to its many attractions. The soil and climatic conditions are, as in other gardens round Norwich, favourable to the growth of roses, and under the skilful management of Mr. Field they attain to a high degree of development. Magnificent specimens of Fortune's Yellow, Crimson Rambler, Gardenia, and other climbers may be seen on the walls, arches, and other forms of support, while in beds and borders are dwarfs and standards in so rude a state of health as to enable them to produce an abundance of flowers. Narcissi contribute materially to the attractions of the gardens in spring, for in addition to those which have a place in formal beds and borders, hosts have a place in the home meadows stretching out beyond the immediate garden. Violets in the finer varieties are largely and especially well grown, and yield a wealth of their fragrant blossoms throughout the season.

To reach the front of the mansion one passes along a grass walk of generous width, bounded on the far side by a hedge of purple beech, so remarkable as to suggest that it is the finest hedge of its kind in the country. The length is 130 yards, the height seven feet, and the keeping of the best. Hereabouts are borders of choice flowering trees and shrubs, and fine specimens of many of the best of the ornamental trees, and borders filled to repletion with the best of the hardy herbaceous plants, in which are groups of stately irises, pæonies, etc., while lilies and foxgloves make a fine feature on the fringe of the woods from the bold simplicity of their grouping.

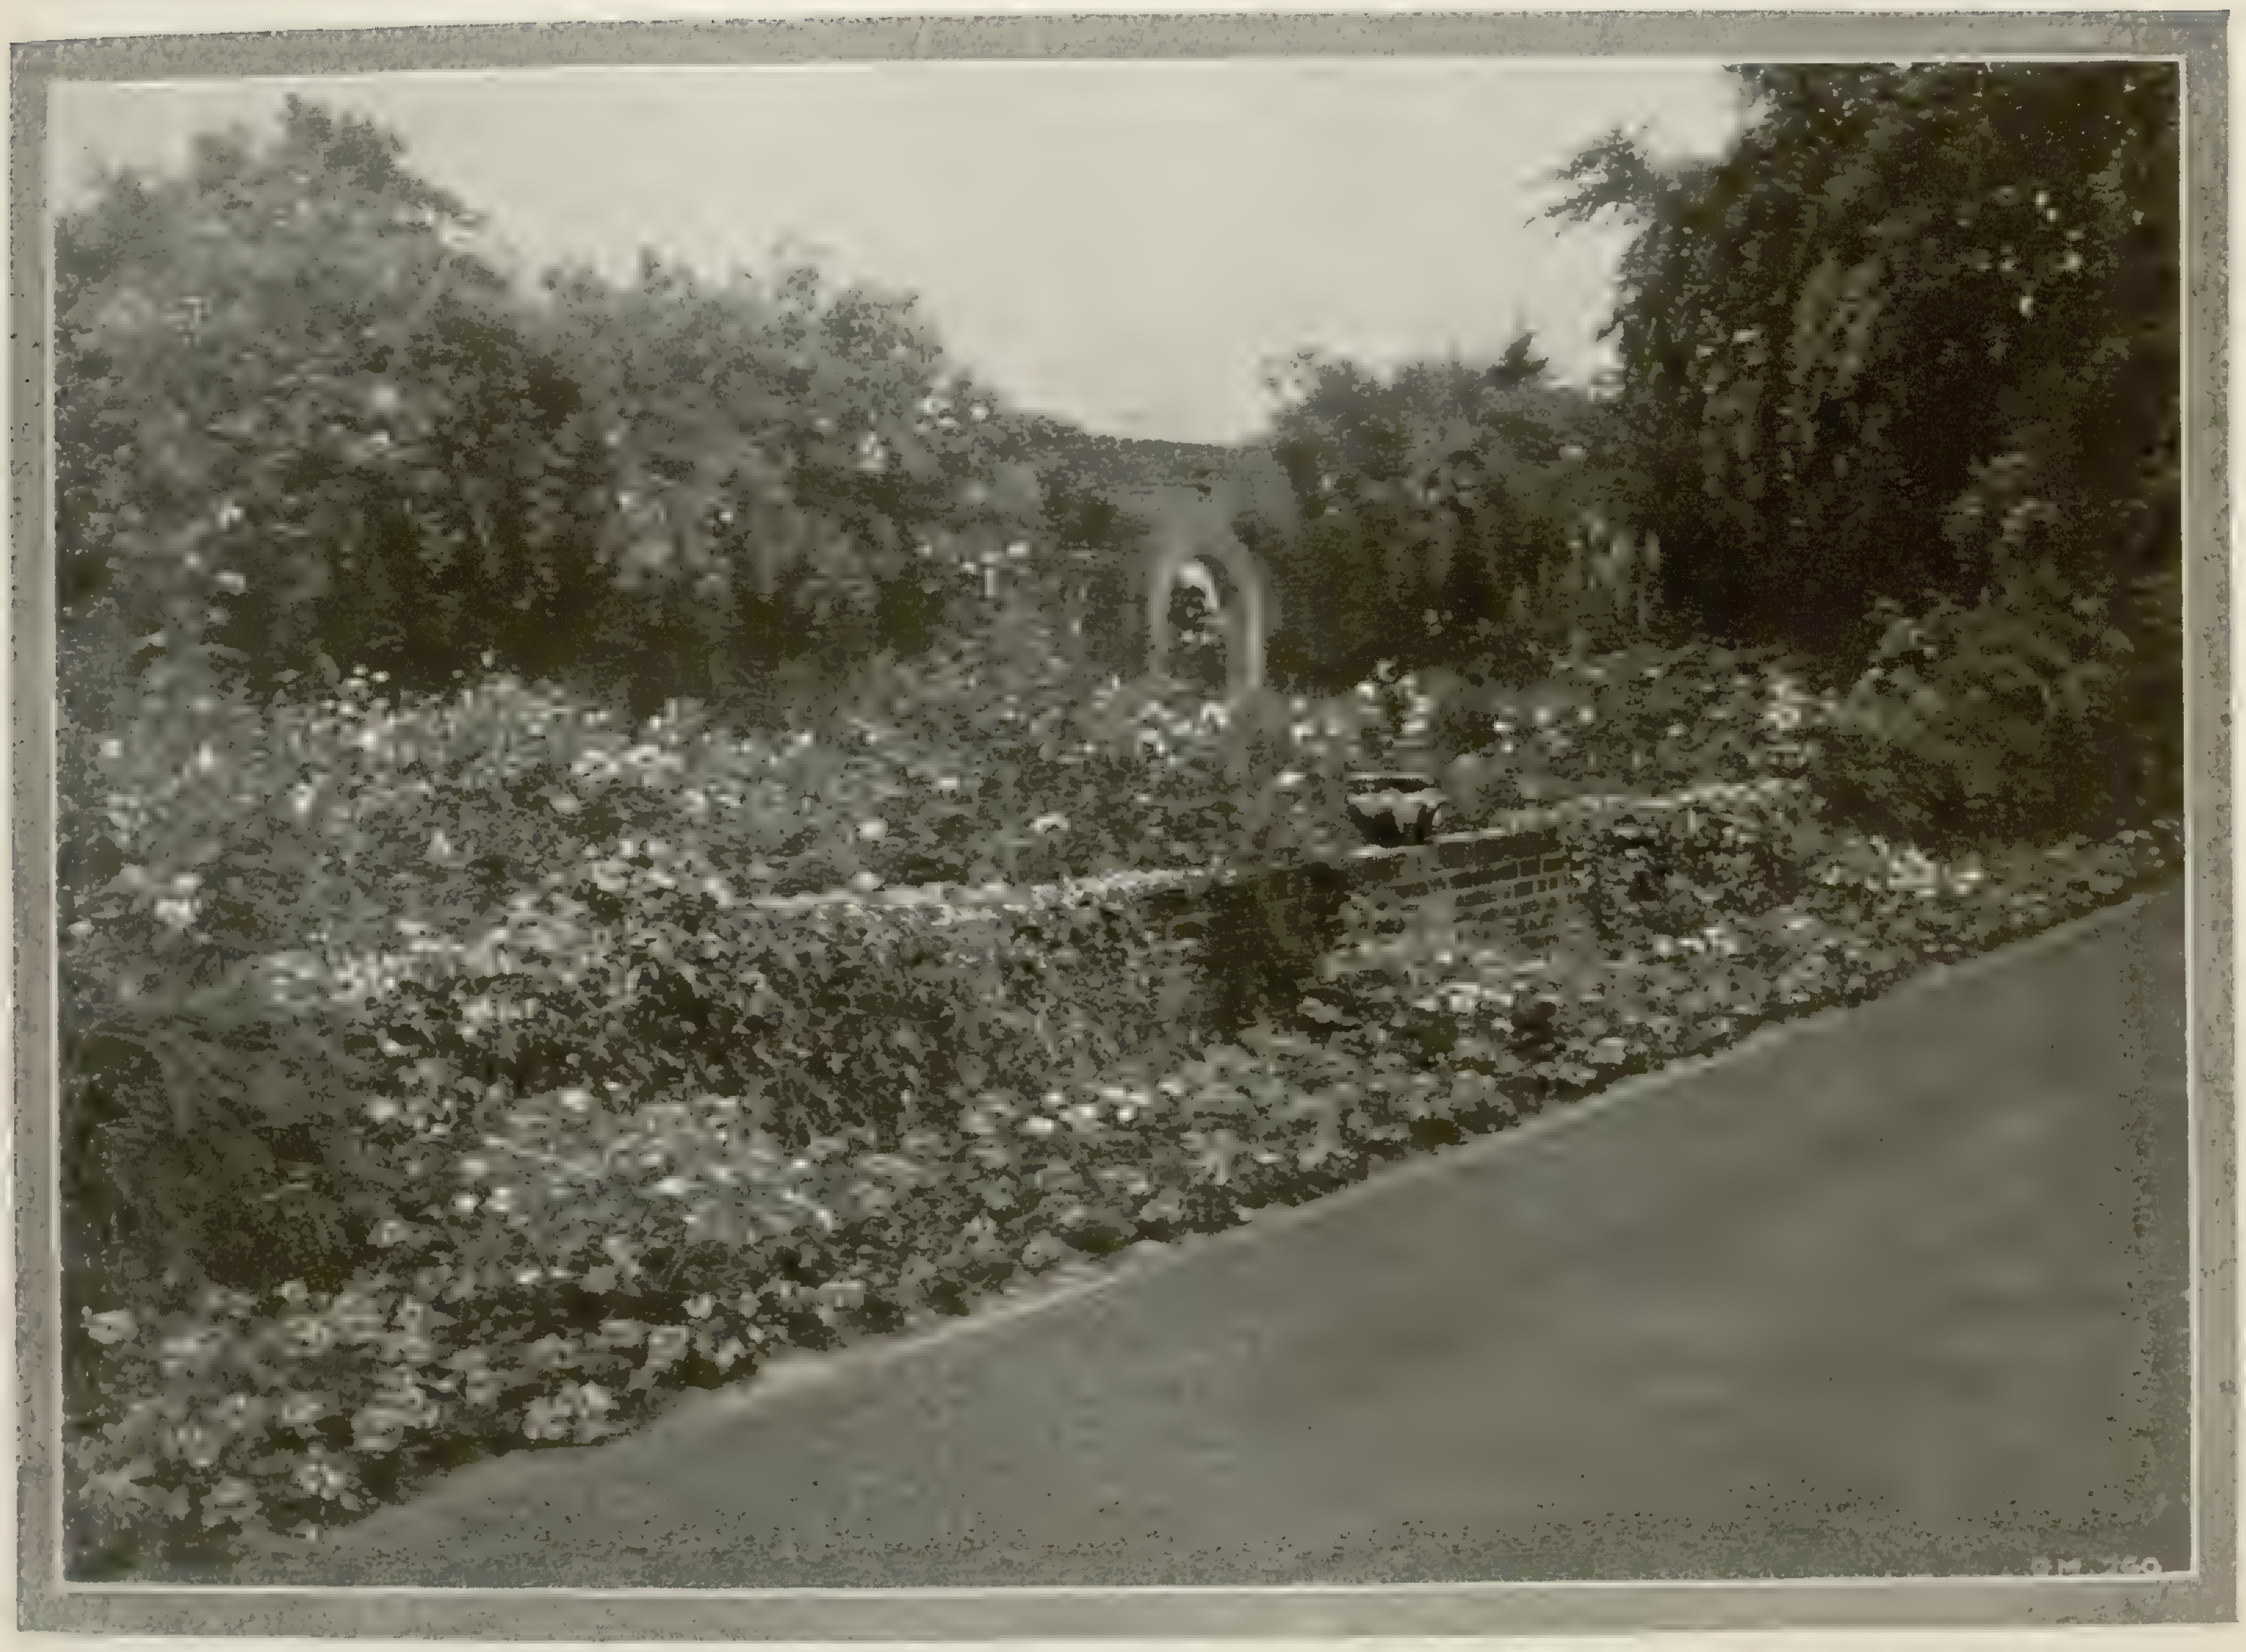
It should be added that, apart from the splendid work he has accomplished in the beautiful gardens under his charge, Mr. Field has rendered service of immense value in the district by his sympathy with and advice on horticultural education. He is acting vice-president of the East Anglian Horticultural Club, and a member of the committee of the Norwich Museum Association, which is doing useful work in connection with the extension of a knowledge of economic entomolgy.

Oakland House, Cringleford.

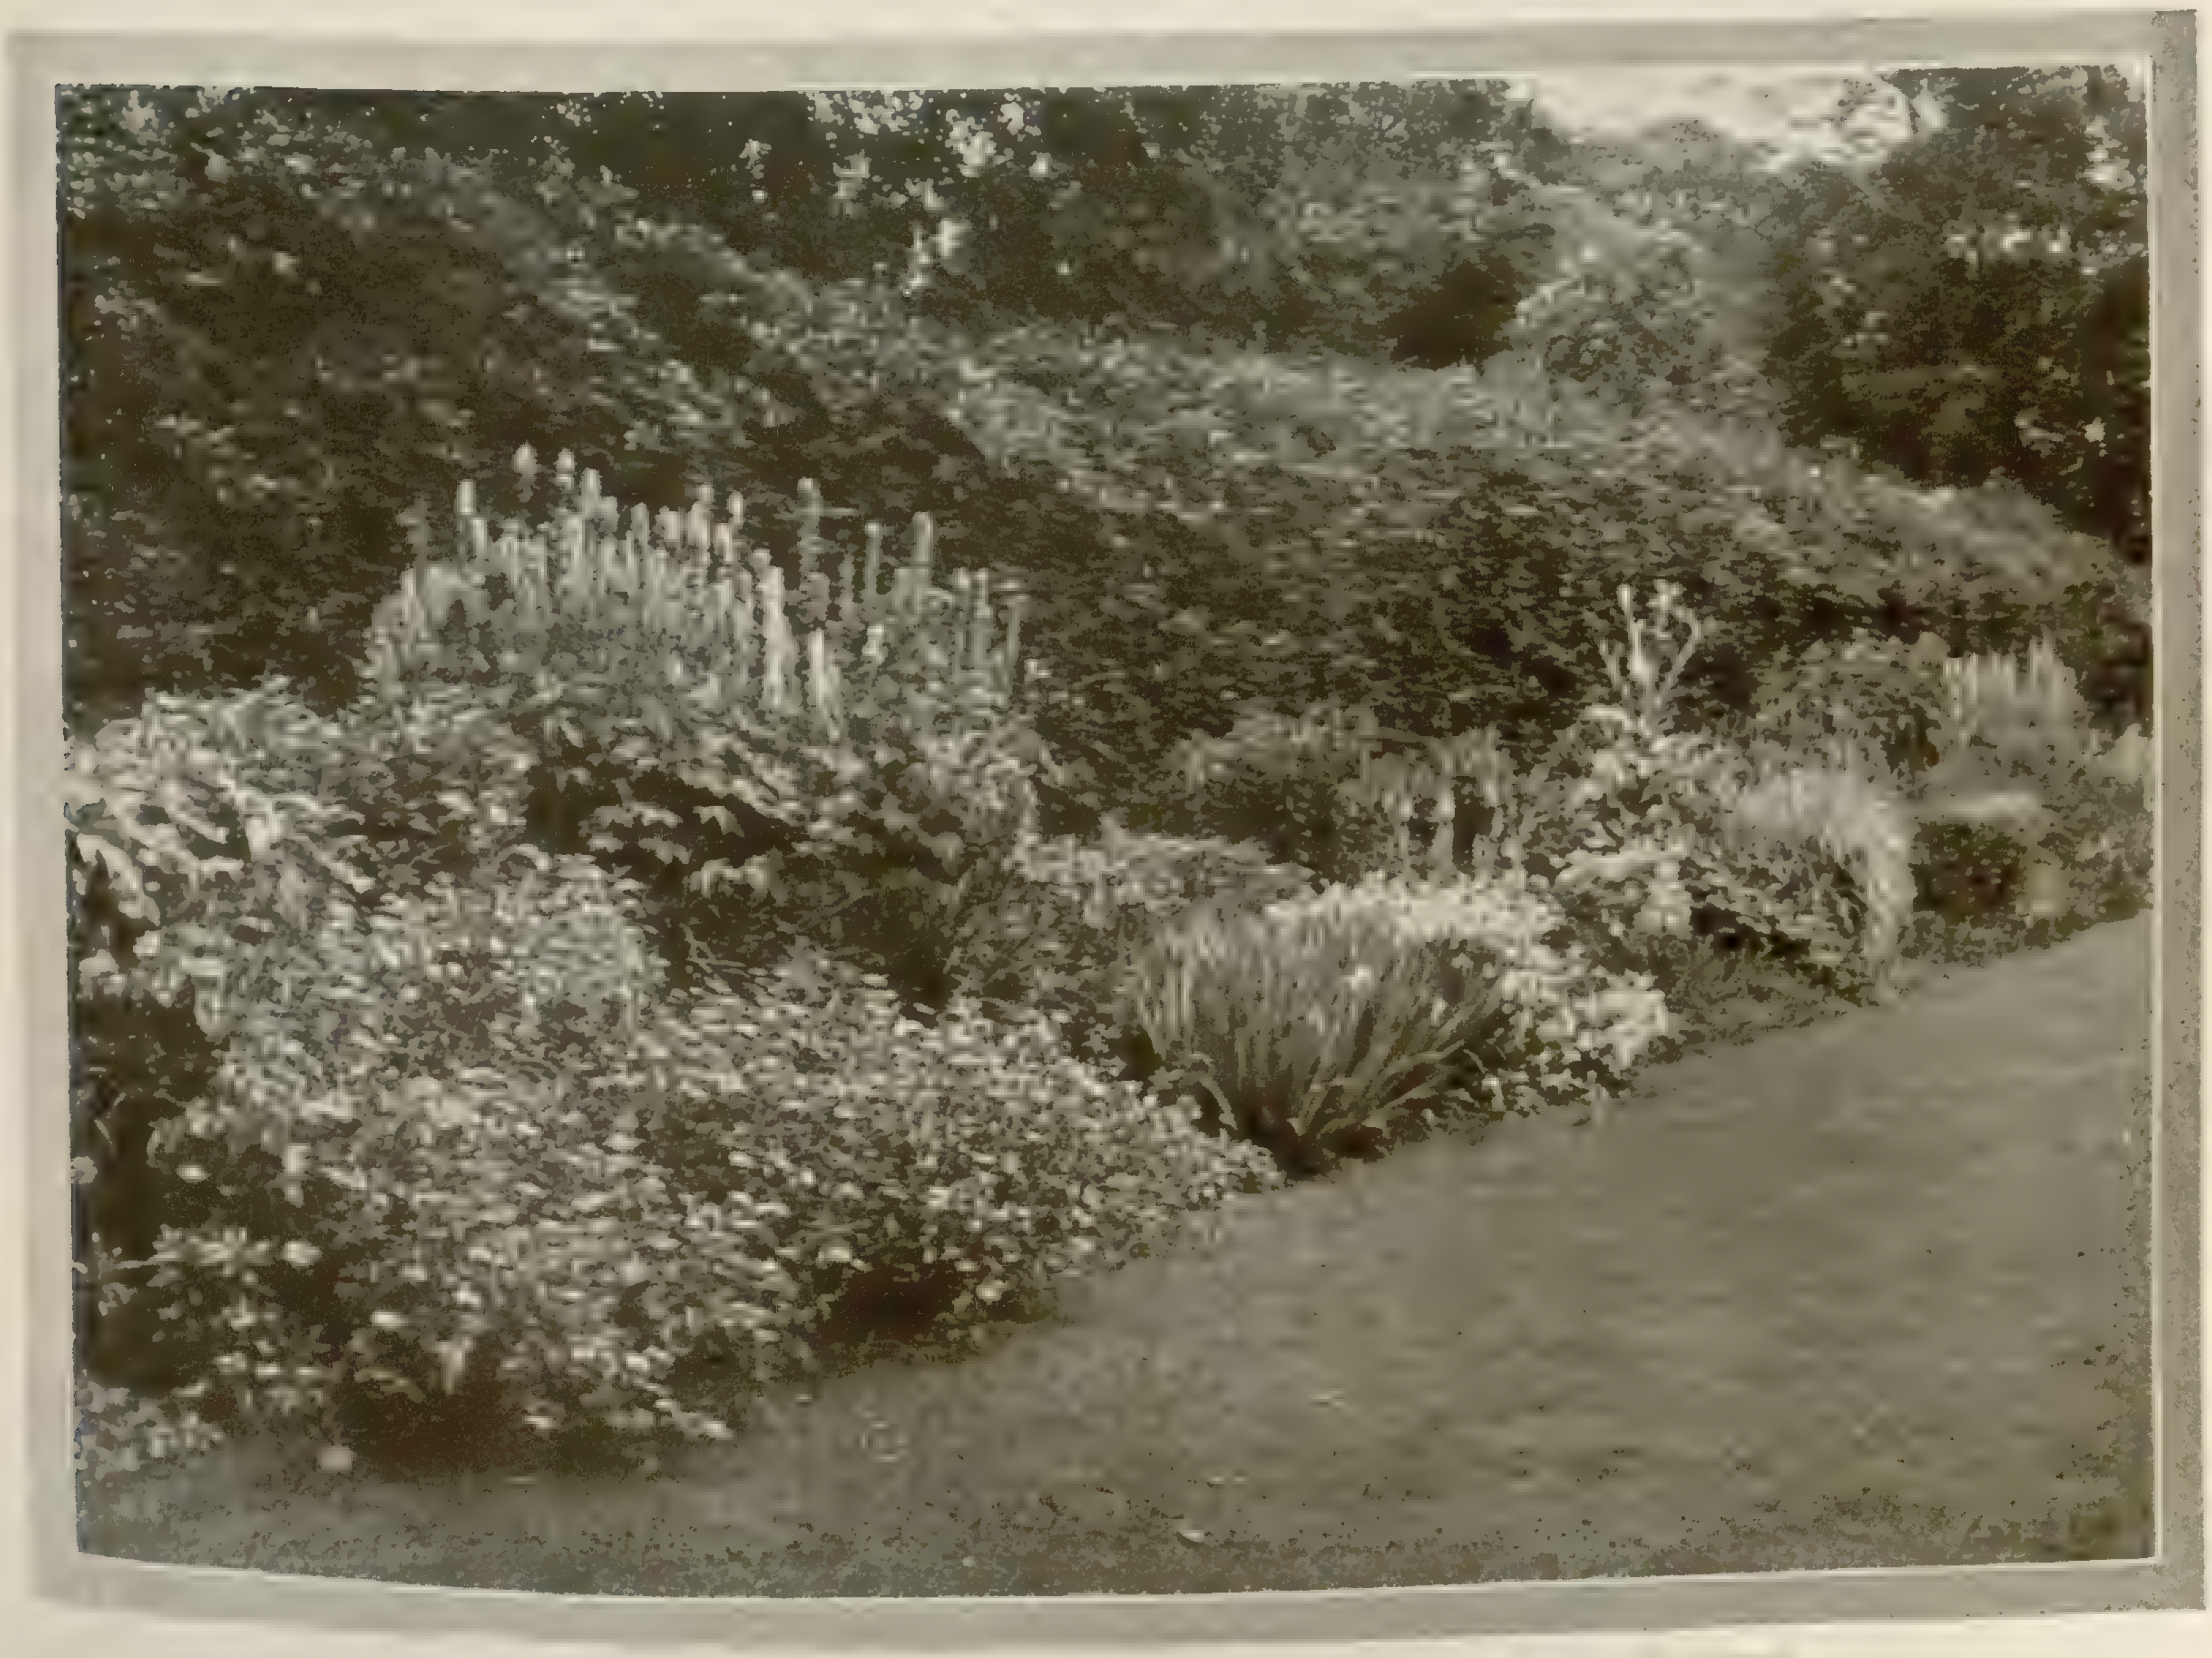
Within a short distance of the quaint village of Cringleford, and some three miles distant from Norwich, is Oakland House, the residence of F. H. Harmer, Esq., who a few years since was president of the Norfolk and Norwich Horticultural Society, and has in various other ways given practical proof of his great interest in all that relates to the advancement of horticulture. The house occupies a well-chosen position on high ground, and commands views of great beauty over the valley of the river Yare, which flows through the estate and along the southern boundary of the pleasure grounds, and contributes its quota to the manifold charms which the garden possesses.

The grounds are extensive, pleasantly undulating, richly furnished with trees and shrubs, and freely embellished with hardy and other flowering plants and roses, all of which grow in a manner that proves proper provisions were made for them previous to planting, and that they have had skilled attention since they became established. On the walk that proceeds from the house and through the grounds in a southerly direction there is, on one side, a long border of considerable breadth devoted to China roses, and on the other a border of herbaceous plants, which here, as elsewhere, are regarded as essential to the proper furnishing of the garden. The roses show by their ample foliage and abundance of flowers that the conditions under which they have been placed are favourable to their full development, and when we had the pleasure of visiting Oakland House they suggested they might with advantage be more freely

GEOMETRIC FLOWER GARDEN, TOWN CLOSE HOUSE.



TERRACE WITH DWARF AND RAMBLING ROSES, AND IVY-LEAF PELARGONIUMS, TOWN CLOSE HOUSE.



BORDER OF HARDY PERENNIALS, TOWN CLOSE HOUSE.

utilised in furnishing pleasure grounds than as yet has been the case. From early in the summer until late in the autumn they bloom freely and continuously, and if the selection is carefully made they afford a considerable range of colour. At the back of the roses is a long belt of shrubs, comprising many of the finest kinds available for the planter, and this, while contributing materially to the general effect, possesses much that is of interest, and affords many useful object lessons.

The dressed grounds, with their beds and borders of roses and flowering plants, their fine groups of shrubs and splendidly developed choice trees, are spacious and rich in interest and beauty; but they are by no means the only attractions the gardens possess. Mr. Harmer, who takes a keen interest in his charming gardens, and is well acquainted with the many and diverse forms of vegetation they contain, has devoted considerable attention to both rock and water gardening. In developing these features he has shown a full appreciation of environment, and as the result the rockery and the water garden are both placed amid suitable surroundings. To reach the alpine garden one has to cross the meadow to the right of the herbaceous border to a large enclosure bordering on a wood, and on passing the gateway, and having a glance at the plants that clothe the ledges and slopes, it might be readily imagined that the garden had been designed and planted by Nature, instead of being the work of man. Naturally, the area had an irregular surface, with sloping banks, and in its conversion into a home for alpines an endeavour was evidently made, and with much success, to conceal the work that had been done in providing suitable sites for the plants. It would be interesting to give the names of the noteworthy kinds that are flourishing on the slopes and ledges, and in the hollows, but they would, by reason of their numbers, require too much space to admit of this being done.

The wild garden is not less interesting and attractive in its way than is that devoted to rock or alpine plants, and is noteworthy for the judgment shown in taking advantage of a site specially adapted to the requirements of the plants of most value for this form of gardening. Some distance from the rock garden, and so low as to be nearly on a level with the river, is a large wood, in which are numerous canals that are at all times filled with water. There are also numerous green drives in the wood, and in the open spaces that existed, or have been made alongside the drives and elsewhere, moisture-loving plants of various kinds have been planted. The canals are fringed with ferns and flowering plants in delightful profusion, and alongside the green glades are bold and handsome groups of various kinds. Especially noteworthy are those in which the gaily-coloured swamp lily is conspicuous and the great masses of the ostrich fern which is seldom seen in so luxuriant a condition.

Contiguous to the wood, but quite beyond the influence of the shade of the trees, is the water lily canal, which is quite unique in its way. This is simply a backwater from the river, and in threading its way across the open meadow it affords the best possible opportunity for the cultivation of a collection of the finest of the nymphæas, and this has been taken full advantage of by Mr. Harmer and his highly skilful gardener, Mr. Shoesmith.

Boyland Hall.

Boyland Hall, the charming residence of Colonel Irby, is a large and handsome mansion, which, with its extensive pleasure grounds, is situate in a wide-spreading park, and is about one and a-half miles north-west of the village of Morningthorpe, and about ten miles south of Norwich. The mansion is in the Elizabethan style, and was built in the year 1551, and is surrounded by extensive pleasure grounds, remarkable for the width of turf and for the well-planned and richly-furnished borders and groups of shrubs. From the garden front of the mansion the wide expanse of close-shaven turf stretches away into the distance, and to the eye suggests space well-nigh illimitable. To the right and left of this magnificent lawn are fine belts of trees, in which are oaks and beeches of exceptional magnitude, and in suitable positions are groups of rhododendrons in the best of health that give, in their season of flowering, a wealth of colour, and at all times contribute liberally to the charm of the scenery of which they form part. Here also are numerous flower beds of large size, and invariably furnished with much taste.

The dominant feature of the flower garden is unquestionably formed by the admirably stocked borders of hardy herbaceous plants, and the profusion of garden roses. These latter have been planted in large numbers, and, having their cultural requirements attended to with exceptional skill, they grow with great vigour and produce finely developed blooms in the most profuse manner. A border that extends from the gardener's cottage to the kitchen garden, about one-third of a mile distant, is wholly devoted to hardy perennials of the choicest description and rambling roses, and when it is said that both classes of subjects are grown to a high degree of perfection it will not be difficult for the reader to realise the delightful effects that are produced in the course of the summer as the various subjects yield of their wealth of floral beauty.

In the fine old kitchen garden of Boyland Hall there is much to interest, for

BORDERS OF CHINA ROSES AND HARDY HERBACEOUS PLANTS, OAKLAND HOUSE.

Mr. Andrew, the head gardener, is fully acquainted with all that tends to good results in the cultivation of both fruits and vegetables. Here we find large breadths of vegetables in general use in the finest possible condition, and the enclosing walls clothed with finely-grown fruit trees of all the most useful kinds. The kitchen garden is not wholly given up to vegetables, for on either side of the main walk, by which the garden is intersected, are broad borders of hardy herbaceous plants that are not less flourishing than are those in the ornamental grounds. Some of the side borders also are devoted to hardy flowers, and in the kitchen garden also carnations are grown extensively, and with much success. The plant and fruit houses are numerous and well equipped, and, as is the case in other departments, afford unmistakable evidence of cultural skill and high keeping.

It can hardly fail to be of interest to mention that on a plot of land adjoining the kitchen garden potatoes for the use of the house have been grown without intermission for forty years, and with the best results. Indeed, Mr. Andrew states that the crop lifted last year was quite equal to the first crop taken up forty years ago. As the continuous cultivation of potatoes on the same ground for any length of time is opposed to the views that obtain amongst the most successful cultivators, the principal points in Mr. Andrew's practice can hardly fail to be of interest. The ground is deeply trenched every second year, and the refuse from the lawn and garden is burnt, and the ashes and charred material scattered over the surface previous to digging or trenching.

Both Colonel and Mrs. Irby are very fond of their delightful gardens, and the splendid success in their management is largely due to the encouragement received by Mr. Andrew from his employers.

George Gordon.

THE VALUE OF MULCHING TO VEGETABLE CROPS.

During the summer months, in the majority of private gardens, when growth is very active, there is a great strain upon the gardener, and his too often inadequate staff. The question has to be considered by him as to how he can use his men to the best possible advantage. If anything can be done to reduce labour and allay anxiety it is of the utmost importance, as each hour saved can be given to pressing matters that present themselves each day.

In the matter of mulching growing crops, as in most things, common sense has to be called in by taking into consideration the position of the garden and the nature of its soil. Where it stands high, and the soil is of a light character, much time can be saved in watering by giving a timely mulching to many plants, such as the moisture-loving crops of peas, celery, dwarf beans, spinach, lettuce, etc., as it conserves the moisture in the soil, and creates a healthy surface root action that is of the fullest value in promoting a vigorous natural growth. In this class of land, should the weather become hot and dry, it has a steadying effect upon the plants, and to a great extent prevents premature maturity. When watering is resorted to it should be thorough and the water reach well down in the soil. The mulch will then check evaporation, and retain the moisture over as long a time as possible.

The material used should also depend upon the nature of the ground. If light, a dressing of about two inches of well-decayed manure would be of the greatest benefit. I have been particularly struck with the value of peat moss litter as a top-dressing to crops; it seems to absorb and retain manurial properties to a great degree, and where applied it has a marked effect; the only objection is that if used to any great extent on light soil, it has a tendency to lighten it more. On heavy ground it is a first-class material for mulching, as well as being a valuable fertiliser without the above drawback. Grass from the lawn mowings acts beneficially as a surface dressing during dry weather, but, of course, has little manurial value. The short grass is quickly applied, and quite worth using.

With low-lying and adhesive soils there is not the need for such an early application of mulching. This kind of ground will be of lower temperature, and more retentive of moisture, so that frequent surface movement by lightly hoeing or forking will be of more advantage until the sun has stronger power, when a mulch should be applied as in the case of the lighter soils. The labour it will entail will be abundantly repaid if the rainfall is light, and the growth of the crop will be of a more satisfactory nature. Strawy manure as it is received from the stables is suitable for the larger and rougher kinds of vegetables if there is a scarcity of other materials, but too much of this does not add to the good appearance of the garden, and on this account it should be used with judgment in the most frequented parts.

For most soils my experience is that nothing surpasses a top-dressing of good cow and horse manure that has been well rotted down and not allowed to heat unduly. Where horses are bedded down with either bracken fern or sawdust I always avoid using the manure for kitchen garden purposes, as I find the roots, in many cases, where they come into contact with the fern and sawdust in the soil, die back, and in others they show an unhealthy colour. I cannot give the reason for this effect, but the facts are as they have appeared.

Cholmondely Castle Gardens.

HORTICULTURE AND SMALL HOLDINGS.

What effect will the establishment of small holdings have on the horticulture of the country? To this question time alone can supply the answer, and at the present moment opinions are varied regarding the success of the movement. Some people say that it is all a mere fad of a Cabinet Minister, and is sure to fail, while others can see, or think they can see, in small holdings a means of getting the people back to the land, and keeping them there. With these opposite opinions this article has nothing to do, but the future of small holdings is a fitting subject for discussion in the Gardeners' Magazine, considering that horticulture must in many districts be closely associated with them. If I may be allowed to digress for a moment, I fail to see why such a line of distinction should exist between the sister crafts of agriculture and horticulture. The interests of gardener and farmer are in many ways identical, and though their methods differ they are governed by the same principles. To say which was the hardest craft to master might lead to discussion, but the fact

WATER LILY CANAL, OAKLAND HOUSE.

remains that there are numerous cases of gardeners developing into and making good farmers, but the instances in which farmers are also good gardeners are by no means common. Be this as it may, however, it is well within the bounds of probability that small holdings will be a means of knitting the occupations of gardener and farmer more closely together than they have ever been before.

There can be no two opinions about one thing, i.e., the demand for small holdings, and County Council committees are now busy arranging meetings and making inquiries into the applications of would-be small holders. A year or more must necessarily elapse before successful applicants can be put on the land, because there are many preliminaries to be settled, but, in the meantime, the task of the authorities who have to administer the Act is not altogether an enviable one for various reasons. In the first place, would-be small holders are composed of all sorts and conditions of men, and the thing is to select the right ones. There is no question of back to the land at present, because there are more applicants for small holdings already on the land than will get their needs supplied, and in some cases the kindest thing that the authorities can do is to refuse.

Most of us remember the establishment of Parish and District Councils, when power was given to these bodies to acquire land for allotments. The demand for allotments then was something like that for small holdings now, but allotments did not keep people on the land. And in a few villages, alas! they are now veritable white elephants, being derelict and uncultivated, or merged again into the farm from whence they came. Why this failure? In many cases because, in the first place, the stability and qualifications of would-be allotment holders were not looked into; plots were let to any Tom, Dick, or Harry who cared to apply for them, and, after starting with a big flourish of trumpets, they found that allotment culture meant hard work, back-aching any sweat-losing, and they fainted by the way when the novelty of the thing had worn off.

With small holdings the situation is more serious, there is a great deal more at stake, and the responsibility of weeding out the applicants, selecting the right men, and rejecting the undesirables is great. Some would-be small holders have peculiar ideas about the acquirement of land, and have set their hearts on the best bits in the occupation of someone else, without considering the matter from the point of view of the present occupier, while one enthusiast told me the other day that he wished the authorities would hurry up, or he would be too late to put in the crops he intended to grow this season. Yes, indeed, there is a good deal of human nature to be observed amongst the applicants for small holdings.

Market gardening, vegetable and flower culture, naturally suggest themselves as one of the branches that the future small holder will take up, but market gardening is not going to answer everywhere. It is a business that has to be learnt, the competition in it is already keen, there are the products of the foreigner to contend with, and, lastly, to make it pay one must grow the best produce. There are districts in which market gardening presents possibilities for the small holder, and in those districts small holders already exist in fairly large numbers. Take that favoured locality known as the Evesham Vale. It is already a land of small holders, who work their little tenements and have built up within recent years an industry of size and importance. In short, Nature must be allowed to indicate the districts in which horticulture can be successfully included in the arrangements of the small holder, and there must also be considered the proximity to market, and means of disposing of produce. To state a case—I know a village near to a big town where strawberries grow like the proverbial willow. They are a standing crop in the cottage gardens and allotments, and the working people do well out of them. There is a big demand for small holdings in this parish, and more than one who craves for a few acres of land has strawberries in his mind. Quite right. It has been proved that this fruit will grow here as it does in few places, there is a demand, and a market but a few miles away, and it will surprise me if the establishment of small holdings does not lead to a development of strawberry culture in this particular district.

In Kent, I am told, there is a big demand for small holdings, and this is a county in which agriculture and horticulture are already closely allied in farming. We hear of seasons of glut and low prices, but still official figures show that fruit culture is increasing, and it will increase more when small holdings become an accomplished fact. There can be no doubt, I think, that the new Act will have a marked effect on the horticulture of the country, and it is an open question whether this branch does not offer greater possibilities than agriculture

The thing is to have the right men. There are plenty of them, if they want to be small holders, for every village possesses sturdy fellows, who are the backbone of the country, men who are gardeners because Nature fashioned them that way, and they demonstrate their skill by the manner in which they manage their gardens and allotments, and the produce they get from the above. They are real workers, these men, and one never sees them loafing about or supporting street corners. They have other things to do, are supporters of local horticultural societies, and one sees them staging produce of which they have reason to be justly proud at the village flower show. Many men of this stamp are doubtless contented with their lot, and do not aspire to be small holders, but others crave for a bit more land, and see themselves in the future small independent proprietors. It is men of this type who should be encouraged, for in their hands, and given reasonable opportunities, small holdings will succeed. In fact, if men like the above do not, and cannot, make small holdings pay, and become a blessing to the country, the case is hopeless.

G. H. H.

Primula Forbesi. — This pretty little primula is a native of China. It is a charming greenhouse plant, and one deserving of wider cultivation. From seedlings raised in September and pricked off into pans of loam, leaf-mould, sand, and a little well-rotted cow manure, and kept cool, the plants will soon begin to show their lilac flowers, which are borne on long stems, rising fifteen or twenty inches above the little plant. These spikes may be arranged in vases, with some of the lighter grasses, and they then look very pleasing. Some prefer pot culture, but if plants are placed three or four inches apart in pans the effect is more pleasing, and the plants continue to bloom for a long period. Primula Forbesi is best treated as an annual. —W. D. P.

PROFITABLE FRUIT GROWING for Cottagers and Small Holders of Land.—By John Wright, V.M.H. A Gold Medal Essay, written for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

NATURAL GUANO DEPOSITS

It is a matter of general knowledge that many of the deposits of natural guano are being rapidly depleted, and others which still supply considerable quantities of this useful stimulant and plant food, are producing supplies that fall far short of what really good guano should be, with the result that such samples have to be augmented with ammonia salts, etc., in order to bring it up to a saleable quality.

The value of guano is so well known to most readers that I need not dwell upon its utility for garden and greenhouse crops; suffice it to say, that as a summer stimulant and plant food a good sample of natural guano will always be a first-rate gardener's help.

In view of the extreme shortage of guano, the last few years have seen an immense quantity of artificial products placed upon the market as a substitute for it. These manures are of varied quality, but it may be said that the substitutes have filled the breach well, and have provided cultivators with excellent fertilising compounds.

A New Source.

Welcome, indeed, is the news that a new source is to be opened up, to give its wealth of natural guano to a waiting world. The islands in the South Atlantic, known as Gough Island Nightingale Island, and Inaccessible Island, belonging to the Tristan da Cunha group, have been licensed by the Government to a company formed expressly for working the guano deposits.

But it is the question of guano which claims our interest. The deposits were noted by the famous "Challenger Expedition," and the naturalists who accompanied the expedition estimated that the "penguin rookery" of Nightingale Island comprised at least four hundred thousand birds, and recent expert observers have stated that this estimate probably falls far short of the mark. The wealth on this island alone is apparent from the statement that the guano varies from four to eight feet in thickness, and runs almost down to the water's edge. A moderate computation places this stretch of guano at one million tons.

The deposits on Inaccessible Island are not so deep, varying from one to three feet in thickness, but the total will come up to a high figure. The same may be said of Gough Island, which is by far the largest of the three.

The Penguins.

It is to be hoped that (notwithstanding the immense quantities of the guano) the penguins will be interefered with as little as possible, for the future supplies depend upon the presence of large colonies of these stolid, but useful sea birds, and the Government, when receiving their "royalties" upon the guano, should remember the birds which are the "bringers of wealth," and ensure their protection as far as possible.

The gardener working among his fruits and flowers, assisting Nature in the production of high-class specimens with this natural guano, will surely feel somewhat grateful to the penguins for providing such a concentrated, effective manure. The uses to which it can be put are innumerable, the "catch crops" of the kitchen garden are especially benefited by its presence. Greenhouse fruits, such as tomatoes, forced strawberries, etc., etc., will give good results from occasional dressings, while its merits as a developer of floral beauty is known to all.

P. S. Hayward.

BULBS FOR SPRING PLANTING.

Gardens can be quickly improved by planting such bulbs as are suitable for dealing with in spring; any deficiencies in beds, for example, may be made up for without any risk of injury to permanent plants; any gaps in herbaceous borders that are not to be perennial-supplied until autumn, can be given up now to bold masses of gladioli. The rosery ground will take no harm if dotted over with ranunculus tubers, in the rich soil of which they will revel, and the shrubbery clearings will become glades of scarlet, blue, purple, pink, mauve, or white, if a few hundred Giant French anemone tubers are inserted.

Few gardeners seem to take advantage of the fact that these anemones can be finely cultivated in turf. They do not flourish under trees, so are not fit for woodlands, but the effect of a grassy bank liberally planted with the white and scarlet varieties is gorgeous indeed. Slopes of turf against front entrance steps, or the longer stretches forming terraces, are admirable places for anemone culture. If desired, the more costly St. Brigid anemones can be used in preference to the French, while rougher spots can be chosen for massing the cheap single anemones, of which "The Bride," with its satiny white petals and centre cushion of pale green velvet, is a lovely and familiar representative.

Dutch anemones can be bought in twenty-five different named varieties, and the double chrysanthemum-flowered anemones are of very distinct beauty. Anemones are obliging plants, for so long as their tubers are kept dry they can be planted at any time of year, and especially if soaked for twelve hours in tepid water previous to use, will soon provide beautiful flowers and foliage. I am assured that the early Scarlet Anemone fulgens may be had in blossom in June from a March planting of tubers that have had their attempts at earlier sprouting frustrated, but cannot report on this from experience.

Persian ranunculuses make an especially good show at the feet of standard rose trees, and they will not harm dwarf teas if planted among them. They are admirable, too, as a covering for bank sides and summits wherever a vivid summer show is desired, and the lifting of their tubers after the season is an easy piece of work. In rockery chinks I have known Turban and French ranunculuses thrive and flower year after year without removal. Beds of self-coloured ranunculuses prove eminently attractive upon lawns, violas being the best carpet and edging companions. The Rose Turban ranunculuses are grand rising above the cream rayless viola Sylvia, and when out of bloom they can be raised, replanted in good reserve ground to finish growth, and their places be filled by pink double zonal pelargoniums turned out of pots.

Gladioli, bought by the hundred, are fit to fill up spaces in any sunny borders of rich soil, as their sword leaves rise well above perennials of average height, and do not overcrowd. The hybrid Lemoinei class is so hardy that in most gardens the bulbs can safely be left out permanently, thus saving a great deal of autumn labour. For massing they should be placed only nine inches apart, a heavy mulch, given when leaves are well up, will afford all needed nourishment.

Gladioli should not be planted on raised banks or in draughty alleys, otherwise gales will lay them low; on the inner slopes of ground leading down to rockery dells or pools they give an exquisite effect, however, and obtain welcome shelter.

These three kinds of bulbous plants should be largely cultivated by gardeners who have to supply cut flowers in quantity, the anemones and ranunculuses being best for table decoration, and the gladioli for furnishing bowls or giant standing vases for halls and corridors. Gladioli in pots are of immense service also, whether in the house, grouped round by ferns and foliage subjects, or to give colour and elegance in the conservatory. M. H.

RONDELETIA CORDATA.

This evergreen flowering shrub, usually treated as a stove or intermediate house plant, will succeed in an ordinary greenhouse temperature, under which conditions it is rarely attacked by thrips, that, in a warmer structure, are often troublesome. When growing freely it forms a bold shrub, clothed with stout leaves, the largest being about six inches in length, and half as much in width. They are cordate at the base, hence the specific name. The flowers, which are borne in terminal clusters, suggest those of the laurustinus, but they are larger and different in colour. In the bud state they are deep pink, but when expanded the interior of the flower is blush, with yellow hairs in the centre. Cuttings root readily, and neat little bushy plants may be grown in six-inch pots. These will bear a cluster of flowers on every shoot, and that, too, at this season of the year.

There is a nearly allied species, R. amœna, which differs from the preceding in its flowers being somewhat lighter in colour, while the leaves are thinner in texture and more hairy. Of the two I prefer R. cordata. Both these species are natives of Guatemala.

They were formerly known by the generic name of Rogiera, as also was another species, R. gratissima. This, a native of Mexico, may be grown in the greenhouse, and it forms a very pretty feature there when in flower, which is generally in the late autumn and winter months. The flowers are, as in R. cordata, a good deal after the manner of a laurustinus, and they are borne in rounded clusters, as in that well-known shrub. The individual blooms consist of a narrow tube nearly an inch long, with an expanded mouth in the form of a five-pointed star, with rounded lobes, the whole flower being about one-third of an inch across. It is of a pretty blush tint, the unopened buds being of a deeper hue.

Rondeletia speciosa, with clusters of bright vermilion-coloured flowers, was very popular as a specimen plant in days long gone, when it used to be looked upon as requiring the temperature of a stove. It may, however, be grown in a greenhouse the same as the others.

Botanically, the rondeletias are nearly related to the bouvardias; indeed, one species, the rare Rondeletia strigosa, used to be known as Bouvardia Roezli. Between this and the garden varieties of bouvardia some hybrids were raised many years ago in Messrs. Henderson's nursery at St. John's Wood. W. T.

HARDY FLOWERS are always popular, as they make the garden bright and attractive, and require but little attention. All the information required for their successful culture is given in Easily Grown Hardy Perennials, by G. H. Vos. Price 5s. net, by post in box, 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

CALANTHES.—So many instructive and interesting notes have recently appeared in the Gardeners' Magazine on the best methods of cultivation that it is scarcely necessary for me to refer to them again in this column, but I might mention that as the new growths are now so far advanced that the young roots are making their appearance, repotting should be attended to without delay. As we have perhaps one of the most complete collections of varieties in cultivation, I might perhaps be permitted to draw attention to some of the desirable kinds that do not appear to be in general cultivation, judging from the kinds that have been enumerated. C. Brynn seems to be a general favourite, and is undoubtedly one of the most useful for the purpose of supplying cut sprays, but it is rather strange that C. W. Murray is overlooked. Here we have a variety equal in vigour to the last-named, with a more decorative flower scape, and in every way worthy of being cultivated as extensively as C. Veitchi. C. Burfordiense completely puts C. Veitchi into the shade, being superior in colour and finer in flower. We have had scapes carrying between forty and fifty flowers during the past season. C. Victoria Regina, a pale rose-pink, is charming, and a later flowering variety, with larger flowers of the same type, but deeper in colour, C. Phœbe, is deserving of attention; these two last-named are quite distinct and are most effective for general decoration. The absolutely pure white C. Sibyl, producing scapes of the C. Veitchi type, should be in every collection; it is not easy to flower, but is most effective when mixed with the others of darker tints. C. rubro-oculata (not C. vestita) is a very fine addition, much darker in colour than C. Veitchi, and having a rich purple eye. It is not a vigorous grower, and is produced from the round class of pseudo-bulb. C. Clive is a vigorous grower and a grand addition to the dark section: one of the best for decorative purposes when the plants are strong. C. Oakwood Ruby and C. Chapmani are the two darkest calanthes in cultivation, but as the stock of each of these is very limited indeed it will be some time before they will pass into general cultivation.

PHAIO-CALANTHES.—These bigeneric hybrids, derived from the intercrossing of calanthes and phaius, as the name implies, are most useful for decorative purposes. We find the varieties of these hybrids do best when grown in an intermediate house temperature; in fact, we grow these and the phaius hybrids under the same conditions as that given to the winter-flowering cypripediums. They commence flowering in February and March, and last a long time in perfection. The potting requirements are the same as that afforded to calanthes and phaius. The phaius hybrids that have been derived from the influence of C. Humbloti, are now rapidly advancing their flower scapes. The plants should be placed in a position, within reasonable distance of the roof glass, which will prevent the scapes becoming unduly drawn, and a more symmetrical scape will be produced when the flowers expand.—H. J. Chapman, Oakwood Gardens, Wylam-on-Tyne.

CONSERVATORY AND GREENHOUSE.

THE SUN will now afford sufficient heat for plants in the conservatory, and sometimes even shading will be necessary. Abundance of air must be given, and, in proportion to its heat and dryness, an increased supply of water will be necessary. But this must not be given indiscriminately, for plants that are making but little growth will require a much less supply than those that are vigorous.

RHODODENDRONS. — There are few plants better adapted than these for decorative work at this season of the year. Some of them are now beginning to lose their beauty; as their flowers commence to fall it will be necessary to tie down the shoots, so that when the new growth is completed the plants will assume a more or less regular form. Syringe them twice daily as well, and moisten the stages, and this is a very important detail in helping the plants to make a good growth, and to flower well afterwards. Repotting will be necessary only in a few instances, as they do equally well in rather small than large pots.

AZALEAS.—Many of these will be going out of bloom. Care should be taken that the seed vessels are not allowed to remain and ripen, as they are to some extent prejudicial to growth. Place the plants in a genial temperature for a few weeks, where they can be syringed twice a day or so until growth is completed, when they will need hardening in a cooler, drier position, in readiness for their summer quarters.

CHRYSANTHEMUMS. — The treatment chrysanthemums receive in the early stages of their existence has undoubtedly much influence on the quality of the bloom they produce. At this time of the year I have frequently seen young plants standing on greenhouse stages far from the glass and crowded together. The chrysanthemum has an accommodating nature, and will recover from a check much more easily than many things, but if really good blooms are desired the plants should not be subjected to treatment which can exercise a weakening influence on them. Good growers make a point of removing the young plants to cold frames as soon as they are sufficiently rooted to allow of putting them in small pots. From the time they begin their career they should have the benefit of the full light, with a free exposure to the air. These advantages they cannot enjoy in any other way.

ROSES UNDER GLASS.—There will soon be the need for a shift in the case of very young plants. My own, that were rooted from cuttings a little later than this last year, were put into three-inch pots early in January, and are now being shifted into six-inch pots. Own root roses enjoy a more porous soil than those worked upon the briar stock. A slight shade will soon be necessary for the rose house, not so dense as darkens the house in any way, but just sufficient to break the fiercest of the sun's rays. Under these conditions, and not otherwise, we can maintain a moist atmosphere, and an occasional syringing during the prevalence of very bright weather. Air that is alternating between extremes of dryness and moisture, with wide changes of atmosphere, will not suit roses. Liquid manure may be sprinkled about when damping down, as well as freely afforded to all plants well established. It is impossible to obtain high colour and quality in the flowers without having the same in the foliage. A little more sulphur should be added to the syringing solution during this trying time as regards mildew. It is best to keep both this and liquid manures far weaker than many use, preferring to use them more frequently than run the risk of overdoing in strength. —T. B. Field, Ashwellthorpe Gardens, Norwich.

THE FLOWER GARDEN.

LAWNS.—Mowing the lawns will now need constant attention. If previous instructions have been carried out, viz., levelling and rolling, continuing the latter as often as circumstances will permit, they should now be in good condition. Do not allow grass to become too long before mowing, and do not put the knives or cutters too close to the ground the first time of mowing. It is better to cut closer the second time, and after that the grass will be clean and vigorous, and the close cutting can be continued. Should the grass be in a weakly condition, and the soil be of a rather hot and poor sort, it may be advisable after the second or third mowing, if grass has not been allowed to grow too long, to cut without the grass-box on the machine. The cut grass will be of some assistance and help to induce growth, though in a general way it is best to use the grass boxes on, and collect the grass as mown. Slopes and places where the machine cannot be used must be cut with a scythe, and we find the riveted scythes much better for short grass than the solid-back ones, and those of medium length, say, three feet, better for general use than the long ones. Do not allow heaps of mown grass to remain on lawns or fermentation will rapidly ensue, causing quite a strong heat that will damage the turf underneath.

THE ROCK GARDEN must be closely watched. Many of the primulas, anemones, irises, hepaticas, primroses, miniature narcissi, muscarias, aubrietias, fritillarias, chionodoxas, cardamine, iberis, alyssum. erythroniums, and others, are revealing more and more of their beauties. Make note of the positions in which they appear to thrive best, and where the best effects are obtained, as generally some annual rearranging can be practised of the least permanent ones and those most readily transplanted. The early-flowering rhododendrons and sedums are also opening, and if the rockery is of any pretensions at all, there will generally be a few places where such as these, and some members of the erica family can be established.

SUCCESSIONAL SOWINGS of sweet peas, poppies, mignonette, and other annuals should be made in the flowering quarters.

DAHLIA ROOTS that are still in their winter quarters should at once be attended to. Tuberous-rooted begonias should also be kept growing, but avoid coddling or drawing them up. Close attention should now be paid to the hardening off and preparation of all summer bedding plants. If any have not yet made sufficient growth, encourage them to do so as much as possible without unduly weakening them.

FLOWERING PLANTS in beds should have close attention. Support flower spikes that need it to prevent damage from wind or rain. Should severe frosts appear probable give temporary protection to such plants as require it. As plants pass out of bloom clear the beds, and prepare them for summer occupants. Bulbous plants may be carefully lifted and heeled in in a sunny position to about their previous depth, where the bulbs will ripen off, and in autumn can be planted in wild garden or pleasure grounds. Beds may be liberally dressed with thoroughly decayed manure or leaf-soil, wood ashes, burnt refuse, old mortar, or old potting soil, especially if the soil is naturally of a cold, wet, or adhesive texture.

WALL PLANTS.—Evergreens in pots that are suitable for walls may still be planted, such, for example, as the ceanothus, Cratægus pyracantha, ivies, Garrya elliptica, Choisya ternata, etc. Attend to young growths of clematis and other things, tying-in and securing them before any damage occurs. The early pruned roses on sunny positions will now be making growths; secure and protect these; also prevent aphis or greenfly becoming established on them.—E. F. Hazeltcn, Knowsley Gardens, Prescot.

HARDY FRUITS.

FRUIT PROSPECTS.—The cold weather we have experienced has greatly retarded the growth of fruit trees generally. Notwithstanding this, there is a good promise of bloom of both apples and pears. Peaches and nectarines are not so plentiful, owing, no doubt, to the wood not properly maturing last year. On trees growing on south walls there are ample blooms, but on those growing on a less favourable site the buds are somewhat short.

DISBUDDING. — As soon as the young growths are forward enough disbudding should be commenced, and continued at intervals until sufficient have been removed. If properly attended to there should be little pruning left to be done next winter. Remove all out-growing shoots, and those at the back, and a few along the leading growths, taking great care to preserve those which will be wanted for filling-up space, and for fruiting the following year. Do not remove too many at the first time, only sufficient to keep a balance between the fruit and growth. Disbudding is one of the most important details of fruit culture, and should not be left to an inexperienced hand, for the formation of a well-trained fruitful tree depends almost entirely on the removal of ill-placed shoots, and the preservation of those required to build up a well-balanced head. It is a good practice, when disbudding, to make sure of one good shoot at the base of last year's growth, on the upper side, if possible; train up the leaders if there is room for extension; it not, pinch out the point at the fourth leaf. Avoid at all times wholesale thinning, which frequently leads to the loss of fruit when about the size of peas.

YOUNG TREES that were planted late need not be disbudded for at least some time yet. Every care, however, should be taken when the shoots are long enough to secure the right ones for filling up space and the formation of a neatly-trained tree. Keep a sharp lookout for aphis, and as soon as they put in an appearance give the trees a syringing with quassia extract. In the case of fruiting trees, syringing with insecticides is best deferred till the fruits are safe; dusting with tobacco powder will keep the insects in check till the fruits are sufficiently advanced.

ORCHARDS. — The trees need to be watched during the time the flowers are expanding. I have known sparrows destroy many of the buds at this period, and if not checked, in some instances they will damage the lot. A good syringing overhead with soapsuds, followed with a dusting of soot, wood-ashes, etc., will, in a great measure, keep them in check. It will be well to examine all late-planted trees, and give the soil about the roots a good treading; then lighten the surface, and if the land is light and porous, a mulching of short manure will be very helpful should the weather prove dry.

HORIZONTALLY TRAINED TREES.—If any of these were root-lifted, and somewhat severely pruned late, see that during fine weather the branches are well syringed two or three times daily, and kept as moist as possible, otherwise very little growth or foliage will be produced this year.

FRUIT ROOM.—As soon as the room is clear of fruit see that the walls and shelves are thoroughly washed and made clean; full ventilation should be afforded when convenient. If fruit rooms are to be built they should be made of suitable thickness to exclude frost, and a good one should be viewed before attempting to build. Without a suitable store-room for apples and pears, it is of very little use attempting to preserve the fruit for a reasonable length of time in a good sound condition, and the loss of good fruit in a season is considerable.—H. Markham, Wrotham Park, Barnet.

Freesias.—These form a most delightful addition to the early-blooming plants in the greenhouse. Their profuse flowering, their quaint construction, and delicately sweet perfume, all combine to render them most attractive, and they are of very easy culture. The main point to be aimed at in their cultivation is the thorough drying off of the bulbs, even to the point of roasting. The soil most suitable to grow them in is well-rotted leaf-mould, light loam, a small quantity of well-decayed manure, and sand. It is best to put them in as cool a place as possible when they are starting into growth, and as soon as they show above ground place them out where they are fully exposed to the air, but sheltered overhead. I usually plant about half a dozen bulbs in a 4½-inch pot, and as the flower stems are very heavy for the size of the bulbs, I put a very thin support to each. this keeps them erect. and prevents them from sprawling over the pot. After the plants have flowered, and have been well dried off, lay the pots on their sides, there to remain until the time for potting comes round again.—T. B. Field.

AN INTERESTING REMINISCENCE.

I should indeed be lacking in courtesy, as well as gratitude, did I not tender you very sincere thanks for the kind references made to me and my horticultural career in a recent issue of the GARDENERS' MAGAZINE. The old saying, "Nothing is so likely to happen as the unexpected," certainly applies in this case, for I looked for nothing so little as the publicity you have been pleased to give me. In saying so much kindly—at least my innate modesty was overlooked, and because of that I have hardly yet recovered from my surprise and blushes on thus, unlooked for, finding myself so famous. Obliged to withdraw through advancing age from some of my old literary work, I have seen with pleasure, not only how admirably, and indeed beautifully, the GARDENERS' MAGAZINE is now presented to its numerous readers, but also note that some old friends still remain your esteemed contributors.

My first association with the GARDENERS' MAGAZINE must have been about 1870 or 1871, as I have a highly-prized memento of such association in your predecessor's (Mr. Shirley Hibberd) "Beautiful Leaved Plants," in which his valued autograph is inscribed, dated 1871, or 37 years ago. That is not the only such memento from him I also possess. How long since that great GARDENERS' MAGAZINE dinner was held in Aldersgate Street I cannot remember—[1872, ED.]—but I was one of the guests, a great honour indeed, and, oh! how many of our old great men have since passed away. When I think of all I have known in horticulture who have, having done their part so nobly in life, gone before, I sometimes feel as if I were rather stranded on the shores of time, left a sort of human derelict, soon to break up and be forgotten. Having entered my 77th year I marvel that in spite of such age I can still be so active, and do so much. My earnest hope is I may be able so to work and be active to the last. Then I shall pass away happy.

You have kindly referred to my elder brothers, William and Richard, both most earnest and devoted horticulturists. What, wonder they were so, for each of us might be said to have drunk in gardening with our mother's milk. My father, a gardener, was, during our boyish days, foreman for many years at the then great nursery of Messrs. W. Page and Son, at Southampton, a nursery not, as so many are now, a specialistic place, but one in which every section of horticulture as then known was fully represented. No wonder we boys grew up intense lovers of all that pertained to gardening, an intensity that ceased with those who have gone, as it will exist with me, only to end in death.

I often think how greatly we who have devoted our lives to gardening are favoured in our vocation. We have but to think of the worker in the coal or iron mine, of the weaver in the mill, the toilers amidst the heat and grime of iron and steel manufactures, of the worker in wood, stone, or brick, of any indeed whose lives have to be spent in the dull monotony of the office, the store, the factory, or even in the composing room. How different with the gardener, whose work is in the open, tilling the sweet responsive soil, cropping it with produce that shall return to him good wholesome food or beautiful flowers, sweet to smell, and full of lovely colour to the eye; or perhaps in the form of noble trees, the finest production of mother earth; or of shrubs or other things, all of which gladden the eye and make the earth beautiful. Such is, or has been, our work, really creating from out of swamps, or woods, or wilds, or wildernesses, veritable paradises of beauty, of purity, and of sweetness. We may have to work hard, or have done so, but at least in gardening we have found many glorious solutions.

ALEX DEAN, V.M.H.

FORESTRY EXHIBITION IN ABERDEEN.

Elaborate preparations are being made for the forestry exhibition to be held under the auspices of the Royal Scottish Arboricultural Society, in the showyard of the Highland and Agricultural Society, at Aberdeen, on July 21 to 24. The large, interesting, and educational display made of British forestry at Lincoln last June under the auspices of the Royal Agricultural Society of England was duly noted by all Scotsmen interested, and the committee in charge of the Aberdeen arrangements are leaving no stone unturned to produce a similar, if not better, display. The Royal Scottish Arboricultural Society has already conducted seven progressively successful exhibitions, which have done much for the development of forestry in the country. To make assurance doubly sure for the success of the eighth exhibition, a strong and very influential committee has been chosen to take charge of the arrangements. They are Mr. Sydney J. Gammell, of Drumtochty and Countesswells; Mr. John Crozier, forester, Durris; Mr. John Clark, forester, Haddo House; Mr. Charles France, Aberdeen; Mr. G. U. Macdonald, Peebles; and Mr. Adam Spiers, Warriston, Edinburgh.

The committee have issued a schedule inviting members and others interested to offer exhibits for approval, mentioning that it is desired to encourage exhibitors in various classes, and in the event of an exhibit of special merit being brought forward the judges may recommend the society's medals or other award. Various exhibits are suggested as suitable, but the committee will welcome offers of other objects relating to forestry in any of its branches. As indicating how anxious the committee is to make the display an unqualified success, it may be mentioned that valuable prizes are offered in eighteen classes.

In addition to the prizes for timber, etc., one or more medals may be awarded by the judges for specimens of the fruits of trees, together with drawings or photographs showing the morphological structure of fructification in each particular species, each specimen of an individual species to be mounted on a separate card.

For an approved report on the damage done by insect pests injurious to forest trees, and the measures that have been successfully adopted for their extermination, the report to be accompanied by specimens of the insects and damage done.

For a collection of fungi injurious to forest trees and shrubs. Fragile specimens may be illustrated by photographs.

Examples or photographs of the damage caused by squirrels, moles, etc., to various kinds of trees or of any abnormal growth.

Entries for the exhibition must be made to the secretary, Mr. Robert Scott, 75, Union Street, Aberdeen, not later than May 30.

Cotoneaster Simonsi.—The reference to this climber (p. 238) is opportune. In this neighbourhood it is commonly employed as a wall plant, and the front of one cottage, facing east, is entirely covered with it, 16ft. high, and at the present moment, March 28, the whole crop of berries remains and presents a handsome appearance. The only fault one can find with it is the want of contrast when growing against a red-brick wall, owing to the loss of leaves. This can be remedied by planting a small-leaved ivy as a base, against which to display the bright-coloured berries. One of the small ivies, as palmata, or a form of the ordinary English ivy, would not interfere with the growth of the cotoneaster, but would much emphasise the effect of the berries in winter. — E. MOLYNEUX, Swanmore Park.

EELWORMS IN HOLLOW POTATOES.

An interesting note in the current "Kew Bulletin" shows that during the autumn of 1907 some diseased potatoes were submitted to Kew for investigation. The potatoes were well grown and externally showed no trace of injury or disease, but when cut open were found to be hollow, an external shell, varying from a quarter to half an inch in thickness, remaining intact.

In some examples the cavity was quite empty, dry, and lined with a shrivelled mass, suggesting the previous presence of some semifluid substance that had contracted and dried up. In other cases the cavity was more or less filled with a glairy, unpleasant smelling pulp, which on microscopic examination was found to be teeming with nematodes or eelworms.

A series of sections revealed the fact that the nematodes effected an entrance into the tuber through the original point of attachment to its branch. Having once gained an entrance the nematodes gradually used up the substance of the tuber, working from the centre outwards until their progress was checked by the vascular zone which lies at some distance within the periphery.

This zone appeared in every instance to have acted as a perfect barrier to the further extension of the eelworms, hence the tissue lying between the vascular ring and the periphery of the tuber remained uninjured.

The nematode appeared to be Aphelenchus pyri, Bastian, a species originally found in decaying pears. Its presence in potato tubers, notwithstanding the amount of injury effected, does not necessarily prove the nematode to be a true parasite; it is at most a wound-parasite, gaining an entrance into the tuber through the minute opening formed by the decay of the tissue enclosed by the vascular ring at the point of its entrance into the tuber.

Two tubers infected at the point indicated above, by covering the scar with slime containing eelworms obtained from a diseased tuber, were placed under a bell-jar, and kept in the dark at an average temperature of 65° F. After ten days one of the tubers was cut open and revealed a cavity about one inch in diameter filled with slime containing myriads of eelworms. The second tuber was allowed to remain for a month when the internal cavity was found to have reached the limit of its extension, that is up to the vascular ring.

In a second experiment the "eyes" of two tubers were covered with nematode-bearing slime, and afterwards placed under conditions similar to those described in the previous experiment. After remaining for a month the nematodes had not effected an entry into the tuber, although in some instances small "sprouts" had pushed from the "eyes" through the slime. This experiment may be taken to prove that the nematodes cannot effect an entry through an unwounded surface, even when the tissue is quite young.

No trace of bacteria or fungi was found in the slime.

The potatoes were purchased at the Brentford market, hence their source of origin is unknown, as is also the nature of the soil in which they were grown, or the kind of manure used, etc. Judging from the large percentage of hollow tubers present in the small quantity purchased, it would appear that a local epidemic, caused by nematodes, had existed where the potatoes were grown.

The above account is not intended to convey the impression that all hollow potatoes are due to eelworms. Potatoes are often more or less completely hollowed out by centipedes, more especially by Julus pulchellus. In such instances, however, an entrance is effected by commencing at the surface and eating their way into the interior of the tuber.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

APRIL 14.

Although spring is late, there was little evidence of its dilatoriness at the Royal Horticultural Hall on the above date. Once more the hall was filled with beautiful and interesting plants and flowers that delighted a large attendance of Fellows and their friends.

FLORAL COMMITTEE.

A brilliant exhibit of well-grown hippeastrums, consisting of about a couple of hundred plants was contributed by Mr. Sanders, gardener to Alfred de Rothschild, Esq., Halton Hall, Bucks. It was a pity that in every case the anthers had been removed from the blooms. Rich crimson and orange-scarlet varieties predominated, but there were a few good light varieties. The arrangement of the group, with asparagus and ferns, was good, and everything was well grown. Miss A. Smith, Barnham, Bognor, contributed coloured primroses and polyanthuses and other early flowers. The Misses Hopkins, Mere Gardens, Shepperton, set up a very pretty miniature rock garden, with a goodly set of anemones, primroses, primula species, and alpine shrubs.

Blue hydrangeas were the great attraction in Messrs. James Veitch and Sons' group, and they were particularly fine and rich. With these were Boronia megastigma, Xanthoceras sorbifolia, Rhododendron Forsterianum, Kalanchoe Felthamensis, and the very showy Erica propendens, and a large specimen of the handsome Medinilla magnifica. In another very large group facing the entrance this firm had white, pink, and blue hydrangeas, some fine forced lilacs, the beautiful Azalea rosæflora, the new Clematis montana rubra, and the very handsome Rhododendron Handsworth Early Red, a very handsome variety.

Perpetual carnations were well displayed by Messrs. Hugh Low and Co., whose big vases of Harlowarden, Mrs. T. W. Lawson, Oriflamme, Red Lawson, Lady Bountiful, and Helen Gould were great attractions, as also were their plants of Metrosideros floribunda, acacias, weeping standard roses, and the handsome Lotus peliorhynchus.

A selection of small caladiums, richly coloured and representing the best varieties, was set up by Mr. Charles Turner, Slough. Rhododendron Forsterianum and R. Aucklandi hybrida were grandly shown by Mr. W. A. Cook, gardener to Sir E. Loder, Bart., Leonardslee, Horsham; these are beautiful, large-flowered white varieties. Rockery and alpine plants were extensively displayed by Messrs. J. Peed and Son, West Norwood, whose coloured primroses were a feature. Messrs. Wallace and Co., Colchester, exhibited Primula denticulata finely, with Iris persica, Gerbera Jamesoni, aubrietias, the pretty Viola gracilis and a few tulips; the pots were rather too prominent in this exhibit.

A grand lot of perpetual carnations and beautiful bunches of Lilium longiflorum were set up finely over maidenhair fern by Mr. W. H. Page, Tangley Nursery, Hampton. Mr. Page showed some remarkably fine flowers of Fair Maid, White Lawson, Harlowarden, Enchantress, and Mrs. T. W. Lawson carnations.

The carnations set up by Mr. A. F. Dutton, Iver, Bucks, were, as usual, excellent; Mabelle, Rose Pink Enchantress, Britannia, and Aristocrat being very fine. Mr. H. C. Pulham, Elsenham, Essex, staged a small rock garden, filled with a selection of choice early flowers.

Stove foliage plants in variety, notably palms and big-leaved anthuriums, came from Messrs. Wm. Bull and Sons, Chelsea. Mr. J. R. Russell, Richmond had an exhibit of lilacs, Azalea mollis, cytisus, clematises, Prunus triloba, weigelas, etc. An early exhibit of Japanese maples in considerable variety was made by Messrs. Thomas Cripps and Son, Tunbridge Wells, a firm that makes a speciality of these graceful plants. This firm had a fine new white clematis, with finely-formed flowers; this is C. lanuginosa Crippsi. Mr. H. D. Broughton, Birch House, Andover, brought up a small group of a fine strain of herbaceous calceolarias. The Misses Kipping, Hulton, Essex, had a very bright display of alpines and early flowers, primulas, and aubrietias predominating. From the Guildford Hardy Plant Nursery Company, Guildford, came a selection of alpines and early hardy border flowers.

Roses in pots, from Messrs. Wm. Paul and Son, Waltham Cross, were greatly admired; the leading varieties were Lady Ashtown, Isabella, Tausendshon, Margaret, a beautiful pink variety raised at Waltham Cross, Waltham Bride. Messrs. G. and A. Clark, Lim., Dover, submitted a brave show of primroses and polyanthuses, aubrietias, iris, deutzias, etc. The brilliant exhibit of cut zonal pelargoniums from Messrs. H. Cannell and Sons, Swanley, was a great attraction, as the flowers, trusses, and bunches were very large, and the colours especially rich.

Messrs. W. Cutbush and Son, Highgate, N., filled a whole table with good things. Along one side they had lilacs, Azalea mollis, the dwarf and useful Mrs. W. H. Cutbush rose, forsythias, laburnums, heaths, and the very beautiful and brilliant new coleus named Cordelia, a variety that gained an A.M. last year. On the other side of the table they had a rock garden arrangement filled with flowering alpine shrubs, Phlox canadensis, Stylophorum diphyllum, Primula rosea, Cypripedium pubescens, Trillium erectum, T. stylosum, and Mertensia virginica; with the other things came a fine exhibit of perpetual carnations in popular varieties. A beautiful lot of perpetual carnations came from Mr. C. F. Waters, Deanland Nursery, Balcombe, whose Malmaisons and vases of Enchantress, Rose Pink Enchantress, White Enchantress, Winsor, Marmion, Autocrat, and Beacon attracted a great deal of attention. Messrs. G. Jackman and Son, Woking, showed alpine and herbaceous plants and flowers in variety.

Messrs. H. B. May and Sons, Upper Edmonton, showed an interesting exhibit that contained well-grown cinerarias, Clorinda pelargoniums, Princess Ena, and Mdme. Levavasseur, and White Pet roses, the dwarf and brilliant Pride of Zurich salvia, and the new Cyrtomium falcatum Mayi (A.M.), a crested form of this useful fern. Messrs. J. Cheal and Sons, Crawley, exhibited a collection of alpine flowers and shrubs. Mr. J. Crook, The Avenue, Camberley, Surrey, set up a small group of a very bright and useful strain of polyanthuses, showing a large variety of colouring.

Mr. Maurice Prichard, Christchurch, Hants, had a particularly fine lot of coloured double and single primroses, good aubrietias, irises, and other choice early flowers. Messrs. T. S. Ware, Lim., Feltham, sent a group of early flowers that contained Orobus Gibberi, white-flowered; Saxifraga Rhei, Dendromecon rigidum, double primroses, Primula mollis and P. Sieboldi. Very beautiful and interesting was Viburnum Carlesi, a sweetly fragrant, compact, white-flowered hardy shrub, shown by Mr. Bain, gardener to Sir Trevor Lawrence, Bart., Dorking.

A wonderful display of beautifully-grown and admirably shown roses was made by that famous grower, Mr. George Mount, of Canterbury. This was the most attractive exhibit in the show, and one could hardly get past it during the earlier part of the afternoon. The varieties so freely set up in vases and stands and boxes were Richmond, Mdme. C. Ramey, Mdme. Abel Chatenay, Mdme. Pernet Ducher, Lady Ashtown, Catherine Mermet, Joseph Lowe, Frau Lilla Rautenstrauch, Mrs. J. Laing, Captain Hayward, La France, Souv. de Pres. Carnot, Prince de Bulgarie, Killarney, Senateur Belle, Ulrich Brunner, and Kaiserin Augusta Victoria.

Choice shrubs were submitted by Messrs. Paul and Son, Cheshunt, who had Prunus Pissardi fl.-pl., Cornus sanguinea Moseri, brightly variegated; Vitis Henryana, V. Thomsoni, Lonicera Maacki, Viburnum tomentosum Mariesi, and a few roses. Rhododendron grande was well shown by Mr. W. G. Vivien, Clyne Park, Blackpyl, South Wales.

Messrs. Carter Page and Co., London Wall, set up a small, but very pleasing and particularly bright group of fresh violas.

ORCHID COMMITTEE.

Mr. G. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, had a very handsome exhibit of orchids, the leading kinds being Cymbidium eburneum Goodsonianum (A.M.), Odontoglossum Lambeauianum Harry Goodson—very richly marked, Cattleya intermedia carnea, and Brasso-cattleya Digbyano-Mossiæ Wagneri. Mr. A. Jensen, Lindfield, Hayward's Heath, brought up some finely-formed Pacho varieties of Odontoglossum crispum, O. triumphans, and Cattleya Mendeli, all well-grown and representing excellent forms. A few choice orchids were shown by Messrs. Jas. Veitch and Sons, Chelsea; their group containing some beautiful Odontoglossum crispums, Cattleya Schroderæ, Renanthera Imschootiana, and Ada aurantiaca.

The contribution of orchids made by Messrs. Hugh Low and Co., Bush Hill Park, Enfield, contained odontoglossums in variety, Dendrobium Wardianum, D. Pierardi, D barbatulum, Cypripedium Maudiæ, C. Venus, and some cattleyas. Mr. Davis, gardener to J. E. Fowler, Esq., Southgate, set up a finely-flowered specimen of Masdevallia Schroderiana. From the Burford Lodge collection Mr. W. H. White brought up a large specimen of Dendrobium fimbriatum oculatum, carrying just over forty racemes of its golden, maroon-blotched flowers; a cultural commendation was deservedly granted.

DAFFODIL COMMITTEE.

Mr. Chas. Dawsõn, Gulval, Penzance, had a vastly interesting group of choice new daffodils, arranged on a high stand. Where all were so good it is difficult to particularise, but the rich yellow Buttercup (A.M.), White Slave, Pearl Diver—pure white in cup and perianth—Apache, Groff, Pilgrim, Ibis, Dorothy Kingsmill, Cygnet, Stara, and Ptarmigan attracted our attention. Messrs. Wm. Bull and Sons, Chelsea, showed daffodils, popular varieties, put up in rather close bunches. Messrs. R. and G. Cuthbert, Southgate, sent a few gently-forced tulips.

From Messrs. Cartwright and Goodwin, Blakebrook, Kidderminster, came a very pretty stand of beautiful daffodils, such as Rising Sun, Duke of Bedford, Aureole, Bullfinch, Gold Cup, Yellow Hammer, Marigold—an early rich incomparabilis, Mdme. de Graaff, Beauty, and Alice Knights. Mr. T. H. Chapman, Rye, Sussex, staged a small collection of daffodils, showing good blooms of King Alfred, Weardale Perfection, Mdme. de Graaff, Duke of Bedford, White Queen, and Glory of Nordwijk

Messrs. Barr and Sons, Covent Garden, displayed a collection of daffodils, in which Fireflame, Loveliness, Bedouin, Peter Barr, and King Alfred were good. The Messrs. Barr also had some good early Darwin tulips, and a collection of polyanthuses, squills, etc. Messrs. Pope and Son, King's Norton, Birmingham, exhibited a small set of daffodils, their flowers of King's Norton, Lady Margaret Boscawen, Lucius, and Boniface being particularly good. Sir Josslyn Gore Booth, Bart., Lissadel, Sligo, Ireland, set up a fine lot of daffodils in large bunches, conspicuous varieties being White Queen, Lady Margaret Boscawen, Sir Watkin, Glory of Leiden, Mrs. Robert Sydenham, and Victoria.

Miss T. W. Currey, The Warren, Lismore, Ireland, contributed a very attractive exhibit of Irish-grown daffodils. This was a large and bright display, and its chief features were Lady Margaret Boscawen, Mrs. Robert Sydenham, Goldfinch, Avalanche, The Warrior, Queen Sophia, White Queen, Scarletta, White Slave, Torch, Mdme. de Graaff, Lucifer, and King Alfred. Messrs. Jas. Carter and Co., High Holborn, were very large exhibitors; they had a display of florists' and stellate cinerarias, and a remarkable lot of blooms of the very fine King Alfred daffodil, set up in a very tasteful manner.

Messrs. Hogg and Robertson brought over a large exhibit of daffodils and tulips from Ireland. Their flowers were a little too stiffly bunched, but there were good blooms of Madame Plemp, Lady Margaret Boscawen, King Alfred, Glory of Nordwijk, Sir Watkin, Apricot, Lucifer, and Duke of Bedford daffodils. Tulips in pots, and cut flowers, as well as a modest display of daffodils, were arranged by Messrs. R. H. Bath, Lim., Wisbech; Duke of Bedford, Silver Spur, and Princess Mary were very good daffodils shown, while the scillas and chionodoxas were very fine.

FRUIT AND VEGETABLE COMMITTEE.

Dawes Challenge Rhubarb, a very strong-growing, brightly-coloured variety, was shown by Mr. T. E. Dawes, The Nurseries, Syderstone, Norfolk. A cultural commendation was worthily awarded. Mr. W. A. Cook, Leonardslee Gardens, Horsham, showed fairly well preserved fruits of Catillac pears and Profit, Winter Greening, Scarlet Pearmain, and Mere de Menage apples.

AWARDS.

Award of Merit.—Viburnum Carlesi, from Sir Trevor Lawrence, Bart., Burford Lodge, Dorking; Cyrtomium falcatum Mayi, from Messrs. H. B. May and Sons, Edmonton; Narcissus Buttercup, from Mr. Chas. Dawson, Gulval, Penzance; Cymbidium eburneum Goodsonianum, from Mr. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney.

MEDALS.

Gold.—Mr. G. Mount, Canterbury; Mr. Chas. Dawson, Gulval, Penzance.

Silver-gilt Flora.—Messrs. W. Cutbush and Son, Highgate; Miss F. W. Currey, Lismore, Ireland; Mr. Sanders, gardener to Alfred de Rothschild, Esq., Halton, Bucks.

Silver-gilt Banksian.—Mr. W. H. Page, Hampton, Messrs. Hugh Low and Co., Bush Hill Park, Enfield; Messrs. James Veitch and Sons, Chelsea; Messrs. Cartwright and Goodwin, Kidderminster; Sir J. Gore Booth, Lissadel, Ireland.

Silver Flora.—Messrs. H. Cannell and Son, Swanley; Messrs. H. B. May and Sons, Edmonton; Messrs. Wm. Paul and Son, Waltham Cross; Mr. J. R. Russell, Richmond; Messrs. Barr and Sons, Covent Garden; Messrs. Hogg and Robertson, Dublin; Mr. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney.

Silver Banksian.—Messrs. Paul and Son, Cheshunt; Mr. M. Prichard, Christchurch; Mr. W. A. Cook, gardener to Sir E. Loder, Bart., Leonardslee, Horsham; Messrs. James Veitch and Sons, Chelsea (orchids); Messrs. Hugh Low and Co., Enfield (orchids).

Bronze Flora.—Messrs. T. Cripps and Son, Tunbridge Wells; Mr. A. F. Dutton, Iver, Bucks; Mr. G. Reuthe, Keston, Kent; Mr. Charles Turner, Slough; Messrs. R. Wallace and Co., Colchester; Messrs. T. S. Ware, Lim., Feltham; Mr. C. F. Waters, Deanland Nursery, Balcombe, Sussex.

Messrs. W. H. and L. Collingridge, printers and publishers, of 148 and 149, Aldersgate Street, showed examples of the reproduction of water-colour drawings of flowers by the three-colour process. This formed a very interesting exhibit, as the original water-colour drawings were framed with impressions of the several printings employed to produce the finished results.

British Gardeners' Association (London Branch).

An interesting and exhaustive address was delivered by Mr. E. F. Hawes, of the Royal Botanic Gardens, Regent's Park, at the recent opening meeting of the newly-formed London Branch of the B.G.A., on the "Present Opportunities of Improving the Gardeners' Education in London." There was a large attendance at Carr's, and Mr. Frogbrook presided.

The lecturer dealt briefly with the circumstances leading up to the formation of the branch, and read over the objects of the association. Special attention was called to object (f): "The encouragement of a higher standard of education, and of greater professional efficiency amongst its members." He pointed out to those who desired to improve themselves the various means at command, and the advantages those resident in and around London possessed over the less fortunate workers in country districts. In the first instance he urged that the public parks and gardens in London are maintained at such a high standard of excellence, and provide fine examples of spring, summer, and autumn bedding, and are within reach of everyone's time and pocket to visit, such as are to be found in no other part of the world.

NARCISSUS BUTTERCUP.

Exhibited at the R.H.S. meeting, held on the 14th inst., when it received an Award of Merit. Flowers of medium size, and a rich golden colour.

The National Garden at Kew was not overlooked, and visits to it should be paid whenever possible, as there was always something of interest to be found in bloom, and no matter what season the visit took place there was much to learn there. The lecturer also pointed out that London gardeners are fortunately placed in the centre of great horticultural exhibitions, where one may keep in touch with the newer species and varieties of plants and flowers. Then there are the cheap and easily-reached evening classes at the various Polytechnics and evening schools throughout London, horticultural classes being carried out for the past two years at West Norwood Technical Institute, and during the past year specially at Lavender Hill for employees in the public parks. Besides gardening classes allied subjects were also mentioned, including botany, chemistry, and physics, geology, entomology, freehand drawing, etc.; and last, but not least, the necessity for clear caligraphy, a working knowledge of English composition, and simple arithmetic was enforced by the lecturer.

Mr. Hawes, recently elected chairman of the London Branch, also pointed out the advantages to be derived from visits to the various museums, and from a study of suitable books of reference on horticultural subjects, together with the weekly gardening periodicals.

At the close of the lecture some useful comments were made by members present, and it is hoped that similar meetings, held regularly, will prove of material assistance to members of the gardening profession in London.

Birmingham Gardeners' Association.

The last fortnightly meeting but one of the spring session was held on April 6. Mr. Walter Jones presided, and there was a goodly number of members present to hear a dissertation on "Alpine Plants and their Culture," by Mr. James Webb, gardener to William Byng Kenrick, Esq., Metchley House, Edgbaston. The Chairman, in introducing the essayist to the audience, testified to his energy and perseverance, and also his love for alpine plants, as evidenced when a foreman in the gardens at Maplebank House, Edgbaston, the residence of Mrs. Kenrick's parents, Alderman and Mrs. C. G. Beale, about two years ago.

Mr. Webb prefaced his subject matter with the remark that he had elected to treat upon those varieties of alpines he had had practical experience with. The subject was enhanced by the collection of plants he had brought to illustrate it, and amongst which there were several of a choice or rare character. He had also a small plant of a seedling arabis raised by himself, and named A. alpina variegata aurea compacta: its foliage is deeply incised, and it should make an excellent edging plant. The committee unanimously awarded it a Certificate of Merit.

Mr. Webb dealt with his subject in a thoroughly practical and lucid manner, and this was all the more creditable considering that it was the first lecture he had ever essayed to deliver publicly. An interesting discussion was evoked, and several of the speakers expressed their high appreciation of the way in which the subject had been treated.

Mr. C. R. Bick, The Bickenill Nursery, Olton, near Birmingham, brought an interesting collection of alpines in flower, and to which a Certificate of Merit was duly awarded. It should also be added that Mr. Webb brought photographs of the alpine rockery at Metchley House, which he designed and constructed himself.

Royal Horticultural Society of Ireland.

SPRING SHOW.

The annual show of the above society was held in the Royal University Buildings, Dublin, on April 8 and 9. For a second year in succession the committee laboured under the adverse influence of a late spring, and, as a consequence, the entries were again below the average, although the general excellence of the exhibits was equal to the usual high standard which is associated with the exhibition.

There is no doubt that daffodils are the backbone of the show, and that if they were not there it would lose one of its greatest attractions. Roses, both in pots and cut, were also very prominent features, and deutzias, azaleas, anemones, cinerarias, tulips, arum lilies, hyacinths, and hardy spring flowers were not forgotten.

An interesting feature of the two days' show was the lectures, which were given in the evenings. This year Mr. F. W. Moore lectured on Wednesday on "Plants and Points in their Culture," while on Thursday Professor Carpenter spoke about "Animal Life in the Garden."

On entering the building the visitor found himself in a large central hall, which was filled with plants of the starry cineraria, arum lilies, table decorations, foliage and flowering plant groups; while in the middle there was a large island of interesting things sent from the Royal Botanical Gardens at Glasnevin. Here were Adenandra speciosa, a hard-wooded plant with a flower which reminded me of a white cistus; Templetonia retusa, a clianthus-looking flower of a dull copper-red; Polygala gracilis, a shrubby plant of the milkwort order, with large purple flowers; three old-fashioned things that are not very commonly seen nowadays.

The cup for nine pot roses went to Mrs. H. P. Goodbody, of Blackrock, the second and third prizes of this class being taken respectively by Mr. Henry Dudgeon and Mr. H. Guinness. Mr. Edmund D'Olier's stand in the twenty-four class of cut roses was a fine exhibit, and Mr. Ernest Bewley was not far behind.

Lord Ardilaun, the president of the society, has again given a cup for the best collection of fifty varieties of narcissi. Mr. C. M. Doyne, of Wells, Gorey, who has taken this prize for the last six years, was once more successful. His flowers were in splendid condition, and nicely arranged, and included such varieties as Lady Margaret Boscawen, Duke of Bedford, Ariadne, White Lady, Seagull, Agnes Harvey (an especially charming Leedsi), Weardale Perfection, and Vesuvius. Mr. R. T. Harris was awarded the second prize for a nice clean lot of blooms, Sir Roger Palmer, Bart., being placed third.

Tulips made a bright bit of colour in the large room to the right of the central hall. Mrs. Goodbody was first in both the single and double tulips (pots) classes, Mr. D. Drimmie being second in the latter, and Mr. J. K. Laidlow second in the former. Lady Annaly, Miss Pim, Sir E. C. Cochrane, Bart., Captain Riall, R.N., Sir John Franks, Lord Plunket, Messrs. H. Dudgeon, E. A. Millar, and S. Cochrane are among the prizewinners in other sections.

The gallery round the central hall was largely taken up with the trade exhibits. Sir Josslyn Gore-Booth, Bart. (large gold medal), had a fine lot of daffodils from his Lissadell bulb farm. It is only four or five years since Sir Josslyn commenced bulb growing, but the flowers on his stand would have done an old grower great credit. Incognita was splendid, so were Oriflamme, C. J. Backhouse, Citron, Torch, Katherine Spurrell, Cassandra, and Golden Bell. The attendant in charge of the stand said that all the authorities at Lissadell thought this last would be one of the market flowers of the future. It is certainly very floriferous, and its handsome trumpet always takes one's eye. Incognita is a coming flower; it is terribly dear now, but time will rectify that, and then everybody will want to have it; it has a reddish-orange, much-flattened cup, which, on the light starry perianth, is exceedingly taking.

Messrs. Hogg and Robertson, Lim. (gold medal), had a good fresh lot of flowers. Their collection included Duke of Bedford (bicolor), King Alfred, Queen Bess (very good), Ariadne, Flambeau, Lady Doneraile (yellow self Magni), Autocrat, Orphee, Cernuus Plenus, Mrs. J. Thorley, and Golden Orb. It was interesting to compare these two groups, one from the East and one from the West of Ireland, and notice how much earlier the latter district is.

Messrs. William Watson and Sons had some beautiful floral designs; one novelty that created considerable interest was a wreath composed of dyed grevillea leaves. Messrs. Heath and Sons, of Cheltenham (gold medal), had a large and varied exhibit, consisting of winter-flowering carnations, orchids, rock plants in pots, and a good collection of the now popular scented geraniums.

Messrs. E. Browett and Sons (silver medal) had a rather stiffly arranged bank of palms, ferns, and foliage plants, with a few azaleas to brighten it up. Messrs. Charles Ramsay and Son (gold medal) had a group of roses, carnations, and flowering and foliage pot plants, backed with palms. Anemones were shown by Messrs. Orr White (medal), and cut roses by Mr. E. Bewley (gold medal).

Bristol Gardeners' Association.

A well-attended meeting was held at St. John's Parish Rooms, with Mr. C. H. Cave in the chair. The meeting was of exceptional interest, being the official visit of the Bristol amateurs. The subject for the evening was "Chrysanthemums," by Mr. Harris, a well-known and successful grower of these autumn-flowering plants. He gave his own practical experience, and explained that chrysanthemums should be well grown from the cutting stage to the time of flowering. Mr. Harris gave instructions as to potting, compost, pinching, and taking the bud, and recommended that to grow chrysanthemums well they should at their final shift be put into twelve-inch pots. Mr. Lee opened the discussion, and followed by Messrs. Curtis, Binfield, Garnish, Morse, Clark, Harford, and House. Mr. Hayball proposed, and Mr. Shelton seconded a vote of thanks to the lecturer. For six varieties of daffodils (prizes given by C. H. Cave, Esq.), Mr. Binfield was first, Mr. Scott second, and Mr. Clark third. Special certificates were awarded to Mr. Spry for three pots of mignonette; to Mr. Hunking for Lælio-cattleya Felicity; and Mr. Curtis received an ordinary certificate for Dendrobium nobile nobilis.

East Anglian Horticultural Club.

In spite of the fact that April is a busy month in the garden, there was a large gathering at the April meeting of this club, held at the Boar's Head Hotel, Norwich, on the 8th inst. Several new members were proposed, and Mr. W. L. Wallis (secretary) announced that over 30 new members had been enrolled this year. A fair display of flowers, fruits, and vegetables were placed upon the exhibition tables, and created much interest. Messrs. Hobbies, Lim., Dereham, sent some choice pot roses; Mr. T. B. Field brought up some grand flower heads of clivias; Mr. S. Hunt, gardener to Mrs. Willis, staged a profusely-flowered specimen of the mauve soldanella; Mr. C. Burtenshaw showed how to keep apples, his Cox's Orange Pippin being very firm; strawberries of exceptional colour and flavour were staged by Mr. W. Palmer, Thorpe; and Mr. F. Williams, gardener to Louis Tillett, Esq., M.P.; orchids had a good champion in Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., and there were, besides these, many others.

A paper written by Mr. H. B. Dobbie, Ditchingham, was read by Mr. H. Perry, Mr. Dobbie's health not permitting him to attend. The subject of the essay, "The Earth's Vegetation," seemed a most stupendous one to attack. However, the essayist tackled it in a very understandable way. He went back far into remote periods, relying upon geological information for support of his theories. The rapidity of the multiplication of one-celled organisms, to show how vegetation grew, was well put. The subject seemed, however, to be somewhat beyond the debating powers of the general members. Messrs. T. B. Field, J. Powley, E. Peake, H. Goude, H. Perry, T. G. Bishop, and J. C. Abel were the chief speakers.

NOTES OF OBSERVATION.

Solomon's Seal.—In winter time, when anything in the way of greenery for mixing with cut flowers for room decoration is most acceptable, I know of nothing so useful or more pleasing than Solomon's seal. Its cultivation is simple in the extreme, as it needs but little care and attention, compared with some other less useful plants. Planted in the open, on deeply worked beds, with a liberal addition of well-decayed manure, or, if the soil is heavy, lightened with leaf-mould, etc., they quickly grow into strong forcing plants. If a goodly number are wanted now that the young growths are shooting above the ground, they may be lifted, divided, and at once planted. A good plan, too, to increase these plants, is by way of reserving the basal portions of the rhizomes when lifting for forcing. Healthily grown plants, when forced gently, and which have been potted into six-inch pots, will be found very useful for intermixing with plants in stands, or in the conservatory. The delicate pale hue of the leaves, and the graceful habit of growth makes the plant admirable for such purposes.—H. Markham, Wrotham Park Gardens.

Early-Flowering Chrysanthemums, if sufficiently advanced, and well hardened off, may now be planted, and old plants that have survived in their winter quarters may be lifted, divided, and re-planted, insuring a good supply of roots to each piece. Old pot-grown plants that have been kept through the winter may be treated in same way. There are now so many good varieties of these, and they are so very useful and helpful for furnishing summer and autumn displays, that no garden should be without them. A few good varieties are Mychett White, Lady Fitzwygram, White Quintus, White Masse, King of the Earlies, Roi des Blancs, Market White, Mrs. A. Willis (yellow), Mychett Beauty, Orange Masse, Maggie, Horace Martin, Glow, Goacher's Crimson, Jeanie, Beacon, Roi des Precoces, Ruddigore, Kuroki, Pearlie, Mdlle. Marie Masse, Mabel, Gertie, Goacher's Pink, James Bateman, Harvest Home, Cactus, Beauty, Betty, H. H. Crane, and Rabbie Burns. The list might be greatly extended, and each year sees further acquisitions arrive. These may be planted either in beds or masses, or at intervals in the borders and beds. If grown entirely for cutting purposes they may be planted where the floral display has not to be considered; well dress the ground with thoroughly decayed manure, and deeply dig it in, then make the ground firm before planting, and plant about two feet apart each way, except for the dwarfer-growing [illegible] which may be eighteen inches apart.—[illegible] Hazelton, Knowsley Gardens, Prescot.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

RED SPIDER ON GOOSEBERRY BUSHES. — W. C., Loughton: Spray the bushes with a quassia or nicotine solution, adding a little soft soap to make the insecticide slightly adhesive. As soon as the berries begin to swell rapidly, cease the use of insecticide, but continue to syringe the bushes frequently with clear water if there are still evidences of red spider. Directly warm weather sets in mulch over the root area of the bushes with half-decayed manure.

DAMAGED ROSES.—W. T., Walsall: We believe the damage done to the protected roses is due to the use of fresh strawy litter as protective material. Straw saturated with urine would, if at all closely packed, ferment, and this fermentation would certainly harm the growths, especially those made by rank-growing varieties, and which would not be well ripened last autumn owing to the absence of sunshine and warmth. In future use only old clean straw or bracken for proprotecting your roses. You could not have done better than cut the damaged plants hard back.

DISEASED CHRYSANTHEMUMS. — W. B., Clewer: The leaves show traces of the common Chrysanthemum Rust, but there is a state of collapse about them that is not due entirely to this fungus. An over-rich soil, excess of water, or even too warm a position followed by a sudden fall of temperature, would in some measure be answerable for such a collapse, and the latter would be very likely to be the cause if the plants were newly potted; there is mildew present, and this lends further evidence to the supposition. Remove the affected leafage, and spray with weak sulphide of potassium solution. Isolate the diseased plants as far as possible.

HORTICULTURAL EXAMINATIONS.—M. F., London: An examination is held annually by the Royal Horticultural Society for gardeners employed in the London and other public parks and gardens, and the examination is partly written and partly viva voce. A certificate gained at these examinations gives the owners thereof a considerable advantage in the case of the parks and gardens administered by the London County Council. If you decide to sit for the examination next year we would advise you to commence the work of preparation at once. By commencing thus early and working systematically, you will be able to thoroughly ground yourself in the several subjects without unduly taxing yourself. Candidates are expected to have a knowledge of: 1. Trenching, digging, and draining; and the purpose of each. 2. Variety of soils and manures; their effect and suitability to various purposes. 3. Grass land: renovation, turfing, relaying; grass edges; grass under trees. 4. Various methods of propagating trees and shrubs, herbaceous, greenhouse, and sub-tropical plants. 5. Trees, plants, and shrubs specially suitable for town growth, and their correct nomenclature. 6. The general structure of plants. 7. Such elementary drawing as will assist in the formation of beds and their laying out. 8. Works and estimated expenditure on roads, paths, stonework, rockwork, fences, lakes, bridges, seats, etc. 9. Candidates will also be expected to display evidence of general knowledge and observation, and to be able to write an intelligent report on any subject connected with their work. In preparing for the examination, thoroughly ground yourself in the several subjects to ensure the knowledge being of service to you in your work. It would be an advantage were you to obtain from the society a copy of the questions set at the last examination, and from time to time answer two or three without the aid of book or notes. This will be excellent practice, and the training you have undergone will be of great assistance to you in the examination room, where so many candidates fail owing to their inability to answer the questions clearly and concisely.

NAMES OF PLANTS.

J. D. C., Cobham.—1, Pinus Pinaster; 2, a variety of Picea excelsa.

G. D. R., Durham.—1, Anemone apennina; 2, Berberis aquifolia; 3, Ada aurantiaca.

C. H. W., Derby.—1, Orobus vernus; 2, Clematis indivisa lobata; 3, Davallia pentaphylla.

S. E. B., Woking.—1, Libocedrus decurrens; 2, Abies Nordmanniana; 3, Cupressus macrocarpa; 4, Retinospora squarrosa.

P. J., Gloucester.—1, Olearia Haasti; 2, Kerria japonica fl.-pl.; 3, Saxifraga apiculata; 4, S. cæspitosa rubra; 5, Sedum acre aurea.

A. G. G., Gaddesdon.—1, Pelargonium glaucifolium; 2, P. fragrans; 3, P. heraclifolium; 4, P. crispum; 5, P. radula; 6, not recognised; 7, P. quercifolium; 8, Gesnera cardinalis; 9, not recognised, please send a bit of growth with a flower; 10, Acacia armata.

CARE OF GARDEN TOOLS.

The notes written on this subject by Mr. H. C. Prinsep have been of much interest to me, and I should like to say that if the gardener's position is to be improved it seems very evident to me that the care of tools and the general tidiness of the garden are matters that must receive careful and strict attention. However good a cultivator a man may be, if he is untidy or slovenly in his methods he cannot expect to gain the approval of his employer. I am aware of the great difficulty that one has to contend with in the matter owing to the scarcity of labour in many gardens, the number of hands in many cases being wholly inadequate to maintain the gardens in the high state of excellence in which many hard-working, conscientious head gardeners would delight in keeping them.

There is, however, no excuse for leaving tools about the garden, or in the greenhouses or other glass structures. The conservatory may be filled with beautiful plants, artistically arranged, but if a sponge, scrubbing-brush, or water-pot has been carelessly left in view, this is sure to give annoyance, and the whole effect is marred. The same thing holds good throughout the whole of the garden and grounds. There is a tendency in these days for young gardeners to feel "above" doing certain work, such as sweeping out a shed, washing, or even crocking a few pots, preferring to wait until the "garden boy" is at liberty, or else leaving the work undone. If these young gardeners ever fill the position of head gardeners, they will find few operations at which they will not have to "lend a hand." I will not close this note without a word of praise to the many hardworking and thoughtful young men one meets with in the profession. These men, who give their minds to the work in which they are engaged, and are ever ready to do whatever is required of them, will not fail to obtain a good position. In the position to which they attain they will not fail to do their best, and thereby assist materially in raising the "status of the gardener."

National Primula and Auricula Society at the Royal Horticultural Hall.

WEDNESDAY, April 29.—Royal Society of Arts.
School Teachers' Examination in Horticulture at the Royal Horticultural Hall.

Raising Choice Sweet Peas.—Some of the novelties have been so extremely difficult to obtain this season that it becomes the lucky possessors of them to be more than usually careful in the sowing. Personally, I believe there is no system to beat that of sowing one seed in a small pot, and keeping the pots in a greenhouse until germination is well assured. The sweet pea is, of course, hardy, and germinates as well in the open garden as in the greenhouse, but in the latter place one has the plants or seeds under such absolute control, and is able to snap the fingers at insect pests. I do not believe in keeping the young plants under glass too long, and would advise shifting them to a cold frame as soon as their existence is clearly demonstrated by the appearance of the first pair of true leaves.—E. J. K.

NOTES OF THE WEEK.

Nature's Vagaries.

Although it may be presumed that the term "vagaries" is open to challenge by the strict evolutionist, on the ground that all natural phenomena are due to definite laws, and that the apparent exceptions are only so by reason of our ignorance, yet certain phenomena present themselves in such eccentric and unaccountable forms as humanly to justify the expression. In the first rank of such vagaries we must, of course, put all marked sports, whether animal or vegetable. So far as evidence is concerned, the specific form has been adhered to from time immemorial. Generation has followed generation with nothing appearing in the way of variation beyond those small individual peculiarities common to all complex organisms, and then quite suddenly, and without any previous indication or gradation, an individual appears with quite, and it may be, very distinct, characteristics of its own, which it is impossible to attribute to reversion or any other known cause. As a rule, the alteration is persistent, and is inherited by future offspring. The change may present no advantage at all in the struggle for existence, it may even be a handicap, unless, indeed, it prove attractive to man, and becomes, therefore, artificially fostered, propagated, and preserved. Left to Nature, she is just as likely as not to destroy it eventually by the agency of its better-fitted neighbours of its own or other kindred. In Nature there is no favouritism accorded to novelty unless the novelty in itself is armed to fight its own battle. With man's aid it is otherwise; since he came in as a selective factor, a vast number of variations have been preserved and protected when they have appealed to his taste or contributed to his needs. Few, indeed, of the food plants, cereals, fruits or vegetables, are wild unsophisticated forms. With flowers, although many wild species are under culture, the great bulk of those which enrich our floral exhibitions are the results of selective culture from the "vagaries" which form our text. In the animal kingdom it is the same, cattle, sheep, horses, dogs, pigeons, etc., may all be cited as affording examples, the last-named two, pigeons and dogs, presenting perhaps the greatest dissimilarity between individuals, and appealing to the idea of "vagaries" most eloquently of all. It may be argued that most of the types have been arrived at by selecting and accumulating minor variations in definite directions; but when we see such a type as the turnspit dog, and know that a precisely similar elongation of body and shortening of legs has occurred in both cattle and sheep by sudden sports, we appreciate at once that the most distinct forms may occur without any gradation at all, on the "vagary" principle. To the biologist, indeed, any distinctly marked departure, however small, from parental or ancestral form, is as interesting as the extreme cases. It is purely a question of degree. Something must have occurred to upset the normal equilibrium of the cells which build up the parents, and continue the chain of existence by forming the seed, which is part and parcel of the parental body, and is only differentiated when cross-fertilisation occurs, and there is a consequent combination of two parental forces. Given, however, that both parents are of the same species and normal, there is nothing here to induce departure from the long-established routine of true inheritance of type. With hybrids, of course, we have nothing to do in this connection; if man steps in and manages to form bizarre alliances which Nature abhors, the bizarre results cannot be laid to her charge, except in so far as by some occult means she has aided and abetted the hybridiser by contriving the compromise between the conflicting reproductive forces, which results in the composite offspring. Here, however, she usually draws the line by barring the succession. The laws which underlie and determine the results of simpler combinations, i.e., between differently characterised varieties of one and the same species, or between closely allied species, are gradually becoming clear, thanks to Mendel's experiments and those of his disciples, but those which determine asexual sports or seeming vagaries belong to another category, of which we have so far not the slightest knowledge, none of the theories so far advanced having stood the test of experience or been supported by substantial evidence.

MR. H. B. WITTY.
Superintendent of the Public Parks, Cemeteries, and Recreation Grounds, Kingston-on-Hull.

Mr. H. B. Witty has accomplished so much by his taste and skill in beautifying the parks, cemeteries, and other open spaces within the city and county of Kingston-on-Hull, that it gives us much pleasure to present our readers with his portrait and make some reference to his work. As in the case of other practical horticulturists who have been successful in obtaining a foremost position, Mr. Witty had a thorough training in his earlier days, and since passing through the preparatory stage of his career has been assiduous in the utilisation of the knowledge gained therein and subsequently acquired. Commencing his career in a well-organised nursery, he remained in the establishment four years, and passed through both the indoor and outdoor departments. Deciding to pursue public service, Mr. Witty went to Kew, where he quietly and diligently made the most of the opportunities the Royal Gardens offer for the acquisition of knowledge, and on leaving received a certificate of the most satisfactory character. Within a comparatively short period of leaving Kew he was appointed to the post of superintendent of the New Western Cemetery at Hull. Here Mr. Witty soon gave evidence of his ability, and among other things he initiated an extensive system of floral embellishment which gave the cemetery a park-like appearance and rendered it far more attractive than such spaces usually are. This exemplification of good taste coupled with business capacity was evidently much appreciated by the city council, for when the post of superintendent of the parks became vacant some years ago Mr. Witty was unanimously appointed thereto, and also placed in charge of the cemeteries, the grounds of the hospitals, and, indeed, of all the horticultural work of the city, these duties involving the management of many thousands of trees in the streets. Under his charge the floral arrangements of the parks and other open spaces have been extended and improved and stimulated by the liberal encouragement given him by the Parks Committee. Mr. Witty has succeeded in making the parks and cemeteries of Hull models of what such open spaces should be. Not only are tender plants remarkable for the beauty of their flowers or foliage fully utilised, but large collections of alpines and herbaceous plants have been formed, and the rockeries devoted to the former and the borders occupied by the latter constitute features at once remarkable for their interest and beauty.

Daffodils at Eaton Hall.—On Wednesday and Thursday last the gardens of Eaton Hall, Chester, were, by the kindness of the Duke of Westminster, opened to the public to enable them to see the beautiful display of daffodils.

Gardens Round about Bristol.—In our issues of May 16 and 23, we propose to describe and illustrate a number of the beautiful gardens that abound in and around the famous western city of Bristol.

Improvements at Sandringham.—During the terrific gale that swept over the greater part of England some weeks since, much damage was done to the trees growing in the park and grounds at Sandringham. The fine avenue of elms and limes leading from the beautiful Norwich gates to the principal entrance to the house was practically annihilated, for so large a proportion of the trees were blown down that it was decided to fell those that had escaped injury. The destruction of the avenue exposed the mansion to public view from the main road, and it was originally decided to remove the Norwich gates from the site they have so long occupied to a position near the kitchen gardens. The plans, that had been provisionally approved by the King, included the replanting of the avenue that had been swept away, the formation of a new avenue, and the continuation of the tall wall over the present site of the Norwich gates. The King having bestowed Sandringham on the Queen, His Majesty deferred his final decision until the Queen had had an opportunity of giving the plans full consideration. This Her Majesty did when she paid a short visit to Sandringham a fortnight since. After an examination of the plans and of the ground, which had been carefully staked out, the Queen made several important suggestions which necessitated a complete change in the proposed alterations and the preparation of more comprehensive plans. On the 18th inst. the King, accompanied by Lord Redesdale, and attended by General Sir Dighton Probyn and Major G. Holford, visited Sandringham for the purpose of examining the revised plans on the ground before finally approving of them. These plans are a great improvement on those originally prepared, and will give a much better approach to Sandringham than would have been obtained had the latter been carried out, excellent as they unquestionably were. The Norwich gates will be removed from the position they now occupy, but instead of being re-erected contiguous to the kitchen garden they will be transferred to the centre of the Dersingham avenue, some three or four hundred yards to the north of where they now stand. In carrying out this alteration a part of the Dersingham woods, which are now outside the Sandringham grounds, will have to be brought within their boundaries, and the main road that now passes the Norwich gates will have to be diverted for a few hundred yards.

The Ghent Centenary Exhibition.—The great international exhibition with which the Société Royale d'Agriculture et de Botanique de Gand will celebrate its centenary, has the promise of proving in every respect a magnificent success. The entries are so numerous as to be nearly double those of the most successful of the Ghent quinquennial exhibitions held under the auspices of the society, and the number of exhibitors are 400, as compared with 300 at the quinquennial held in 1903. The jury includes nearly 250 members, comprising the leading horticulturists and botanists in Europe and America, and the honorary president-general is Lord Redesdale, and the president-general is M. A. Viger. The vice-presidents-general of the jury are Major Holford, Baron de Grancy, Dr. Wittmack, and Messrs. H. J. Veitch, N. Bernard, A. Truffaut, R. de Beerenbroeck, Max Kolb, C. Radaelli, E. Rovelli, F. Lambeau, and Cartuyvelo. The secretaries-general of the jury are Messrs. Phillip de Vilmorin, Abel Chatenay, Victor Lemoine, Siebert, R. Seidel, R. W. Ker, and Correvon. The exhibition will be opened by the King of the Belgians to-day (Saturday), at 9.30 a.m. The railway station will be decorated with plants and flowers during the continuance of the exhibition, and the tram cars will be decorated with natural flowers and foliage. In the decoration of the cars upwards of 6,000 feet of garlands will be used. The exhibition will be opened to the public at 11 a.m. to-day (Saturday), and will continue to May 3. The comprehensive character of the exhibition will be sufficiently indicated by mention of the fact that the schedule contains 760 classes arranged in 28 groups. We shall give a full report, with illustration, of this great exhibition and the functions associated therewith in our issue for May 2.

Mr. Joseph Cheal, of the Lowfield Nurseries, Crawley, has recently returned from a short visit to Morocco, and his impressions of the country through which he passed and of the points at which he touched on his voyage would form most interesting reading. When at Casa Blanca Mr. Cheal was within sound of the guns that were being fired during an engagement between the Moors and the French troops, and he also had an opportunity of seeing several good gardens, where dates, figs, almonds, and other fruits were growing in abundance, but much of the land thereabouts is covered with broom and other scrub. Mr. Cheal had an opportunity of landing at Santa Cruz, and was much impressed by the extent and success with which potatoes and tomatoes are cultivated for the British and other European markets in the Island of Teneriffe. He was not less interested in banana culture in the Canary Islands, and the skill displayed in the irrigation of the plantations, and in the wealth of flowers and foliage at Funkel. At the last-named place he found palms and tree ferns in abundance, pelargoniums in variety spreading over the rocks, and producing a brilliant display of colour, and verandahs and pergolas clothed with allamandas, bougainvilleas, passifloras, and tacsonias.

New and Rare Orchids for Kew.—We learn with pleasure that Kew is indebted to the Honourable Walter Rothschild, F.L.S., of Tring Park, Tring, for a valuable donation of orchids, including a number of species not previously represented in the national collection. The donor has been an enthusiastic collector and grower of orchids for many years, and his interest was extended to species of purely botanical importance as well as to those possessed of attractions of a popular character. Consequently the Tring collection was reputed for the number of rarities it contained. Among those presented to Kew are the following: Bulbophyllum Binnendijkii, B. Ericssoni, B. Reinwardtii, B. virescens, B. parvimentatum, Cirrhopetalum Rothschildianum, C. biflorum, Ancistrochilus Rothschildianus, Angræcum Rothschildianum, Lissochilus giganteus, L. Horsfalliae, Eulophiella Peetersiana, Mormodes badium, Masdevallia sororcula, and M. deorsa. In addition to orchids various other plants were presented, including large masses of several species of Doryanthes, specially imported from Queensland, and some interesting aroids.

Vegetables of Foreign Growth were, in March, less plentiful than in the corresponding month of the past two years, and were it not for the big increase in the imports of potatoes our indebtedness to growers beyond the boundaries of the United Kingdom would have shown a substantial reduction. The imports of potatoes amounted to 606,727 cwt., against 160,647 cwt. in March, 1907, and 51.878 cwt. in the corresponding month of 1906. Of this quantity 83,425 cwt. were received from Germany, 283,692 cwt. from France, 1,431 cwt. from Channel Islands, and 238,179 cwt. from other countries. The value of the potato imports was £129.675, or an increase of £88.581. The imports of onions dropped from 703,724 bushels in March, 1907, to 559,325 bushels last month, the value of the latter being £63.919. The imports of tomatoes were considerably less in March than in the corresponding month of the two previous years, the total having been £86,928 cwt. of the value of £69.722. In the imports of unenumerated vegetables there was a material decrease, the value being £37,730, or £11,724 less than in the corresponding month of 1907.

Primrose Day was on Sunday last observed in accordance with the custom that has obtained since its institution. Primroses were generally worn in London, and the late Lord Beaconsfield's statue at Westminster was profusely and tastefully decorated with them, and with other flowers.

CLEMATIS MONTANA AS A STANDARD.

Within recent years we have given several illustrations of the elegant Clematis montana for the purpose of showing its suitability for clothing wall spaces, trailing over rustic trellises and arbours, draping fences, and running riot over the trunks and branches of dead or dying trees of moderate size, and we have good reason to believe that they have proved useful to our readers. We have now the pleasure of illustrating another way in which this charming climber may be utilised in beautifying gardens, whether small or of large size. The illustration of a specimen growing in a southern garden indicates the distinctive characteristics of a well-grown standard specimen, and it is not difficult to see that when such specimens are in bloom they add greatly to the charm of that portion of the garden in which they have a place.

There would be no great difficulty in producing well-developed specimens with the aid of a stout stake and a few rods of less diameter; but as wood is liable to decay somewhat rapidly within a short distance of the surface of the soil, and durability is a matter of considerable importance, iron should, as a rule, be used as a support for the growths. Two or three years are necessary for the production of well-furnished specimens, and it is very disappointing to have them blown over as soon as they have reached a really effective stage. Specimens ranging from 7ft. to 8ft. in height are preferable, and the most simple method of providing supports will be to obtain stout iron stakes with strong prongs, and when fixed firmly in the ground fit them with heads about 3ft. or so in diameter. The head may be formed with a ring of iron of the desired diameter and two cross-pieces, these latter being so fixed to the stake as to prevent any shifting of the head when the growths are trained over it.

It would be more advantageous to use for each specimen one of the tall iron supports with umbrella head, such as are manufactured for the training of rambling roses as single specimens. Supports of this description are so far superior to ready-made contrivances as to more than balance the additional cost. With such aid the formation of good specimens will be a comparatively easy matter, and provided the trainers are of sufficient strength to resist the effects of the strongest gale, they may be maintained in the best possible condition for a long period. As a matter of course, it will be necessary to enrich the soil as may be found necessary by means of a dressing of some good artificial fertiliser. This may be sprinkled over the surface as far as the roots are likely to have extended, and be well watered in, or a liberal supply of liquid manure of moderate strength may be given. The latter may be applied two or three times during the spring and summer with advantage. Excessive luxuriance is not desirable, and therefore no manurial matter will be required as long as the plants continue to make a vigorous growth and bloom satisfactorily.

Everyone interested in a garden should obtain a copy of the Alphabet of Gardening, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price 1s. 6d. net, by post 1s. 9d.; cloth, 2s., by post 2s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

LACHENALIAS.

Lachenalis are beautiful easily grown Cape bulbs, which succeed under conditions similar to that accorded the majority of greenhouse plants, a fact which brings them within practical reach of every amateur. The flowers, which are bell-like, are borne in racemes upon erect spikes some nine or twelve inches in height. In a general way they are not unlike our native wood hyacinth, except in colour, which, in the majority of species is bright orange or yellow, while one or two have reddish-coloured flowers. The foliage is bright green and strap-like, often spotted, and occasionally tinted with purple.

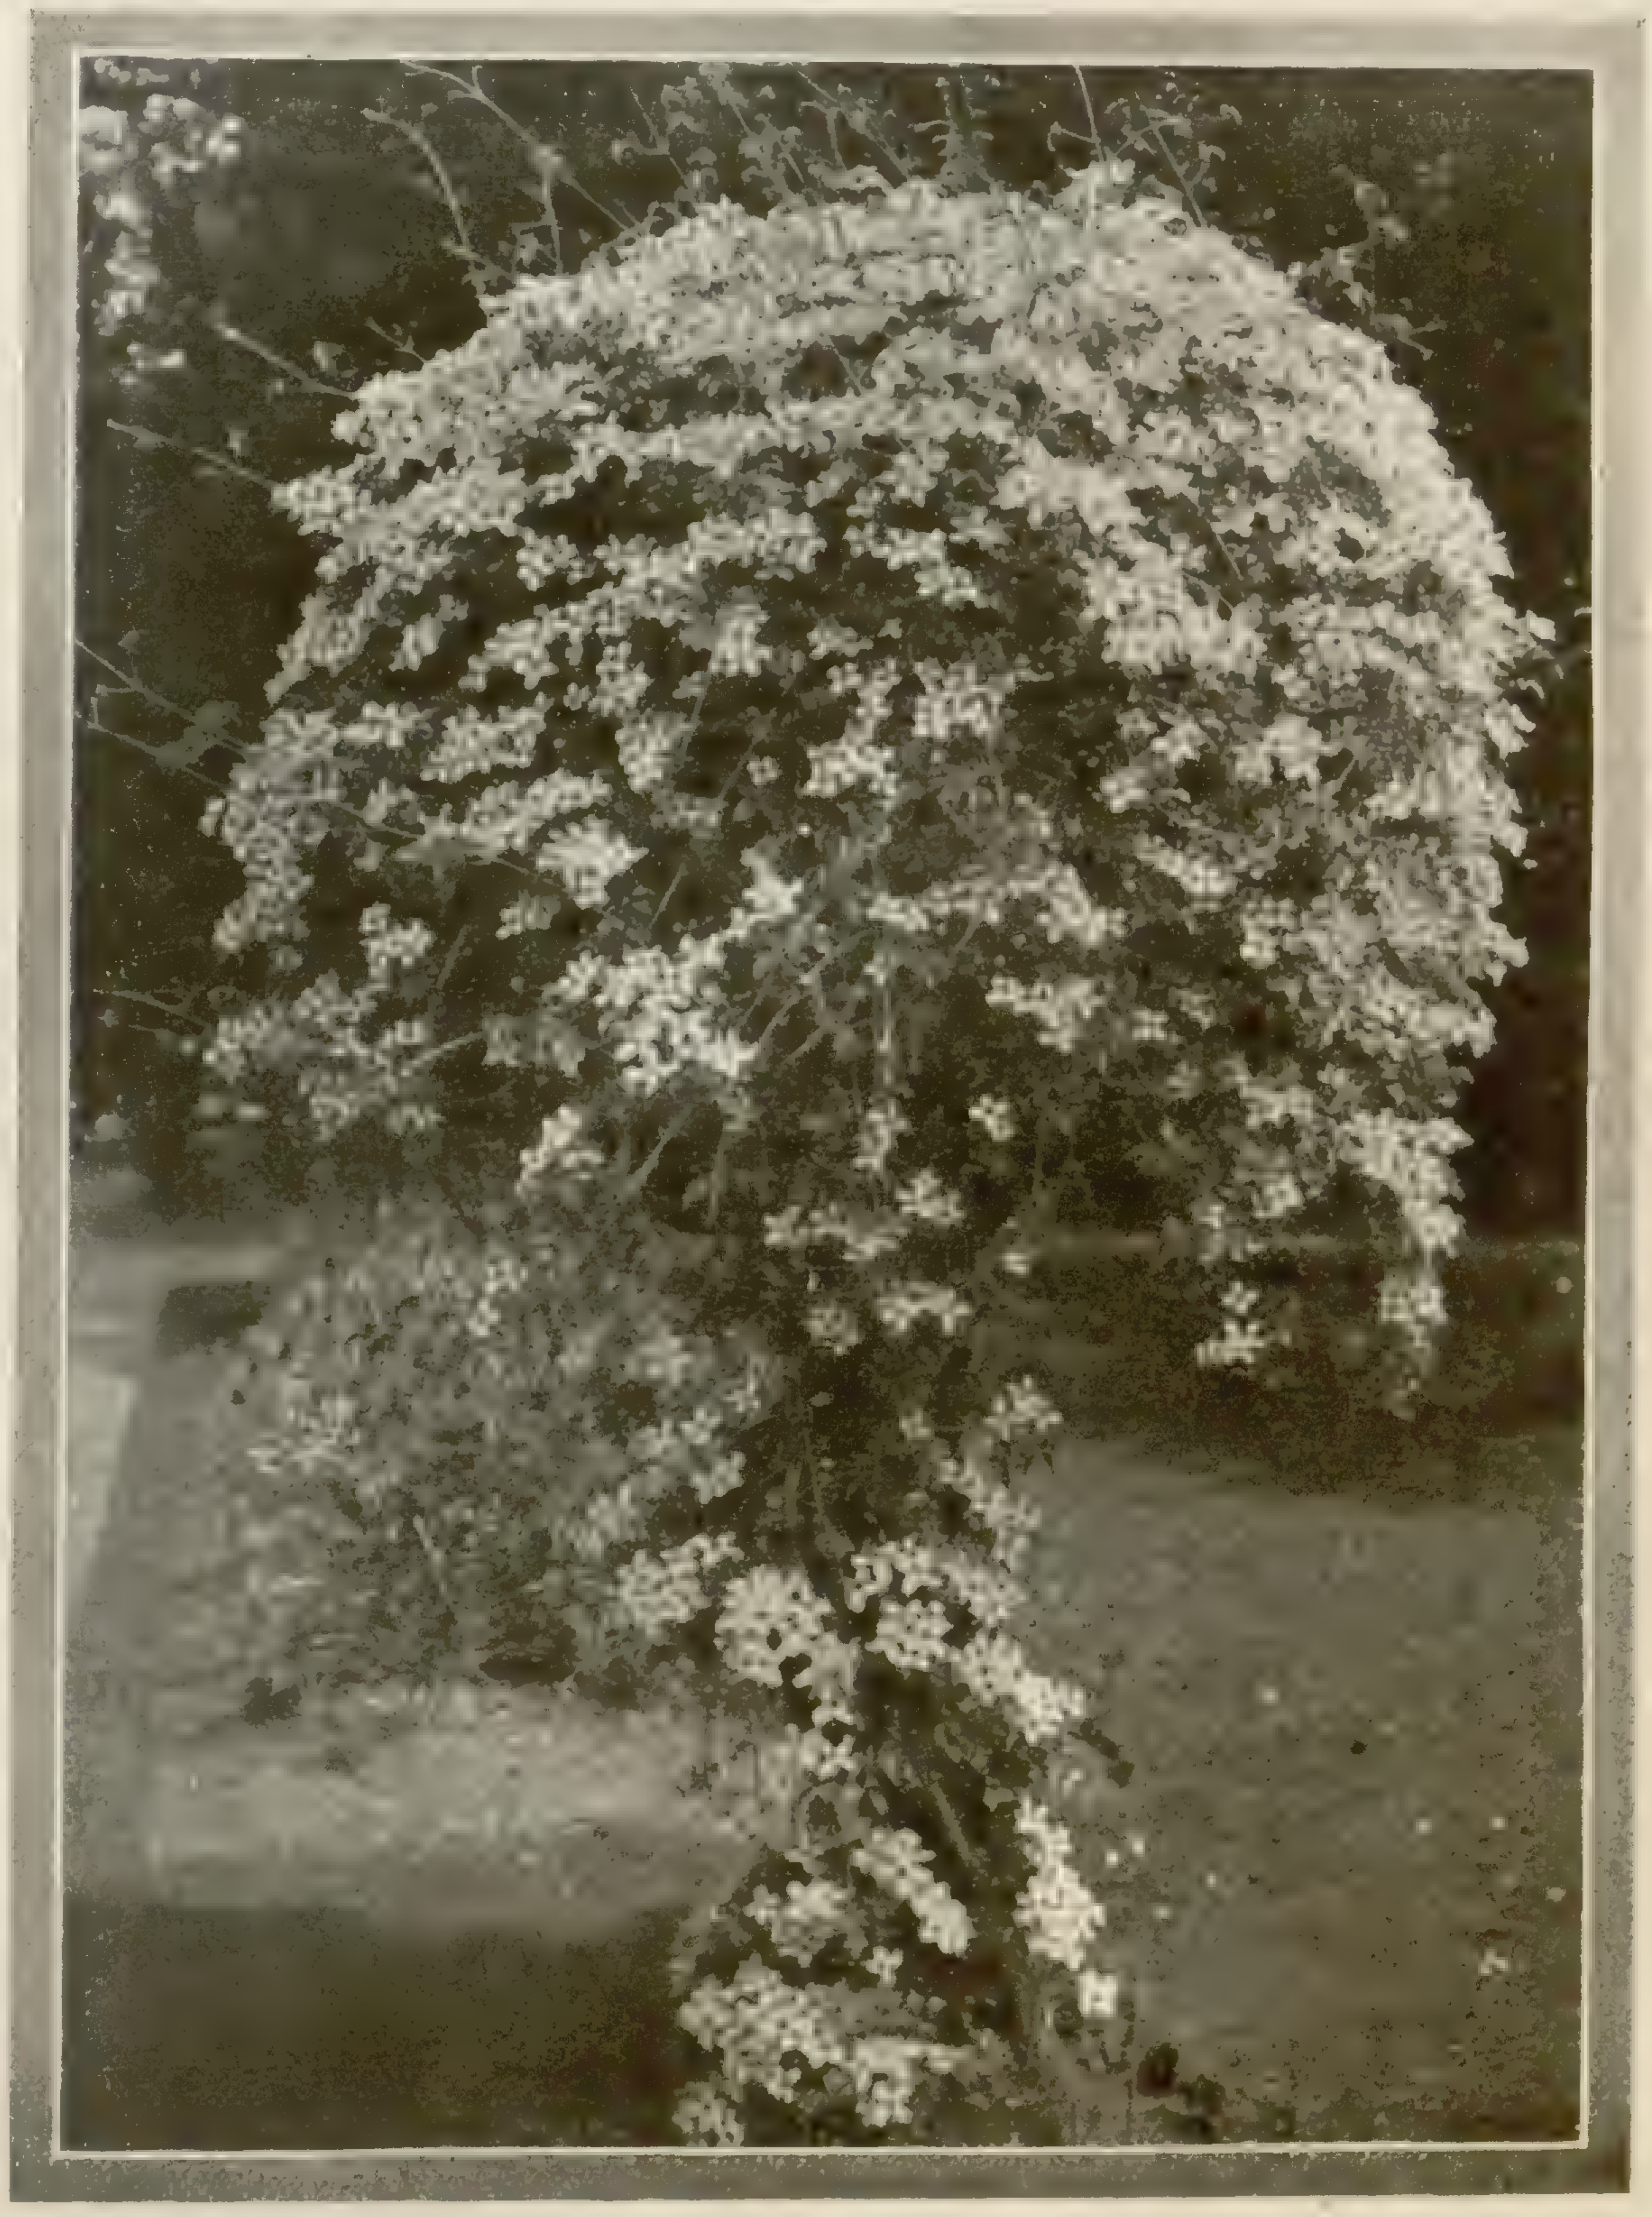
Lachenalias may be grown either in pots, pans, or hanging baskets, the latter method yielding most effective specimens. A suitable compost consists of loam, leaf-soil, and thoroughly decayed manure, employing sufficient sand to keep the whole open; free drainage must be provided, and the bulbs are potted during August and September, thereby admitting of batches to flower in succession. Six or eight bulbs in 5½in. pots, with a corresponding increase when employing pans or baskets, will form suitable specimens; after potting the pots are stood on a coal-ash bottom in cold frames, or plunged in cocoanut fibre refuse until growth commences.

Throughout the winter they are grown in any frost-proof structure, with full exposure to sun, and as the days lengthen choose an open position in the greenhouse, where they will come naturally into flower by the sun's agency alone. As soon as the spikes have developed and the flowers show signs of colour they can be transferred to living rooms, which they effectively brighten, lasting in flower for a considerable time.

After flowering the plants must be thoroughly ripened by full exposure to sun, water being gradually withheld as the foliage begins to ripen, and when all evidence of leaves has gone the soil may be allowed to bake dry in a cold frame until potting-up time comes round again.

Amateurs who are successful in growing freesias may embark in the culture of lachenalias with every confidence of success, their wants being similar.

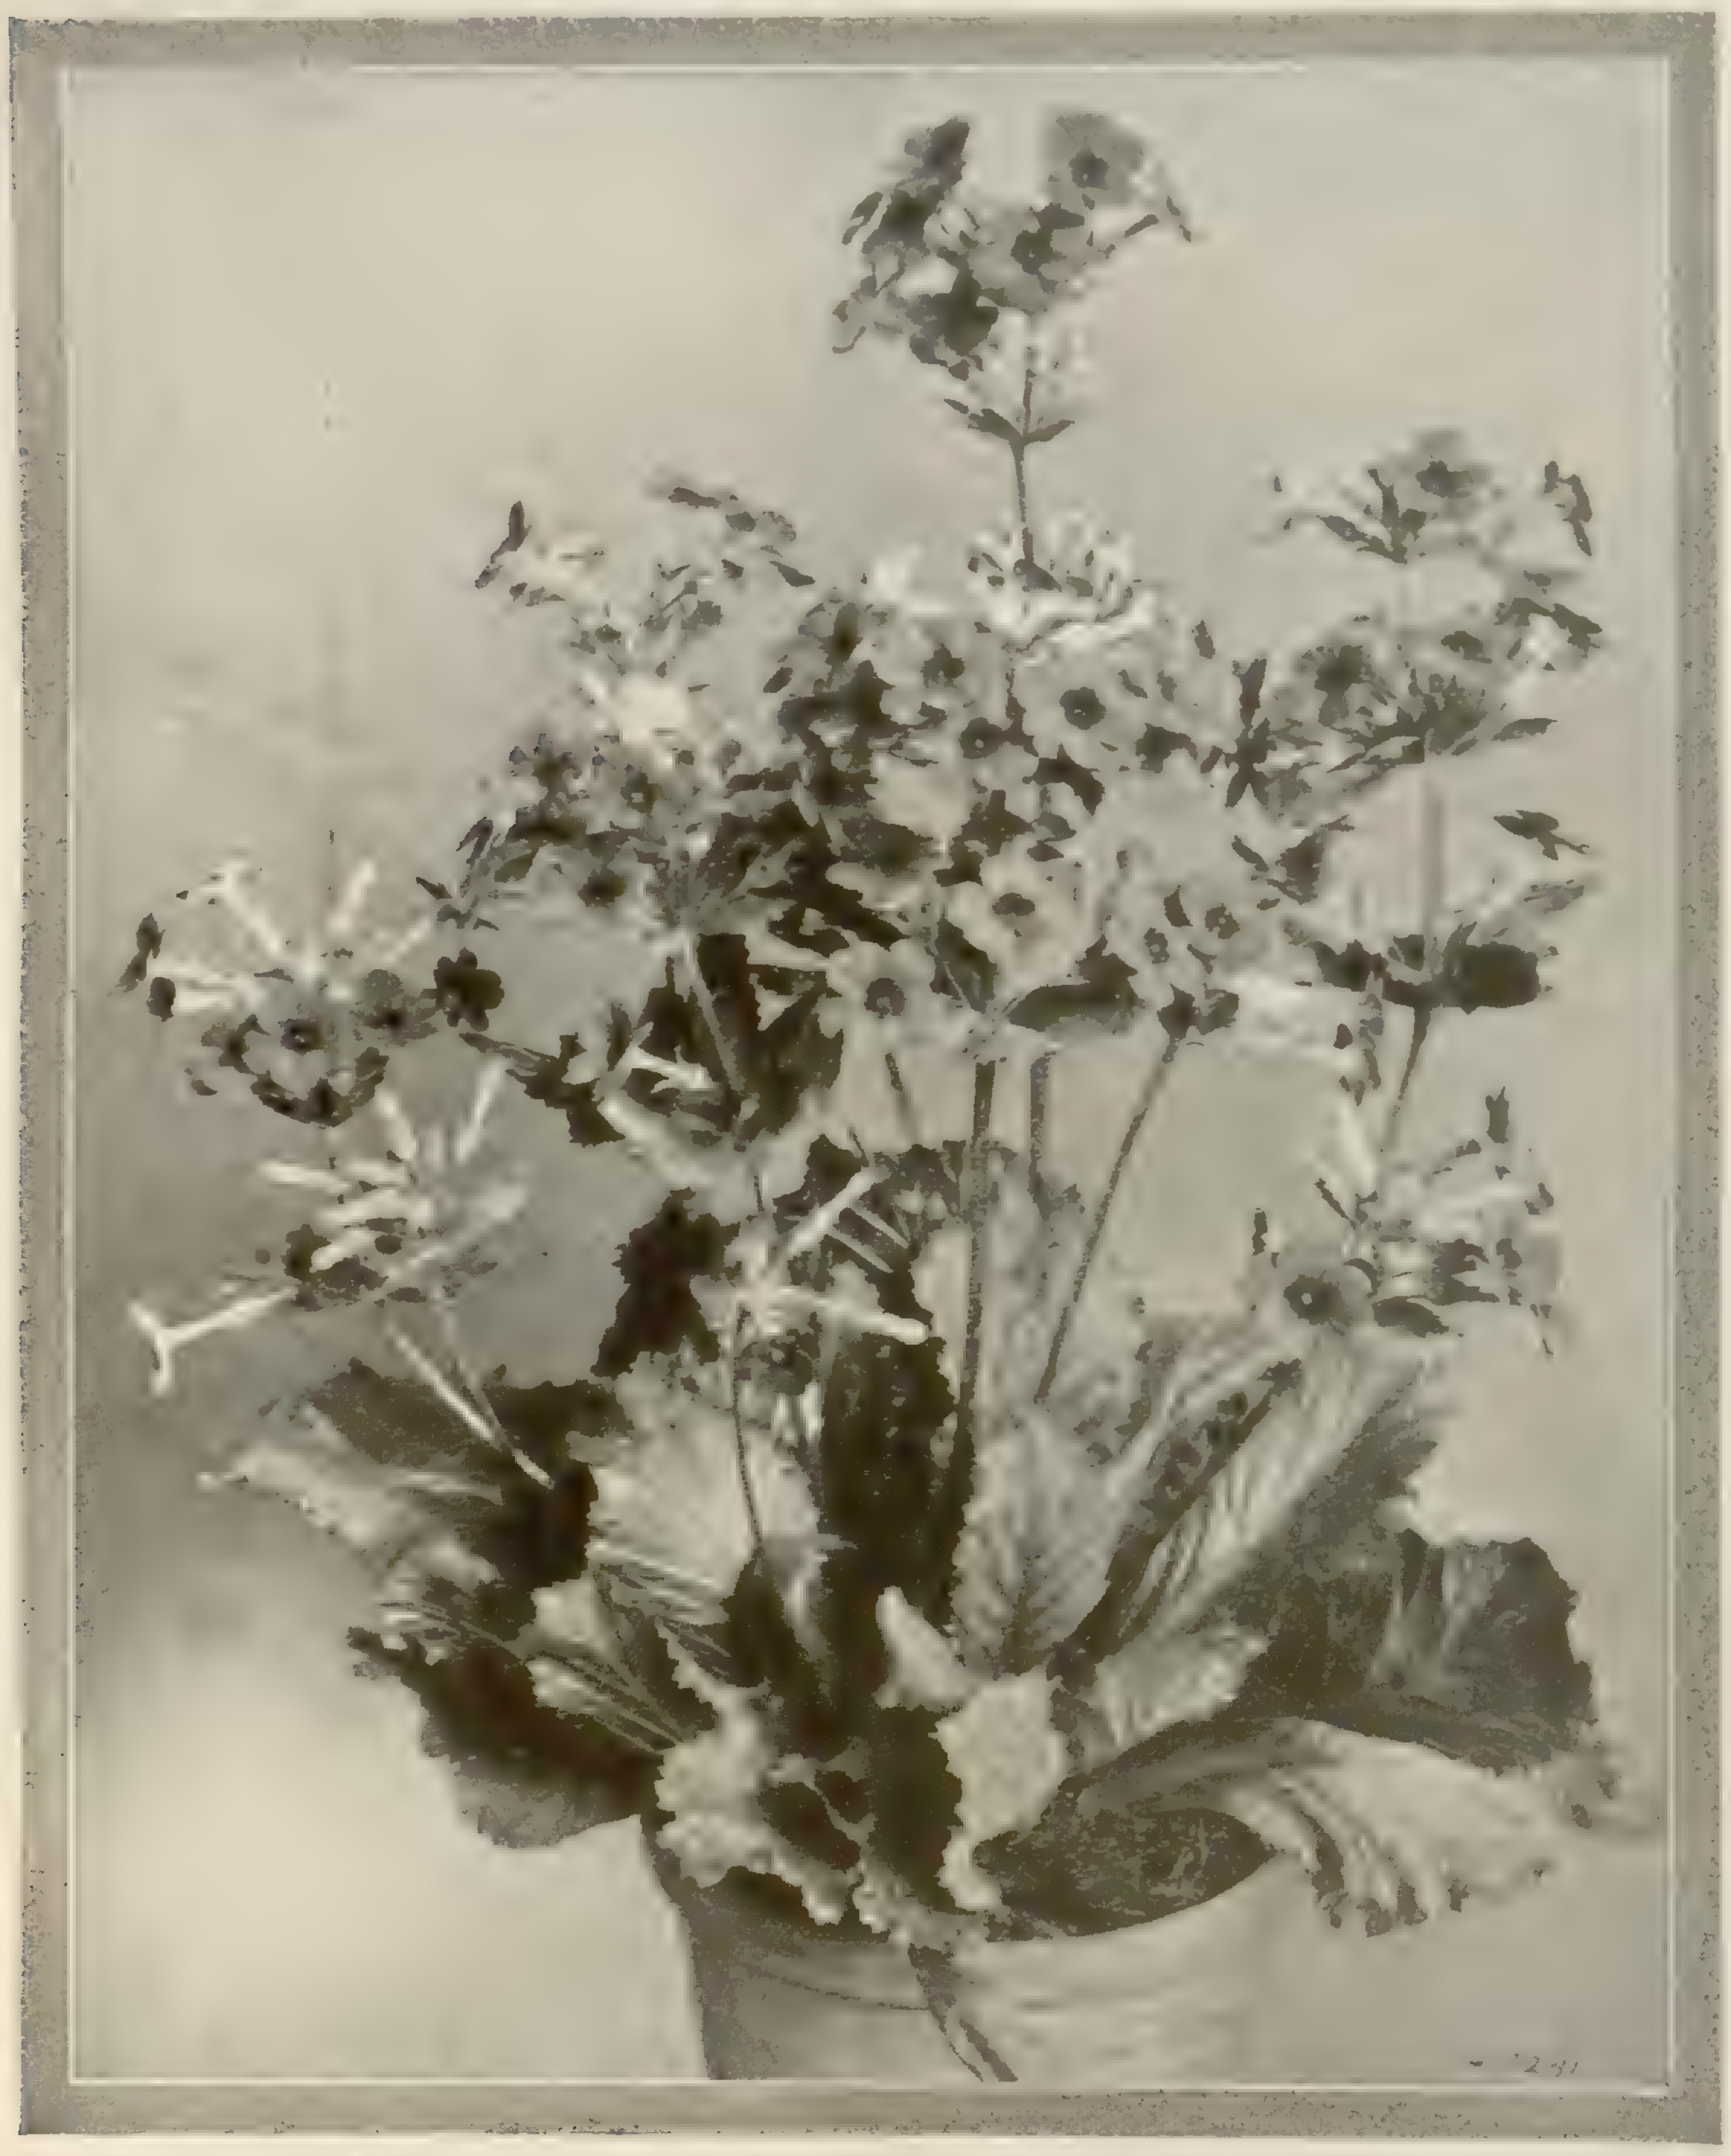
The best kinds in general commerce are: L. aurea, perianth self-coloured yellow; L. Nelsoni, hybrid from aurea, stronger grower, colour bright orange-yellow; L. pendula, purple-red and yellow, strong grower; and L. tricolor, green, red, and yellow; this latter is probably the best known species. Thomas Smith.



CLEMATIS MONTANA GROWN AS A STANDARD IN A SOUTHERN GARDEN.

PRIMULAS.

Not only have the primulas suitable for decorations under glass and indoors increased considerably in varieties, colours, and size, but there are several very interesting species and hybrids of recent introduction that are of much value. The old P. sinensis was at one time indispensable for flowering in winter under glass, but of late years, though many improved forms have been introduced, this has somewhat lost favour owing to the flowers not standing well when cut. The stellata varieties, however, still hold their own, and are very popular.



PRIMULA KEWENSE.
A fine plant, exhibited by Messrs. J. Veitch and Sons. Flowers, rich yellow.

Seeds may be sown at almost any time between January and June, but, as a rule, that sown in March or April will produce plants that will be found most useful for flowering during the dull winter months. Shallow, well-drained pans are preferable for sowing the seeds in, and these should be filled with fine, light sandy soil. The seeds only need a light covering, and if the soil was made thoroughly moist previously to sowing, it will not be necessary to water afterwards, provided the pans are covered with brown paper to prevent evaporation. Should the seeds be allowed to become dry after germination has commenced the majority will in all probability die. There are more failures from this cause than any other, therefore both an even temperature and an equable degree of moisture are essential. There are some superb varieties of P. sinensis, and those who have much conservatory decoration would do well to grow a good batch of them in various colours.

When the seedlings are large enough to handle they should be pricked out into pans or boxes, but they should not be allowed to remain too long in these, as they resent having their roots disturbed much when of some size. They should, therefore, be transferred to small pots as soon as large enough. When these are filled with roots give them a shift into those a couple of sizes larger, growing them on through the summer in pits or frames near the glass. If facing south shading from the bright sun will be necessary, as the plants resent bright sunlight during the summer. Air, however, must be freely admitted on all favourable occasions, otherwise the foliage will not be of that dark healthy hue one so much desires. As the plants come into bloom they may be taken into the greenhouse.

The double white variety, known as P. sinensis fl.-pl., does not seed, and must therefore be increased by cuttings, or, what is better still, by earthing up the old plants with light sandy soil; when this has been done they should be placed in a close pit until fresh roots have formed on the old stems; then divide and pot up, and afterwards treat them in the same way as recommended for the seedlings. There is a form of this named robustum giganteum, which is a much stronger grower than the old type, producing flower stems as thick as a cedar pencil and from nine to twelve inches in length, and bearing flowers about the size of a florin. This is a very useful form, free in flowering, and bearing flowers of good substance that remain in perfection for a considerable time both on the plant and in a cut state. The flowers are pure white, and very useful for a variety of purposes.

Primula obconica.

This species is pretty and interesting, producing flowers of various shades, and blooming continuously through the spring and summer. It may be employed in the greenhouse and the rock garden with equal advantage. The flowers are borne on long slender stalks that carry them well above the foliage. Though not quite hardy, the plants will withstand several degrees of frost, but those grown in a pit or frame where a gentle heat can be provided will bloom through the winter, and when all danger of severe frost is past they may be transferred to the open ground, where they will continue to bloom for some time. Seeds sown in April in a gentle warmth, such as a cold frame or greenhouse, will make nice plants by the autumn if well looked after. We have usually found this species and its varieties grow best when planted out in a cold frame, and if kept from the frost the plants will bloom freely during the summer. If allowed to seed where they grow the young plants will come up in abundance all round the old ones, and if these are pricked off when large enough a good stock may be readily worked up with but little trouble. These seedlings could, in due time, be potted up for flowering in the greenhouse.

Primula verticillata.

This is a peculiar species producing sweet-scented flowers that are borne on long slender stalks. The foliage, which is tomentose, somewhat resembles that of P. cashmeriana, but is longer and not quite so wide. A batch of this planted out in a shaded border in spring, continued to bloom most profusely through the summer. It is not quite hardy, but it is most valuable for the greenhouse or a shaded place in the garden. This is said to be a native of Abyssinia. The flowers are tubular, and of a clear canary colour, not by any means showy, but their fragrance reminds one of the common primrose.

Primula Kewensis.

This superb hybrid originated from the last-named, but differs from it considerably, the flowers being larger and of a brighter colour. This is a charming plant for the greenhouse, as its free flowering habit makes it most useful and effective. The long tubular flowers, borne on stout stems, are carried well above the foliage. Treated in the same way as P. verticillata the plants will grow strongly and bloom most profusely, giving a wealth of flowers that is sure to please the most fastidious.

H. C. Prinsep.

Buxted Park Gardens.

The National Auricula Society (Northern Section) will hold its thirty-fifth annual show in the Corn Exchange, Market Place, Manchester, from 1 to 6 p.m. on Saturday, May 2. Besides the show and alpine auriculas the gold-laced polyanthuses are expected to be very fine.

THE BARBERTON DAISY.

Although many years have elapsed since Gerbera Jamesoni, the Barberton daisy, was introduced to English gardens, and some thousands of plants have been distributed in the meantime, there is still as little evidence of their becoming permanent inhabitants of English gardens as at the first. At Edinburgh, at Cambridge, and a few other noted gardens, there are thriving colonies which seem quite capable of living indefinitely, and there is, in recent seedling races a greater vigour and floral yield than in imported plants once commonly distributed. The gerbera that will stand the rigours of an English climate unaided has yet to be reared, and the few plants that survive in the gardens noted are kept alive by the advantages of skilfully chosen sites on the one hand, and by care in the maintenance of a moisture limit by the use of hand-lights on the other.

One therefore still feels impelled to regard Gerbera Jamesoni as a greenhouse plant that will, under peculiarly fortuitous conditions, occasionally thrive in the open air, there is no possibility, however, of ever "using" them in gardens for grouping in the warmest borders with a view to permanent effect, and in the warmest parts of the West there is just as little hope. Studied purely as a greenhouse plant, and liberally treated the while, there is much in gerberas to admire. Plants grow readily in rather roomy receptacles, preferably six to eight in a deep pan partly filled with limestone chippings and turfy loam in equal parts, raising the plants slightly above the rim of the pot or pan, and finally surface over with finer loam and silver sand.

One gathers from expert observers a good deal of information as to the manner gerberas grow in the Barberton district. There, a distinct resting season is enforced by climatic conditions; this, however, is not the case under cultivation, the plants growing little or much throughout the whole of the seasons. Their permanent roots are deserving of study. They penetrate to incredible depths, and are apparently always slightly active. Old plants under cultivation have very thick fleshy store roots that are readily injured by excess of wet. A roomy pan filled with turf and limestone or grit-stone chips, provides ideal conditions for such roots, and with due care as to watering, erring on the side of giving too little rather than too much, there should be no trouble in managing gerberas well. Their magnificent orange-scarlet flowers are superlatively attractive always, and with the aid of a little rational treatment should be always forthcoming in quantity. A buoyant atmosphere and a temperature ranging from 35 degrees minimum to 80 degrees maximum, as the two possible extremes, will keep the plants thrifty.

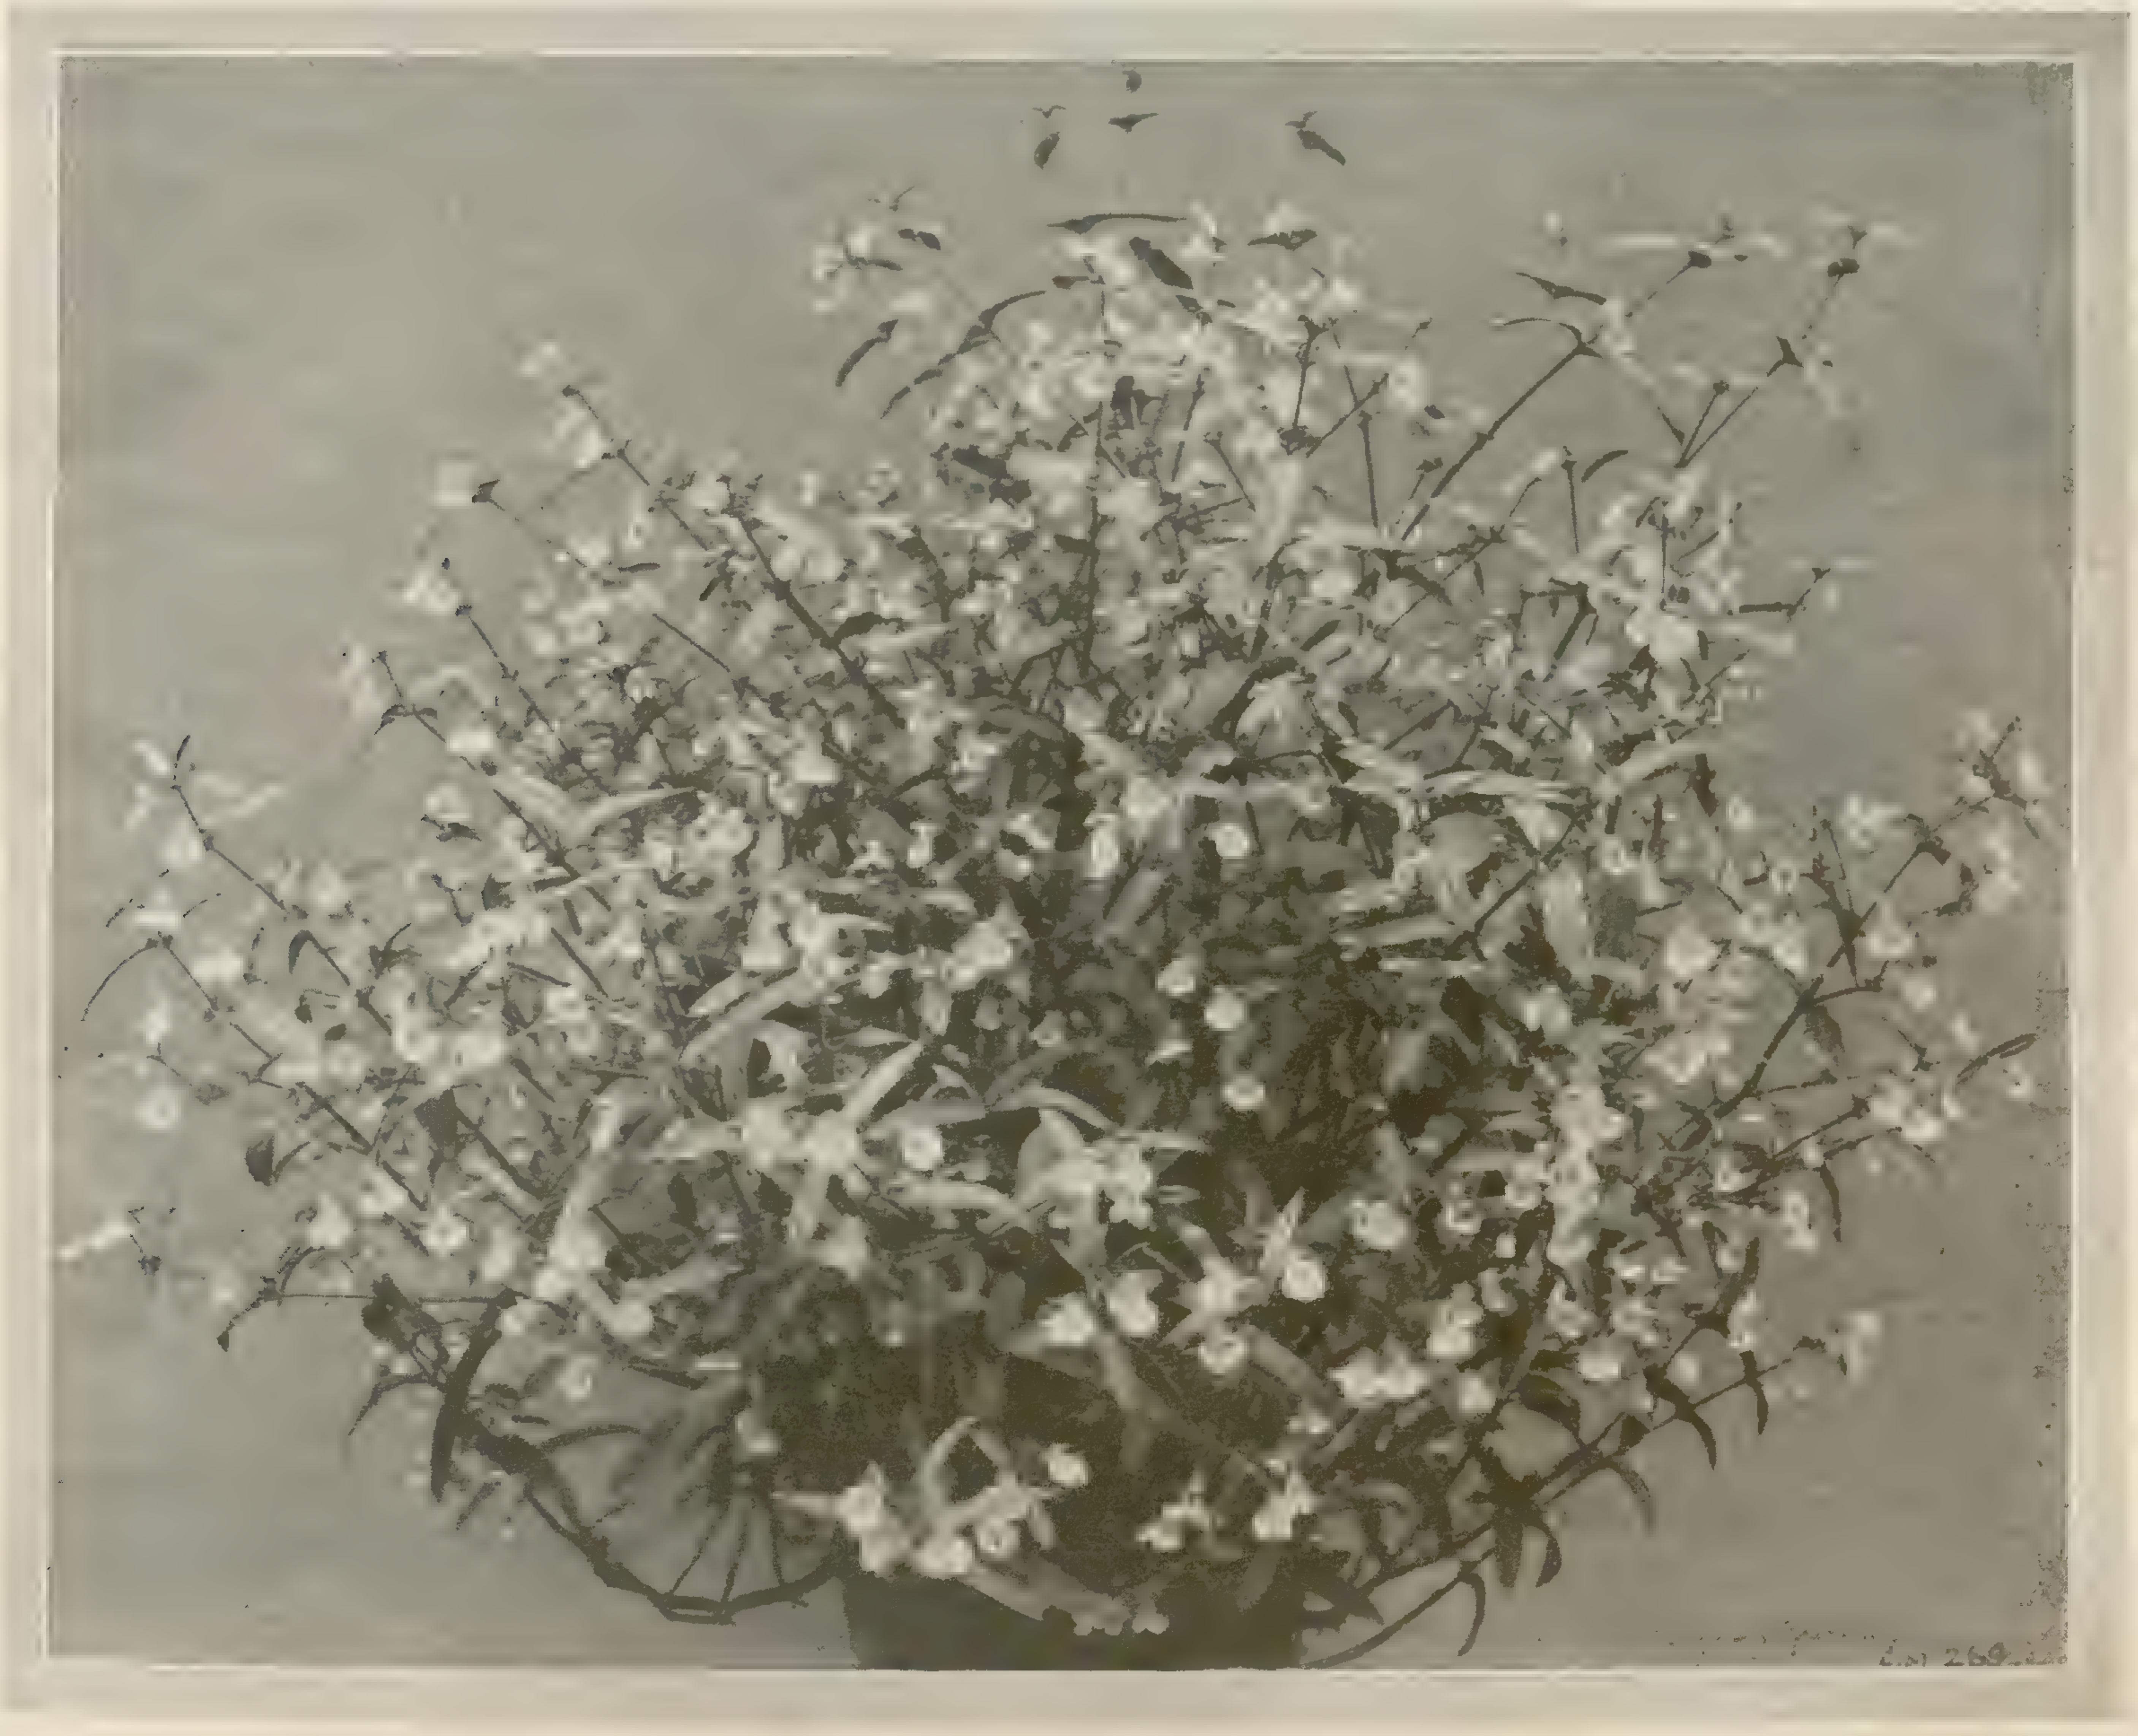
G. B. Mallett.

The Value of Flower Imports was considerably less in March last than in the corresponding month of the two previous years, but for the first quarter of the year it was about £8,000 more than in 1907, and about £21,000 less than in 1906. The total value for the quarters was £94,906. For last month the value was £35,185, against £42,611 in March, 1907, and £50,232 in March, 1906.

IMPATIENS OPPOSITIFOLIA.

Seeds of this pretty annual balsam were received at Kew early in 1906 from Mr. W. A. Talbot, of Mahabeleshwar, India, under the name of Impatiens Dalzelli. These germinated freely, and the plants were grown in a warm greenhouse, under which treatment they flowered profusely during the months of September and October. Specimens were then sent to Sir Joseph Hooker, the acknowledged authority on the genus, who determined it to be I. oppositifolia, a plant known to botanists for many years, but not previously in cultivation in this country.

The species is of very easy culture, and readily forms a large spreading bush, followed by quantities of flowers in late autumn, which are in turn succeeded by abundance of seeds. The plant illustrated was eight months old from seed sowing, and at the time the photograph was taken was carrying many hundreds of flowers. The flowers are an inch in diameter, and vary in colour considerably in the different seedlings, from pink to rosy-red or rosy-purple, and are borne in clusters in the axils of all the upper leaves. The leaves are opposite and decussate, three to five inches long, lanceolate or elliptic-lanceolate, and of a rich dark green colour.



IMPATIENS OPPOSITIFOLIA.
Flowers varying in colour from pink to rose-red.

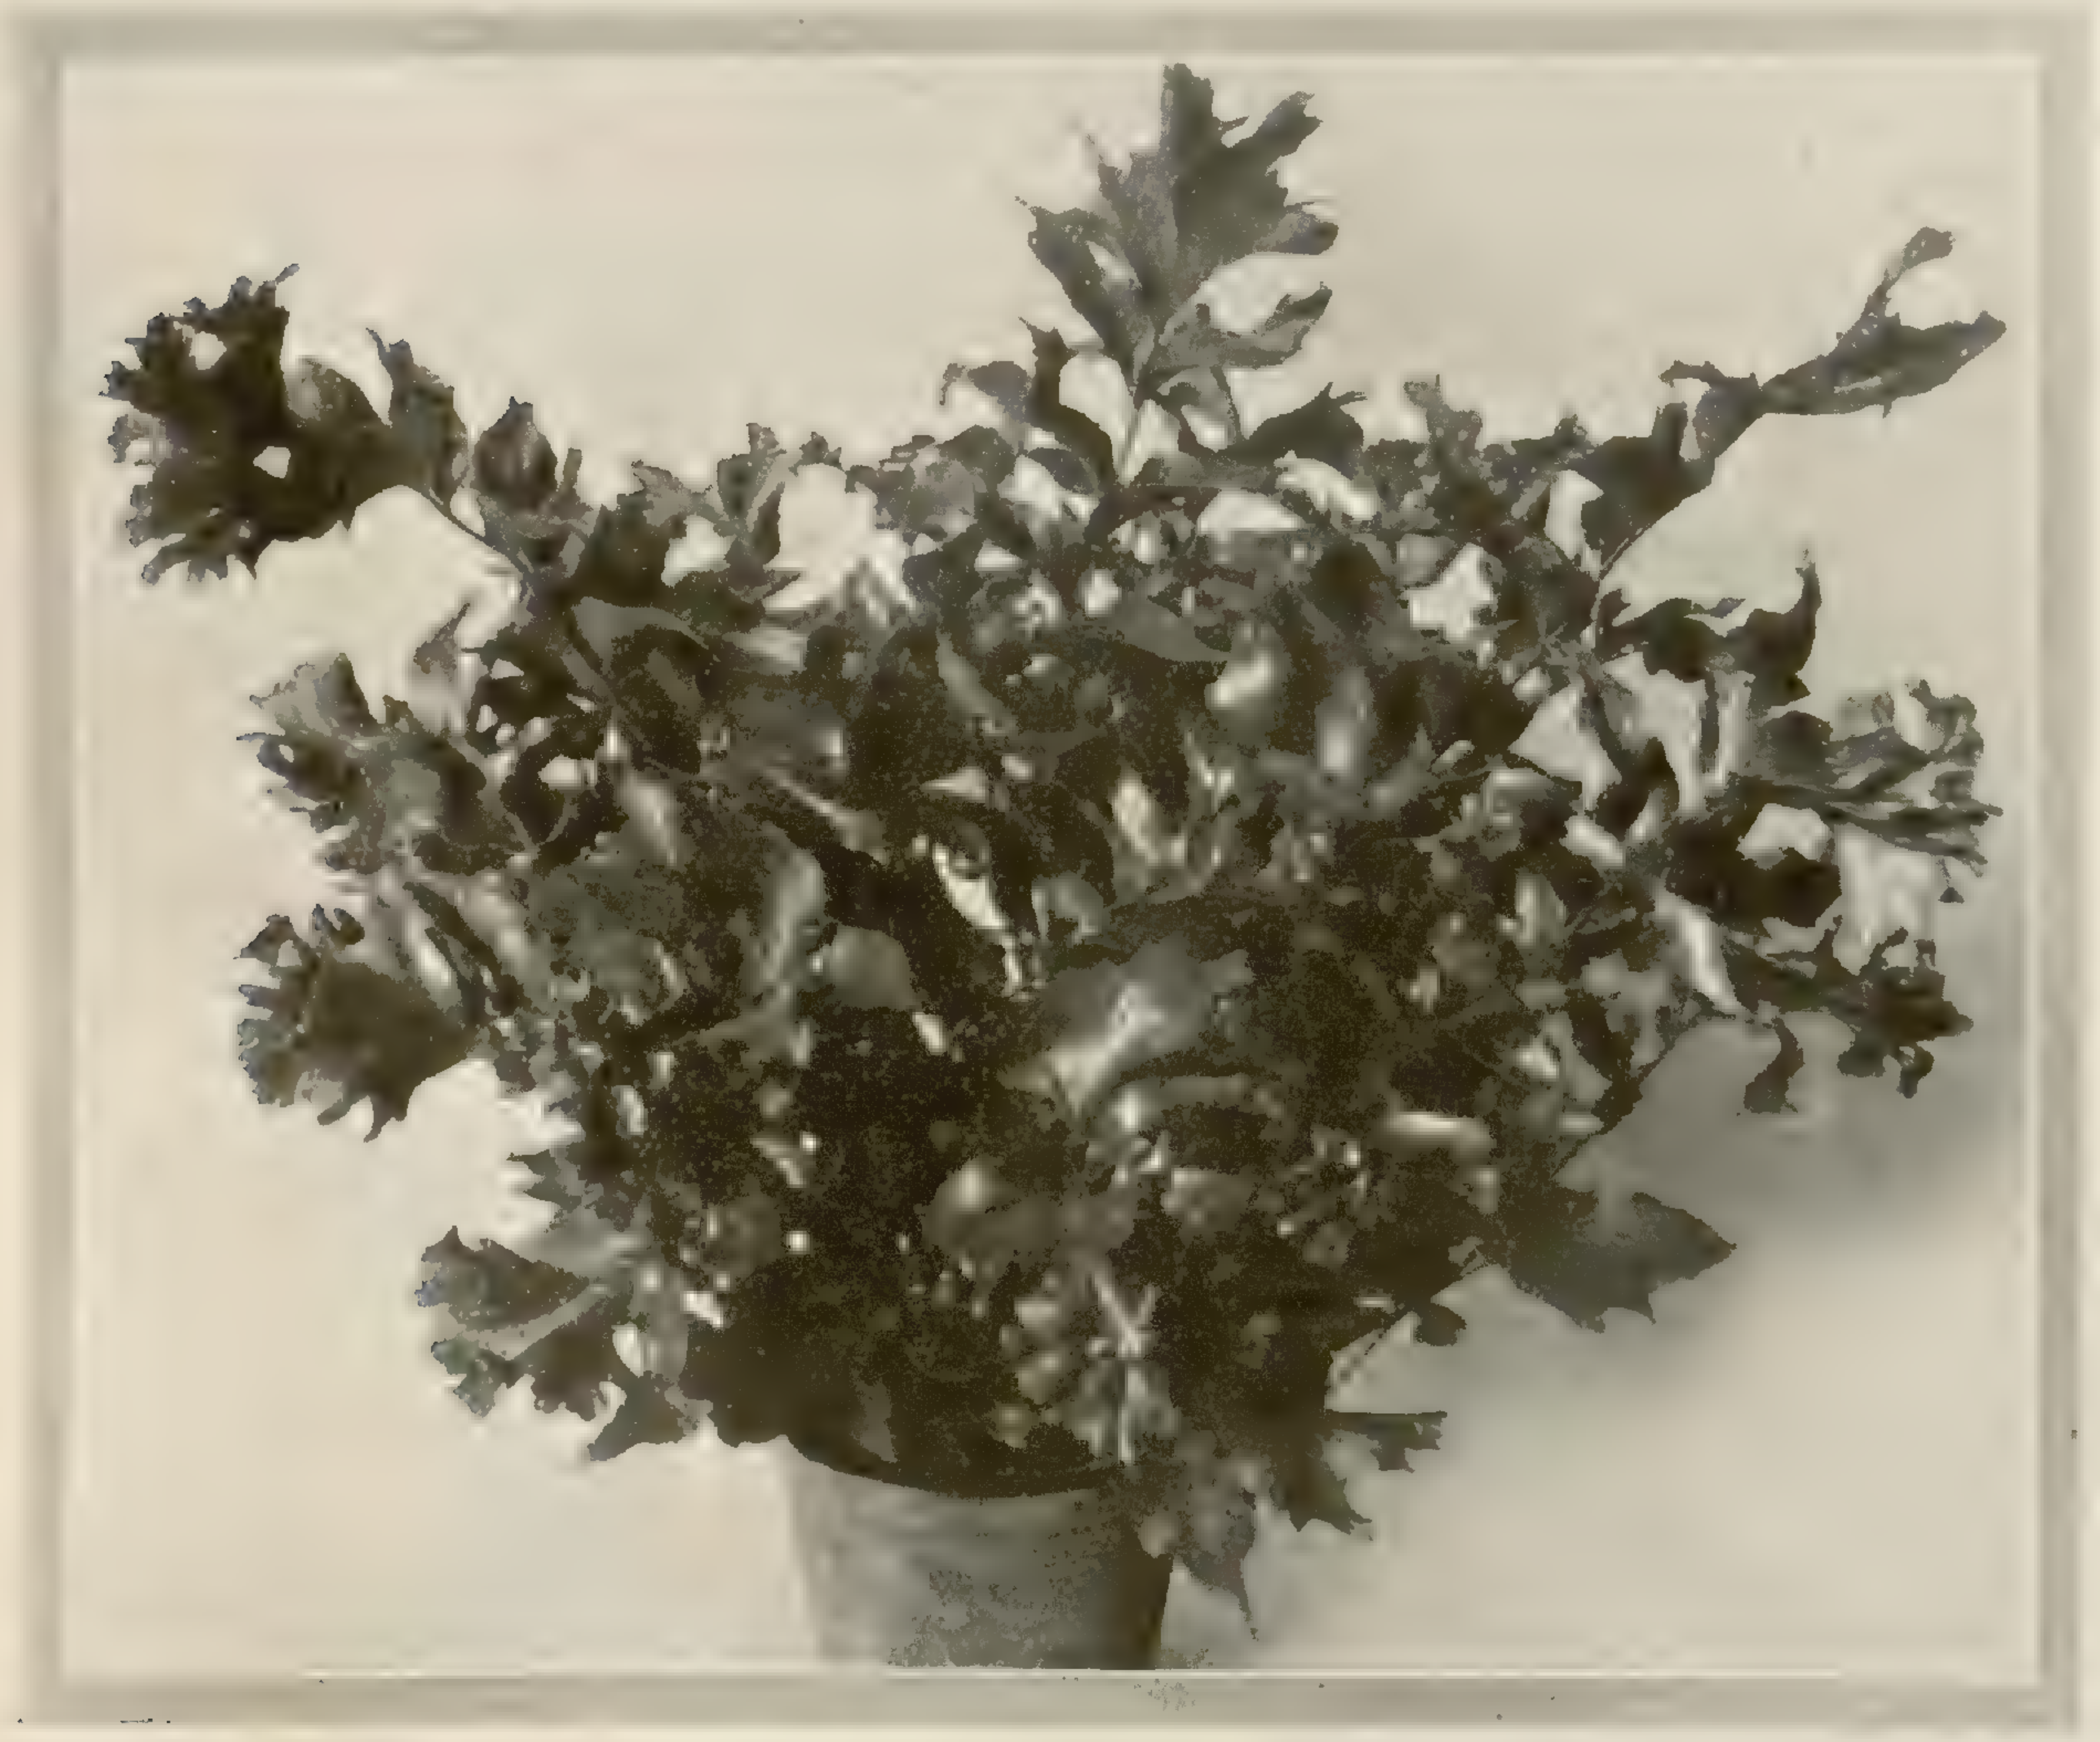
Impatiens oppositifolia is a common plant throughout the island of Ceylon, from the sea level to 7,000 feet altitude, and also on the mountains of Malabar, Canara, and the Concan, at altitudes of 3,000 to 5,000 feet.

Kew. C. P. Raffill.

NEW PLANTS, ETC.

VIBURNUM CARLESI.

This is a beautiful new hardy shrub that promises to become very useful and popular. It is a species from the Corea, and it has rounded flower heads of white or pale pink flowers that remind one in some degree of Luculia gratissima, and also of a rondeletia. These flower heads are about four or six inches across, compact, and borne at the ends of stiff, sturdy branches. In addition to their beauty the flowers possess a remarkably sweet fragrance. The plant exhibited had been grown under glass, and consequently the flowers were white, but the flowers expanded out of doors are blush-pink. A.M., R.H.S., April 14. Mr. Bain, gardener to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking.



CYRTOMIUM FALCATUM MAYI.
A finely-crested form of one of the most useful of the ferns for the conservatory, and for indoor apartments, exhibited by Mr. H. B. May.

CYRTOMIUM FALCATUM MAYI.

A handsome and useful variety of an old favourite fern. The type is well known for its value in the cool greenhouse and in the home, but this new variety will be far and away more elegant than the type and just as useful. The fronds of C. f. Mayi are rather more stiff than those of the type, and less arching, but they spread gently and are prettily crested. A.M., R.H.S., April 14. Messrs. H. B. May and Sons, Edmonton.

CYMBIDIUM EBURNEUM GOODSONIANUM.

This differs from the type in having a broad, bright rosy-purple band down the centre of the labellum, but in all other particulars it is identical. A very interesting variation. A.M., R.H.S., April 14. Mr. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney.

CYPRIPEDIUM BERKLEYANUM.

This is a hybrid between Cypripedium Boxalli and C. bellatulum, and it has a white dorsal sepal freely marked with purple dots, except at the margins. The petals are dark dull purple-red, as also is the lip. The flowers are of medium size and the foliage is mottled with two shades of green. A.M., R.H.S., March 31. Mr. J. Forster Alcock, Northchurch, Berkhamsted.

CATTLEYA SCHRODERÆ THE BARON.

A very beautiful orchid, and, no doubt, the most beautiful variety of C. Schroderæ known. It has large white sepals and petals, and a very handsome, shapely lip, coloured deep yellow, pale rose, and bright purple. F.C.C., R.H.S., April 14. Mr. H. Alexander, orchid grower to Major Holford, Westonbirt, Gloucester.

CYPRIPEDIUM BELLATULUM EXHIM'S VAR.

A very distinct and handsome variety, in which the greater part of the flower is densely sprinkled with dark red-purple spots. F.C.C., R.H.S., April 14. Mr. J. Forster Alcock, Northchurch, Berkhamsted.

DENDROBIUM BRYMERIANUM GATTON PARK VAR.

This is a glorified form of the beautiful old D. Brymerianum; it has big flowers, bright golden-yellow, with a wonderfully fringed lip. A.M., R.H.S., April 14. Mr. W. P. Bound, gardener to Sir J. Colman, Bart., Gatton Park, Reigate.

NARCISSUS BUTTERCUP.

This very beautiful daffodil is wholly of a delightful golden buttercup-yellow colour. It is regarded as a member of the incomparabilis section, but it has a trumpet rather longer than is usually associated with that group. The trumpet is clean cut at the mouth and is set in the midst of a regular and finely-proportioned perianth. The flower is sweetly scented, giving evidence of one of its parents—i.e., the Campernelle Jonquil. A.M., R.H.S., April 14. Mr. Chas. Dawson, Gulval, Penzance.

TREES AND FRUIT.

Fruit Prospects.

Considering the cold, wet, sunless weather of last summer, it is rather surprising to see fruit trees giving such a promise of an abundant yield this year. The bright, dry September we had has no doubt contributed largely towards this desirable result, and it is to be hoped, with the late season in its favour, that neither frosts nor cold winds will come to mar the present prospects. I find this promise of a fruit year evident in various parts of the country, on different kinds of soils, and on trees of all ages and vitality, and also under various methods of culture, but more especially those which have been well cared for in the provision of food, and allowed freedom of growth in root and branch.

The other day I came across a fine lot of young trees of Cox's Orange Pippin apple, on the paradise stock, which had been planted a little over 12 months, with almost every bud a fruit-producing one. These plants were about four feet high, pyramidal trained, and no pruning had been practised upon them since they were received from the nursery. The soil in which they are growing has been well cultivated for years, and is rich in the plant foods required by a fruit-producing crop, so that the trees had everything in their favour. In their immediate neighbourhood there were pruned and naturally-grown trees of both apples and pears, and, although all were alike in showing plenty of fruit buds, yet it was those which had been left to shape and develop themselves in their own way, and had not been subjected to the knife, that exhibited the greatest profusion of flower buds. For ornamental purposes, such trees would be most effective.

With a favourable flowering period it will be necessary to severely thin the fruit to prevent the energy of the trees being over-taxed. Much can evidently be done by a selection of stocks to foster the production of fruit, as testified by some Jargonelle pears on the quince stock in the same orchard. These were single cordons, about 7ft. long, and wreathed in expanding blossoms from top to bottom. This variety generally does best when it is left free and has some protection from inclement weather; but, in the case of these cordons there is ample proof that it can be made amenable to the restriction of its growth, and yet its fruitfulness not be impaired. This stock is undoubtedly the right one for the Jargonelle for wall and espalier-trained trees, and is is questionable if the quince is not the right stock for all trained pears.

The only fruit trees I have seen over a wide area this spring that may be said to be sparsely covered wth flower buds have been growing in kitchen gardens worked on crab and pear stocks, and are annually operated upon with the knife. In some positions, and for certain purposes, pruning is an absolute necessity, but where the branch growth has to be restricted there is ample proof at the present time that the dwarfing stock is the right one for all such trees.

Pedestrian.

ANNUALS FOR GARDEN ADORNMENT.

"Nature is ever old, ever mature, ever young," wrote an essayist, "for her work is to be seen in apparent decay, in perfection, and in bud every day." It is true, indeed, that when flowers are absent from a tree or shrub it but means that either fruit, seed, leaf, sap, root, or branch are in fullest excellence, but probably the writer meant rather that the season when one floral beauty is no more is also the time for the utter magnificence of some other. When we make a lavish use of summer and autumn blooming annuals we show our appreciation of Nature's methods. No matter their fleeting character, let us value the charm while it lasts, confident that there will come the harvest of other splendours.

Again, human sympathies are quickly claimed by new beauties, and, though the annuals we employ may not be all novelties, some, no doubt having gratified flower-lovers for centuries past, the individual representatives are new, and the effects are new that we have created with them. All, then, that is necessary for us is to see that those effects are worthy both of the blossoms and of our love for the gentle craft of gardening.

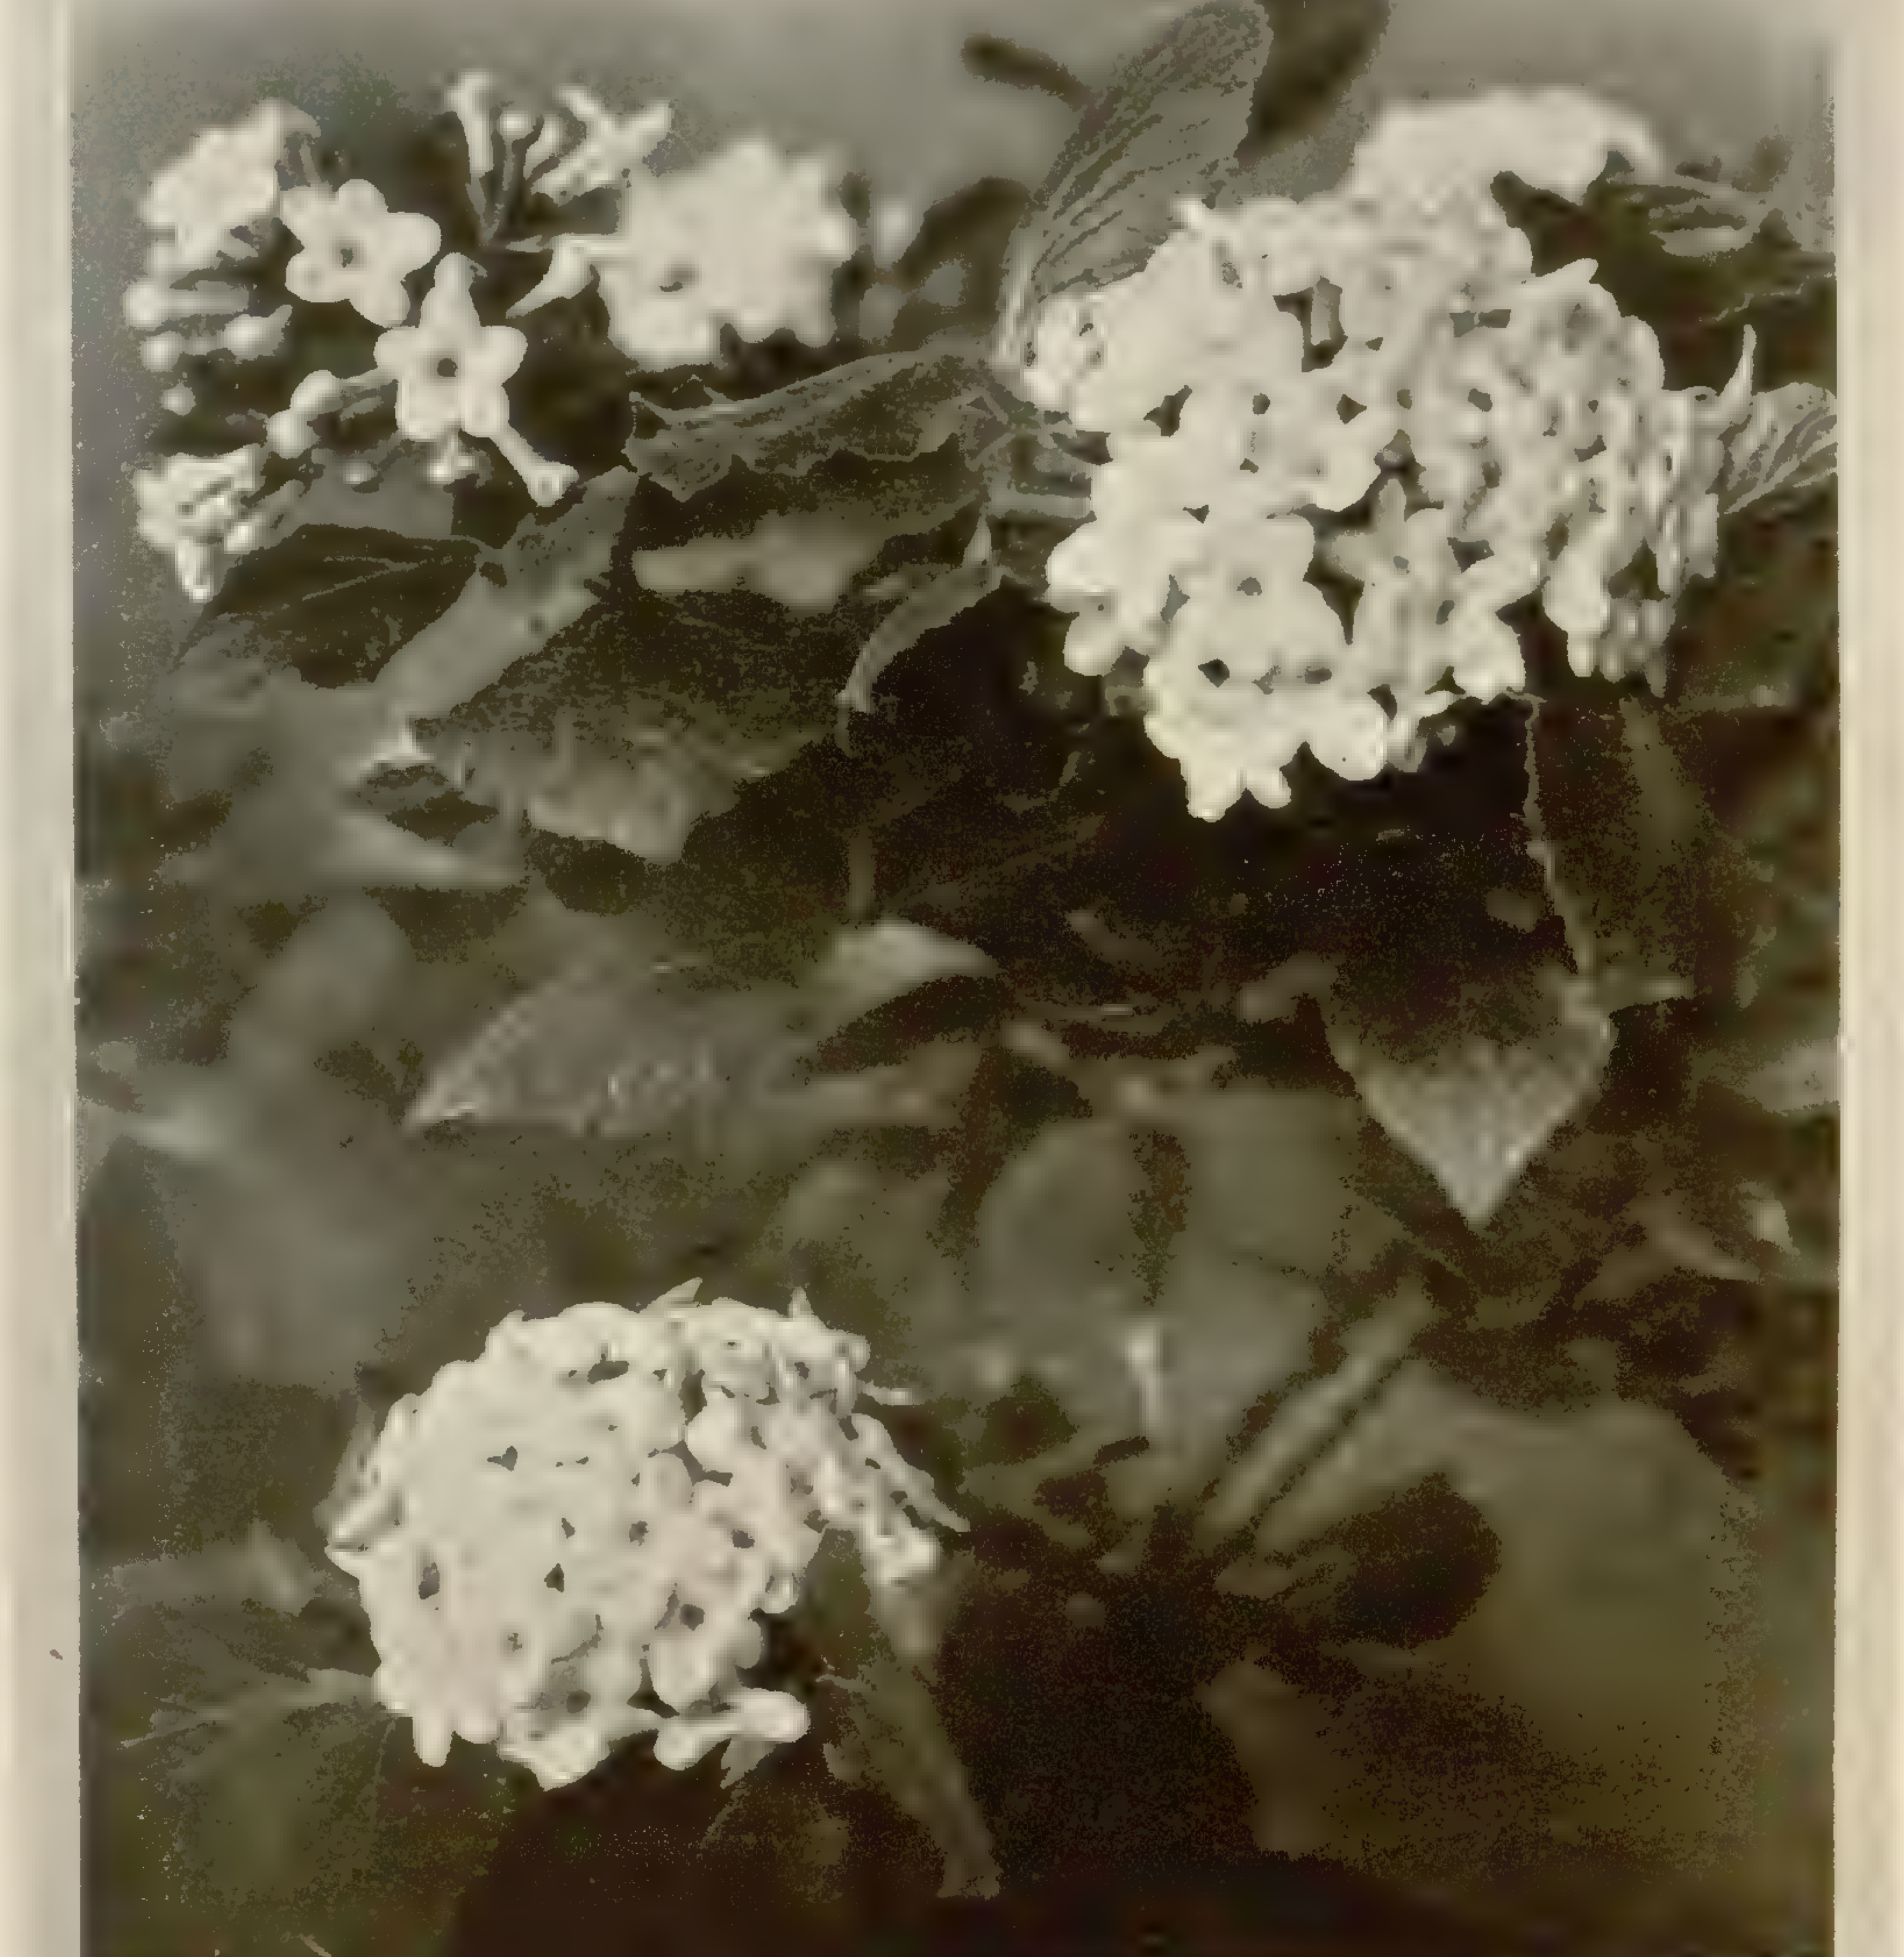
Annuals are fit for adorning all parts of the pleasure-grounds; they are not weedy, straggling, untidy, unless ill-grown. Take, for example, the giant double poppy; we may have it in white as pure as freshly-fallen snow, in cerise-scarlet flecked with white, in a quaint dull brick-rose, in rose and cream-yellow (Harlequin), in white and orange-vermilion (American Flag), or in an exquisite peach mauve. One of the easiest of all flowers to grow, a scattering of seed after a shower and a subsequent thinning out will produce it in perfection; on ordinary soil it flourishes, in poor land it does not refuse to thrive; yet a mass of any variety in the foreground of a shrubbery transforms that spot into a place to be often visited and lovingly remembered, while a similarly shrubbed border, with groups of the different poppies at intervals will prove one of the garden's fairest features.

Then is not the annual sunflower a much-abused flower? The monstrous varieties are cultivated in order that speculative growers may apply the tape measure to the blooms and the foot-rule to the stems; the six and seven-feet kinds, so vastly superior in grace and loveliness are now neglected, so seedsmen say. Many an old English manor house, farm-homestead, or cottage needs but a plentiful enough surrounding of sunflowers and hollyhocks to become fit subjects for the artist's pencil. Helianthus citrinus, the five-feet pale yellow, Helianthus Golden Nigger, four feet, deep gold, with velvety purple-black centre, are two excellent varieties to grow as companions to the ordinary taller Helianthus annuus, but the "Russian Giant" possesses few merits for garden beautification.

There are grounds in which long hedges of fragrant sweet peas are annually looked-for delights, yet other gardens in which the homely flower on its faggot supports seems out of place; the white stone mansion should keep to the stately flowers, the gabled manor or modern villa can afford to show a more catholic taste. Cosmea bipinnata is an example of the annual of absolutely refined or choice appearance; beds of this on a wide lawn are invariably pleasing, borders filled by it have all the merits and none of the heavy over-foliaged appearance of dahlia masses.

Hardy annuals are rarely grown to perfection; that is one reason why gardeners turn to the class of half-hardy subjects, known as bedding plants, when planting the most important spaces. The beds of Lord Windsor's garden, Hogan Castle, Cardiff, used to be remarkable—[and still are —Ed.]—for the careful displays of the simplest sorts of annuals, eschscholtzias, linarias, godetias, etc., and each year proved the true worth of these blooms. Perhaps no bloom, except that of one species of broom, can equal the colour combination of Eschscholtzia Mandarin when grown in soil rich in humus; the orange of Erysimum Perofskianum has a tone not achieved by costly begonias; Nigella Miss Jekyll, is of greatest value for the azure tint that one could wish, nevertheless, were unveiled by the quaint greenery; coreopsis or calliopsis, Crimson King, offers a glowing terra-cotta crimson of unique splendour, and will carpet a stretch of ground so as to show from afar, though but a nine-inch plant.

One of the finest ornaments we can set up each summer in an open place in the garden is a collection of annual sunflowers surrounded by tall purple-violet jacobæa, single and double; the sun on this bed will make it a blaze of satisfying colour. A second grand show will result from tall blue larkspurs widely bordered by the royal blue Phacelia campanularia. The scarlet of the tulip poppy will produce a bed gayer than can be achieved with pelargoniums or verbenas; its petals glisten like satin, its cup-shaped, thick-petalled flowers seem literally to retain the sunshine. M. H.



VIBURNUM CARLESI.

A beautiful hardy shrub, exhibited by Mr. Bain, the flowers white, tinted pink when produced in the open, and white when developed under glass.

THE QUALITY OF POTATOES

The food value of potatoes is almost entirely dependent upon their starch content. From extensive chemical analyses which have been made of the tubers grown under different soil, manurial, and variety conditions, it has been found that the starch content may be as low as 8 per cent., and as high as 29 per cent.

These investigations have stimulated cultural efforts to improve the potato plants to the end that more abundant crops may be produced, and that these crops shall give a more acceptable product for human food. Among other conditions, in regard to quality, it is found that potatoes that are grown in a depth of soil ranging from two to four inches are generally richer in starch than those grown either shallower or deeper. Those grown deeper than four inches are oftentimes watery, and seem to be immature both in regard to starch development and cellular structure.

When the content of starch falls much below 17 per cent. the indications are that the tubers have not developed properly, that is they have not ripened, or they have grown under adverse climatic or soil conditions, and such potatoes, if cooked for human food, will not meet the standard set for table potatoes in this country.

At the same time we have to remember that the culinary value of potatoes varies with the tastes and estimation of different persons. For example, a potato of a starchy flavour, white and floury, and mealy when cooked, is by some persons considered more desirable than a potato which is strong flavoured or soggy after boiling This mealy condition is usually found in potatoes with a starch content ranging from 18 to 24 per cent. On the other hand, there are persons who prefer tubers which retain their form when cooked, are yellow in colour, and are soggy after boiling. This condition is usually found in potatoes low in starch content and high in protein. These low qualities may be due to unripeness or to unfavourable conditions for growth and development.

Then there are market estimates of quality in potatoes, which have no direct relation to the culinary or structural considerations. These may be classed as size, surface or skin aspects, and shapeliness, and sometimes variety considerations. Excepting the potatoes put on the market as earlies, those having a more or less netted skin, or those whose skin has a corky appearance, are usually preferred to the smooth and clear-skinned varieties. This appearance or touch is, in some instances, a variety characteristic, but in general it indicates a degree of maturity or development which promises good cooking quality. On the other hand, the potatoes of smooth and clear skin are oftentimes excessively watery or immature.

Quality of potatoes, from both the trade and culinary points of view, varies to a limited extent in different varieties; but, as a general rule, a knowledge of variety characteristics is possessed only by those who have given the question some study. However, it is a matter of common observation that some varieties resist disease in storage better than others, and some deteriorate in cooking quality after going into storage. Undesirable flavours or colours are developed, and sometimes the tendency to break down into a mealy condition upon boiling diminishes. In spite of all these distinguishing features, it is very difficult to separate individual tubers or varieties of poor quality from those of good quality upon a superficial examination. It is very seldom that a person can go into the storage room and select the varieties of desirable quality from the undesirable with any great degree of certainty.

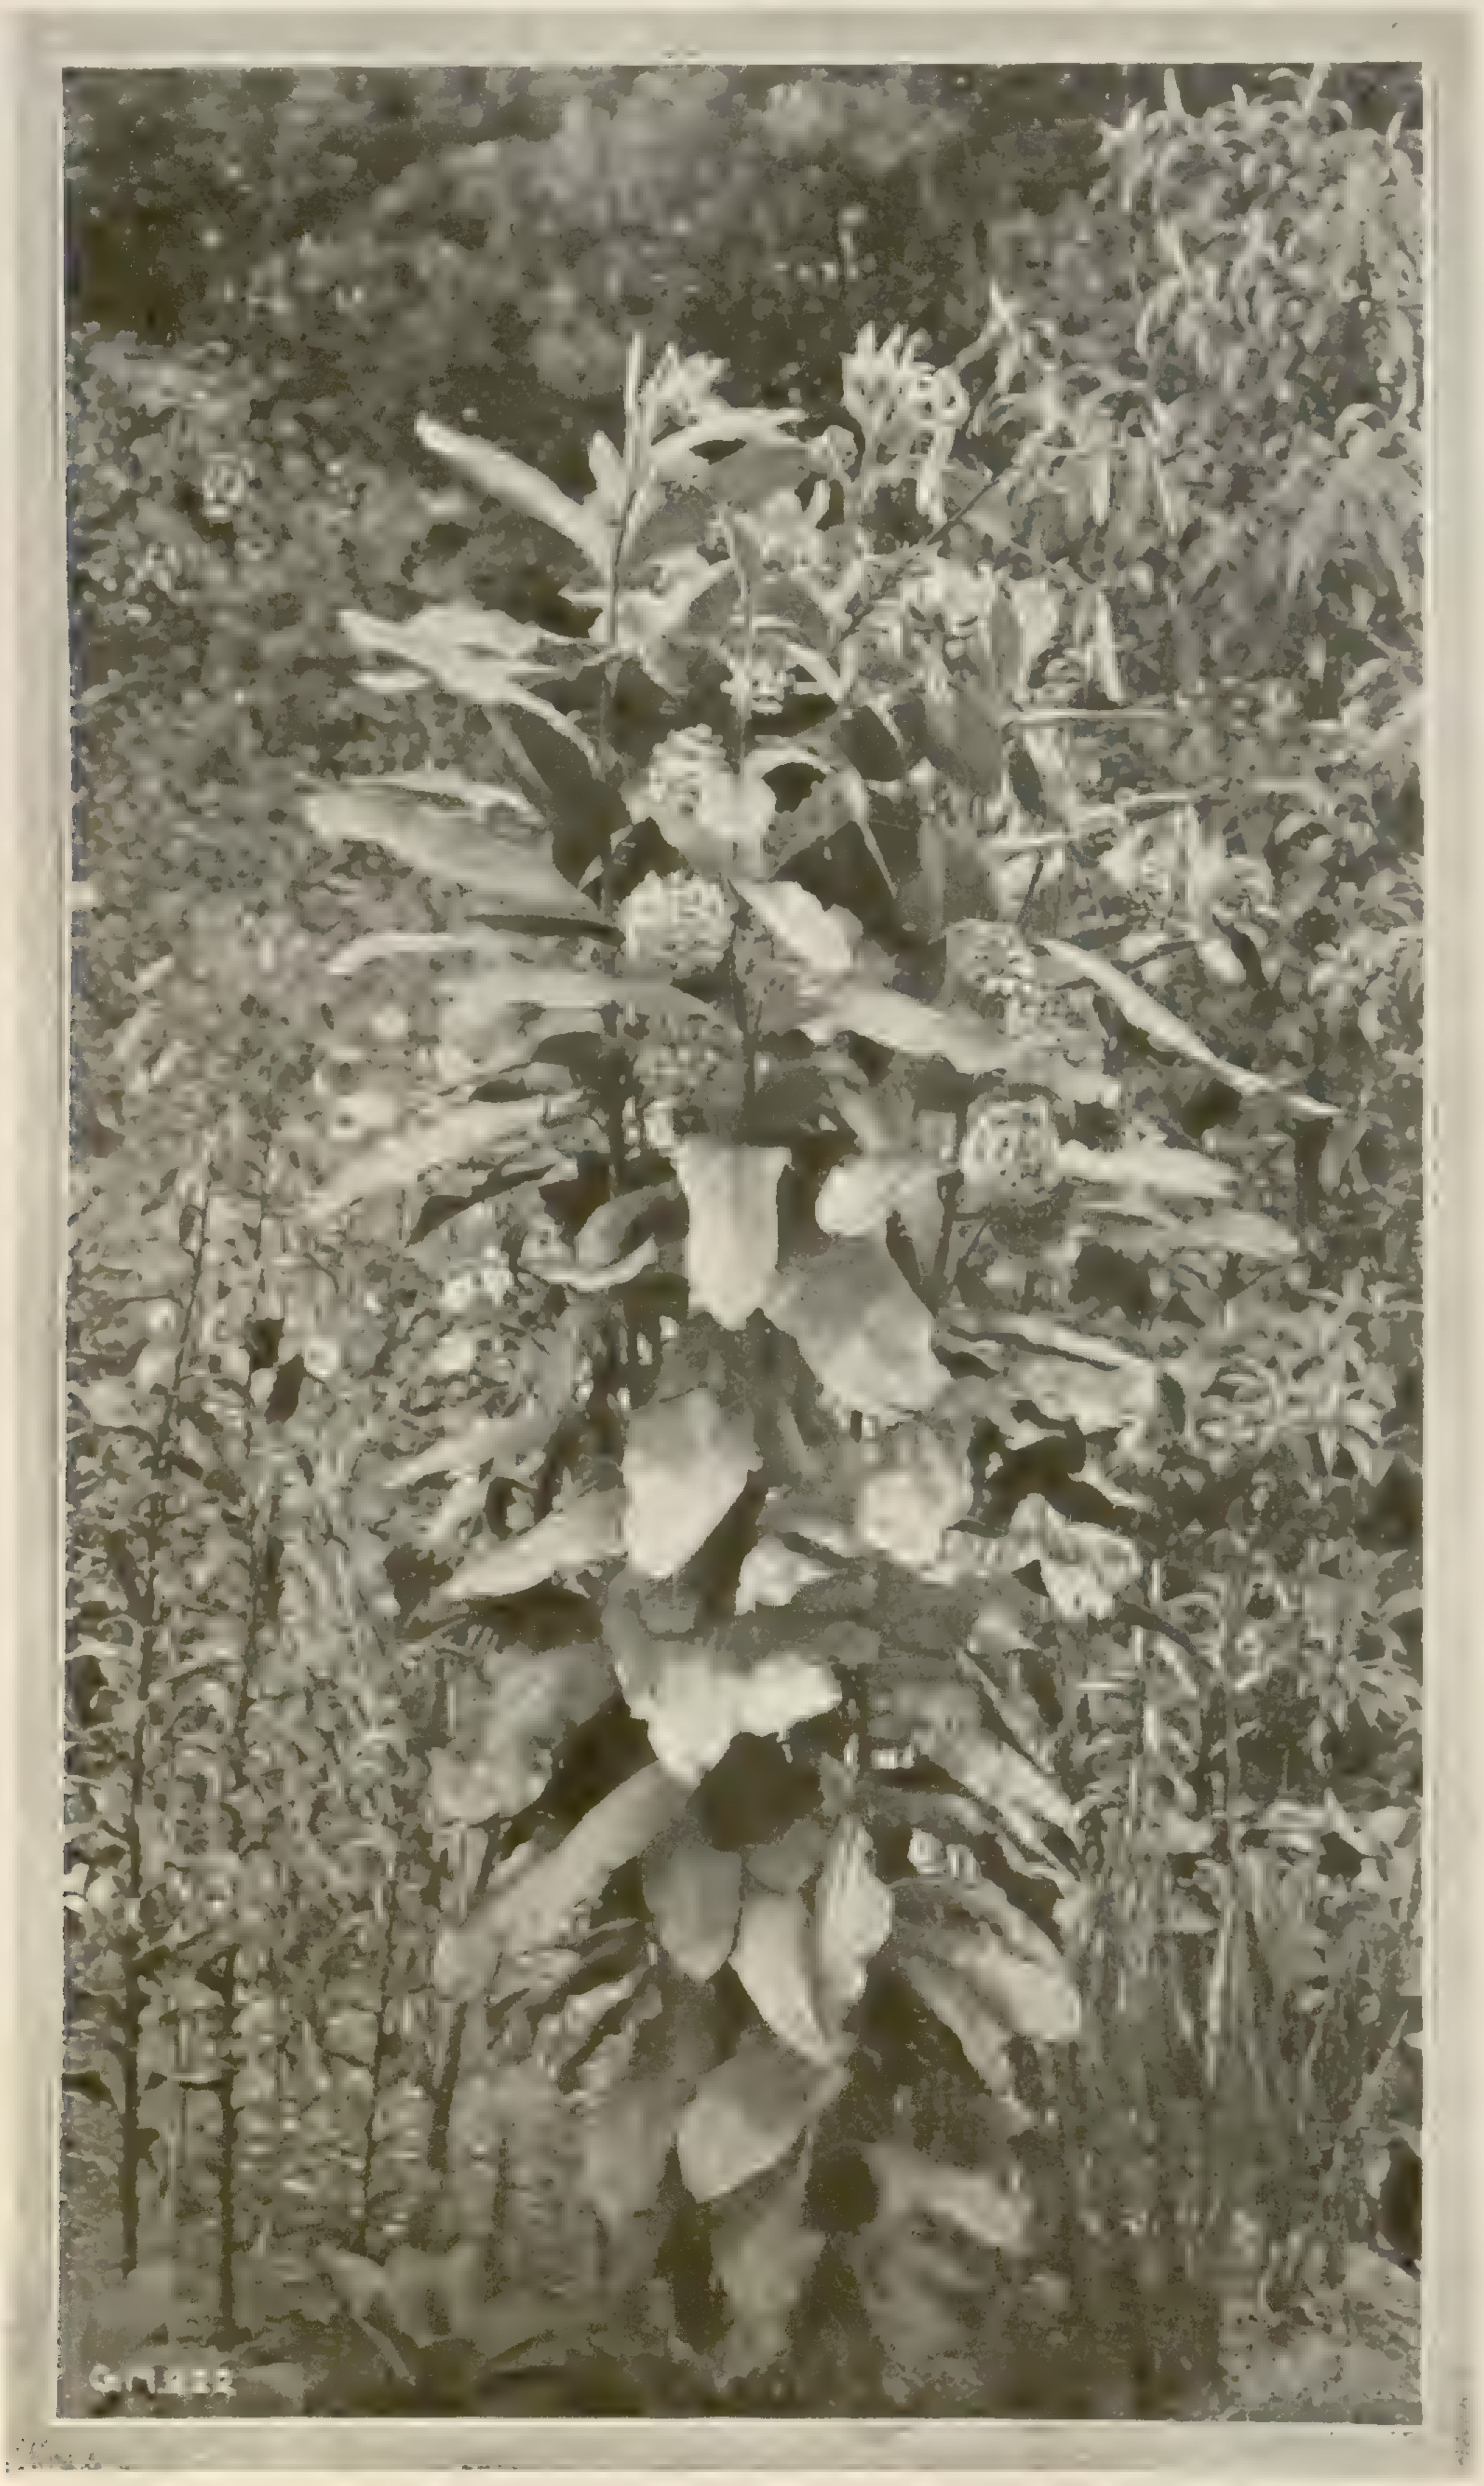
From an extensive inquiry into the subject of the quality of potatoes made by Mr. John W. Gilmore, of the College of Agriculture, Cornell, U.S., it seems that the culinary and dietetic quality of potatoes is not dependent upon chemical composition so much as it is upon the anatomical, and perhaps physiological, characteristics of the tubers and the arrangement and distribution of starch and water areas in the structure of the tubers.

The structural characteristic of the potato is influenced by the condition of the soil, and of the soil and atmospheric climate in which the potatoes grow.

As a result of these investigations we are led to believe that the quality and mealiness of a potato when boiled, and to a considerable extent the flavour also, is influenced in the main by the following considerations:

1. The daily range of soil and atmospheric temperature during the growing period.
2. The degree of ripeness of the tubers when the plant dies down.
3. The physical condition and type of soil.
4. The description of manure applied.

Harpenden. J. J. Willis.



ASCLEPIAS DOUGLASI.
Flowers dull red and yellow.

ASCLEPIAS DOUGLASI.

This plant is seldom seen in gardens, yet its noble appearance certainly renders it a valuable subject for introduction into the herbaceous border, it being well worthy of culture for its foliage alone. It will often exceed six feet in height, and its entire leaves are, in strong plants, a foot in length and four and a-half inches in breadth. A well-grown specimen is an extremely handsome object. Its flowers are not to be compared for effectiveness to those of Asclepias tuberosa, whose flat heads of brilliant orange-scarlet blossoms form glowing spots of colour in the border, but they have a quiet charm of their own.

It blooms in the month of August, bearing numerous rounded heads of small blossoms, some of the flower clusters having a circumference of close on twelve inches. The corollas, which are less than half an inch across, are of a yellowish tint, and the reflexed petals are of a dull reddish hue, the flower heads appearing at a little distance to be flesh-pink in colour. About two hundred blooms are contained in a single flower head. The blossoms are perfumed, and attract innumerable humble-bees and other insects, which soon become stupefied by the nectar and remain inert on the heads of bloom. It is a native of Western America, and is hardy. It is very tenacious of life, and if a plant is lifted shoots will be continually springing up from portions of the roots that were left behind when the specimen was shifted.

S. W. Fitzherbert.

Francoa ramosa.—Anyone who has a greenhouse should not be without a stock of the bridal wreath. The long racemes of white flowers are now just appearing; they have a very pleasing effect. It is also very useful for cutting, and lends itself readily to all kinds of decoration. I find it most satisfactory if raised from seed, which should be sown now in a light compost, and placed in a warm house. A great deal of care and attention is necessary during germination. When the seedlings are large enough to handle they should be pricked out into pans and kept in the same temperature till they require another move. If propagation from seed fails, and cuttings are available, these will readily strike in the propagating pit.—T. B. Field.

GATHERING DAFFODILS.

At this season of the year we are charmed by the beauty and variety of daffodils and amazed at the low price at which good blooms are sold in shop and street. We are entranced by the great drifts of trumpet, incomparabilis, Leedsi, and other kinds of daffodils as we see them in the grass or the woodland at Kew, Regent's Park, Totley Hall, Wilton Court, and other large places, and we greatly wonder at the huge breadths of glowing colour that daffodils provide for the traveller as he passes through or by some large nursery at this spring time of the year. But do we always remember what a large amount of labour the daffodil employs? There are planting, lifting, cleaning, storing, packing, and distribution to be considered with reference to the bulbs alone, while hundreds of women and children find employment in Guernsey, the Scilly Isles, Cornwall, Kent, Surrey, Worcester, and Lincolnshire, to go no farther north, during the season of flowers. Everybody knows that hosts of daffodils are picked when the buds show colour, and are expanded under glass, carefully packed, and despatched to the large centres of population, and also that as the days grow longer and the sun brighter the pickers gather direct from the fields and pack up the blooms in a cool shed. In the accompanying illustration a great field of trumpet daffodils, one of many at the floral farms of Messrs. R. H. Bath, Lim., Wisbech, is well shown. Such fields of finely flowered daffodils as the one herewith depicted are a glorious sight and worth the time and trouble of a long journey to Wisbech to see, because the Messrs. Bath do everything well and on a surprisingly large scale.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

SEASONABLE NOTES. — The weather in the north-east of England has been anything but favourable to the development of plant growth up to the time of writing. The almost total absence of sunlight, the cool winds, and the frosty nights are factors altogether detrimental to the cultivation of any class of orchids, for even the cool house kinds suffer when so much artificial heat is required over such a prolonged period as has been the case during the past few months. I do not trouble much about the retarding of growth, but where plants are carrying flower scapes, the strain thrown on the resources of the plants is heavy, owing to the great length of time they are taking to develop their flowers. We may find the ill effects more pronounced in our strongest plants, especially where these are flowering well. With such prospects, flower spikes should not be permitted to remain on the plants longer than is absolutely necessary after they have become expanded. Moisture, which under ordinary circumstances is decreased after the flowers have been removed, should be more liberally afforded, so that the plants may be afforded every encouragement to regain their normal plump state, especially where the strain of flowering has caused the pseudo-bulbs to become more or less shrivelled.

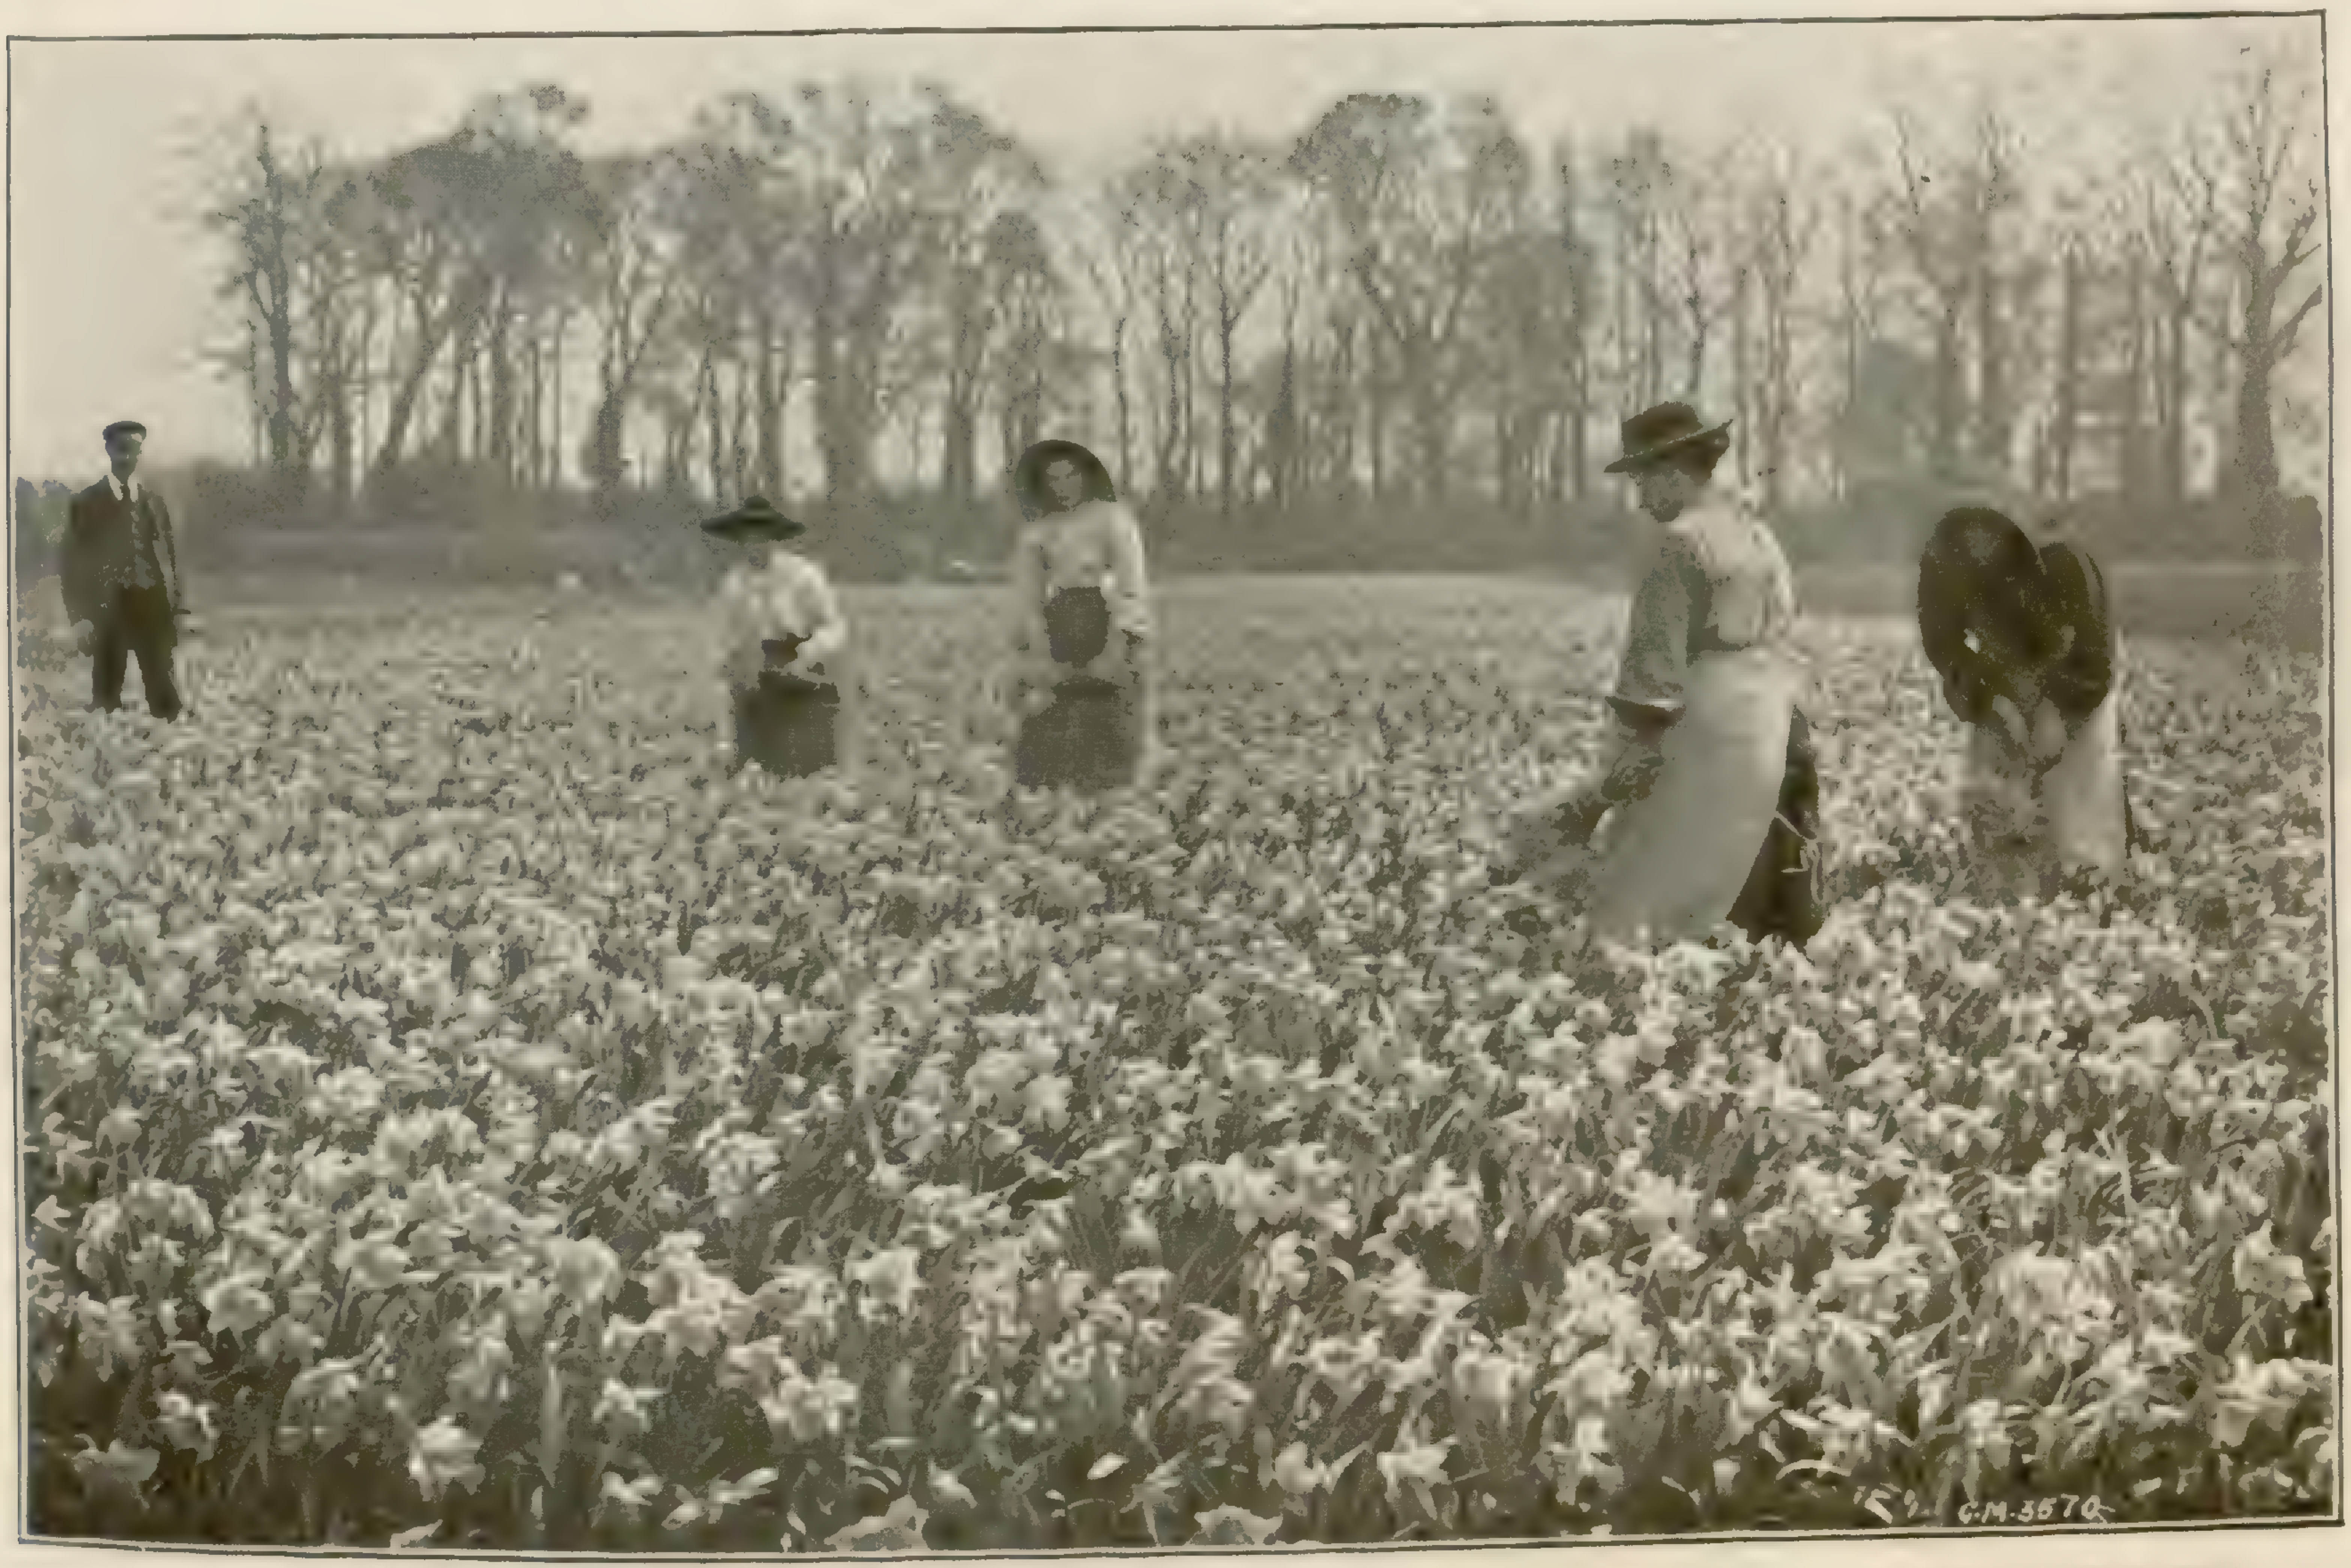
SHADING.—We shall all be glad to avail ourselves of every facility that may be derived from the benefit of light, but in a season like the present one cannot be too cautious. Having been so long without sunlight, strong light will now have the effect of rapidly ripening the leaves, and especially will this be so in the case of odontoglossums and other cool-house subjects. It is the aim of the successful grower of to-day to endeavour to retain as much foliage as he possibly can on the back growths of his plants; the effect of glaring light is to produce a bronzy, reddish-green colour in the foliage, and this is desirable so far as it goes, but it is easy to over-step the line, with the result that, after a few months, we find the leaves ripen off, and the back bulbs are left for ever leafless. Where leaves are sappy and green, as is bound to be the case in a season like the present, the blinds must be used with every discretion.

VENTILATION.—I have advocated for many years the use of the lower ventilators, in preference to the use of those on the roof. I consider there is less risk from cold draughts when air is admitted through the low leeward ventilators than is the case where the roof ventilators are used. Coming through the lower ventilators, the air is more or less warmed by passing over the hot-water pipes before reaching the plants, and in cases where houses are naturally dry, the opening of the roof ventilators only adds to the difficulty, for it permits the moisture in the atmosphere to escape. Where houses are naturally very damp, and excessive moisture becomes detrimental, then the conditions are altered, and the opening of the roof ventilators would be advantageous. In no case should both the roof and side ventilators be used at the same time.

DAMPING.—As the days grow longer, and with a prospect of better conditions prevailing outside, more moisture may be afforded. The floors, staging, and pots may be damped and syringed as often as the surfaces tend to become dry.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

IXORAS.—Plants raised from cuttings in the spring form useful decorative stock for the autumn, and for this purpose they are allowed to remain in five-inch or six-inch pots, and given regular applications of weak liquid manure and an occasional top-dressing of artificial manure. During their growing season ixoras require to be kept in a brisk temperature and moist atmosphere. As soon as they are growing freely pinch out the tips of the shoots to induce a bushy habit. Gradually inure them to the light as soon as they become well-established, and then give them as much light as possible, and grow them at the warmest end of the stove. Continue this



GATHERING TRUMPET DAFFODILS AT MESSRS. R. H. BATH'S FLORAL FARMS, WISBECH.

treatment, with the liberal use of the syringe, until the plants show signs of flowering. If, however, larger specimens are desired pinch out the tips of growth, and grow the plants steadily throughout the winter.

CYPERUS ALTERNIFOLIUS.—Where cut foliage and green-foliaged plants are in demand, this easily-grown cyperus will prove serviceable. When cut, the foliage remains in good condition for a considerable time, with an occasional change of water. Plants with numerous crowns may now be divided and put singly in small pots. They succeed well in ordinary loam, with a little sand added, and if regular attention is given to watering they will quickly develop into useful specimens. They are almost aquatic, and will succeed equally well if planted in a water-tank. There is also a variegated form of C. alternifolius, which, if well-grown, forms a handsome foliage plant, but if treated too liberally, it will quickly lose its variegation.

DIEFFENBACHIAS.—These are both useful and interesting, comparatively easy to grow, of pleasing habit, and ornamental leafage. Various methods are adopted for their propagation, and all with success. Cuttings may be placed singly in small pots, and plunged in bottom heat; or unsightly plants can be notched and mossed up, as the stems quickly form roots, and plants may also be raised by cutting the stems into lengths and placing them in a close case, as the eyes will soon produce growths. I much prefer to raise a batch of young plants annually, as they soon develop into a useful size for decorating. With the assistance of regular artificial feeding, large, single-stem specimens may be grown in five-inch and six-inch pots.

CALADIUMS. — Another batch of caladiums may now be started into growth, and those which are growing freely will require to be shifted into larger pots. For this purpose, which is generally the final potting, it is advisable to add a small quantity of well-decayed manure, which ought to be dried and passed through a fine sieve, and thoroughly incorporated with the potting compost.

GENERAL REMARKS.—Further attention must be paid to cleaning the stove plants, for if this work is neglected now it involves a very great amount of labour later on. The stove should be fumigated occasionally to check attacks of aphis or other insect pests. The floors and stages may be damped down each evening with liquid manure, which serves as a preventive to attacks of red-spider, and also proves beneficial to the occupants of the house.—JOHN DONOGHUE, Bardon Hill Gardens.

FRUITS UNDER CLASS.

EARLY VINERY.—Where the grapes are just commencing to colour, the vines should have a good watering, the state of the crop and border being first taken into consideration. If the vines are a few years old little manurial assistance is required. The house should not be quite closed after this period. The bunches should be examined for bad or centre berries. If the berries have not swelled to their proper size at this stage remove a few bunches. Red-spider should be sponged off if it appears on the leaves. Ties should be examined, in case they are cutting into the wood, especially in the case of rods tied up with tar string. Damping down should be continued on fine days, and a night temperature of 65 deg. with 70 deg. by day with air on, may be maintained.

PEACHES AND NECTARINES. — Under good condition these will be swelling fast, and assistance may be given, if necessary, with liquid manure. Weather permitting, syringe night and morning, closing the house early. Fumigate occasionally to ward off fly. The crop retained should not be more than the tree can finish off satisfactorily; fruits near a wire or underneath the trellis should be removed. Tying in of the shoots should be done, and all useless branches may be cut out to allow light to reach the growths required for next season's fruiting. If the borders are full of roots, they may be top-dressed with some stable manure, but this should be first thrown into a heap to heat and be turned a few times.

STRAWBERRIES. — Supplies will not be difficult to obtain now, providing the room for plants can be found as they ripen. If in a cucumber or melon house they should be put in a cooler structure to finish off, and this entails a lot of work, hence the need of having a good number now in cooler houses, and letting them remain till the fruit can be gathered. Thin the fruit out as soon as they have set, allowing each plant to carry six good fruits; liquid manure should be given frequently, and plants must not on any account become at all dry. Keep back a batch of plants for supply just before the crop ripens outside, as there is generally a gap, especially if the weather is cold and unfavourable.

TOMATOES.—Early plants in pots are now swelling their fruits, which will soon commence to colour. If a few are required at the earliest possible date, the plants may be stopped before they reach their limit; top-dress these with some good loam and bone-meal, and keep all side-shoots pinched off. In dull weather do not let the water stand about in the house, under the stages, from watering. Later plants will be ready for pots or planting out; they will probably be in seven-inch pots, and their first lot of flowers may be allowed to set. If the house is not ready to receive them, or other work is more pressing, maintain a night temperature of 60 degs., with ventilation. If the weather continues dull, it will be well to distribute the pollen with a brush, keeping this dry. Fumigate regularly to keep down white-fly.

BANANAS.—These in tubs are now throwing up their fruits, and copious supplies of both liquid manure and clean water will be necessary to feed them up. Blood manure is one of the best materials to give them for a change. Fruiting plants that have not been top-dressed with good loam and manure should be attended to without delay. Plants that were potted into 12-inch or larger pots should be given plenty of clear water. Any suckers that can be removed from the old plants before they become well rooted should be potted up. Keep the atmosphere well charged with moisture, and maintain a night temperature of 70 degs., rising to 75 or 80 degs. by day.—A. B. WADDS, Paddockhurst Gardens.

THE KITCHEN GARDEN.

PEAS that were planted out from pots and turves, as advised early in the month, should now have the permanent sticks placed to them, and if a mulching of decayed manure could be given, they would derive much benefit from it later on. These mulchings are most serviceable, and they save a considerable amount of labour in watering should the weather become hot, especially on light soils.

PEAS UNDER GLASS.—Batches that were sown early in the New Year in pots, and also planted in cool structures, will now be setting their pods, while those that are to follow in succession will be in bloom. Keep them in an upright position by staking them early. Those that are in pod may have a night temperature of 55 degs., and be syringed twice daily, giving them weak liquid manure three times a week, until they are nearly ready for gathering. It is astonishing how well peas do in cold frames, providing these are of a fair depth, and a dwarf variety is selected, such as Carter's Eight Weeks or Little Marvel.

CELERY AND LEEKS.—These two useful vegetables, if required early, should be well hardened off, and be ready for transplanting early in the month in the open ground. The best method is to plant them about a foot apart, in single lines, in well-manured trenches, giving them a little shelter if cold winds prevail. Attend well to spraying the plants on fine warm days until they become established.

RUNNER BEANS.—In a few more days the first sowing of these may be made out of doors on deeply-trenched ground that has had a liberal dressing of cow manure. Sow the seeds in a double row, and thin the seedlings out to about a foot apart. There are many improvements in varieties of this vegetable. I have tested many of them, and have found Scarlet Emperor the best. Some growers prefer to sow seeds in boxes or 3½ in. pots, harden them off, and plant out in the open when they are five or six inches high. This system answers very well, especially on cold, heavy soil, and in uncongenial climates.

TURNIPS.—A good sowing of these should now be made on a well-tilled quarter of the garden, and, as the ground is so very moist, the seeds will soon germinate. When the first rough leaf appears, a good dusting of wood ashes should be given, which will have a beneficial effect on the crop. Snowball is a good variety to grow, but where yellow kinds are preferred, Orange Jelly or Golden Ball should be sown.

VEGETABLE MARROWS. — The main crop for planting in the open ground should be sown at once, placing the seeds singly in 3-in. pots, and putting them in gentle heat. When the seedlings are up, they should then have a position well up to the glass to prevent them from becoming drawn. Make preparations for planting them out at the latter end of May. Pen-y-Byd, Moore's Cream, and the Custard Marrow are three good varieties to grow; they are not large, but of good flavour.

GHERKINS.—Where this small cucumber is required, it should have exactly the same treatment as advised for marrows, both as regards sowing the seeds and planting.

BROCCOLI.—A sowing of some of the earlier varieties of winter broccoli, such as Osborn's and Snow's Winter White, should be made now. Sow also a late batch of Brussels sprouts, Self-Protecting broccoli, more Walcheren cauliflowers, and cabbages. I rely on Early Heartwell and Ellam's Dwarf cabbages for summer use.

GENERAL REMARKS.—The Dutch hoe should be kept well at work, as it not only benefits the crops but checks weeds. Keep a sharp look-out for slugs, especially early in the morning. Peas that have just come through the soil should have three or four strands of cotton strung over them to keep the birds from eating the young growths.—T. W. BIRKINSHAW, Hatley Park Gardens.

Bog and Aquatic Gardens. — Where these are established, or planting of such is contemplated, now is the best time to attend to them. Avoid planting in too deep water, or (with very few exceptions) where a strong current is running. The course generally taken is to fix established plants in open wicker baskets, and sink in a suitable depth of water. If there is a good depth of mud or sediment in the bottom, not much else will be required. But with an artificial or hard, clean bottom, it is desirable to bank soil all around the baskets for the roots to ramify in. If the water can be lowered while working at aquatics, this should be done. Failing this, the operator should have a pair of fisherman's waders, as they will enable him to walk in the water and attend to the plants. The baskets should be carefully lowered into the water, and in their proper position. Tubs of aquatics also make pleasing objects, if sunk in the ground just below the rim of the tub, and in suitable positions in either nooks and recesses or on lawns. Old petroleum barrels, sawn in two, answer well for this purpose, and can be easily refilled as water is absorbed or evaporated. Tubs of Typha, Acorus calamus, Iris pseudo-acorus, etc., associate admirably with large plants of the old agapanthus. Bog and sub-tropical gardens seem so much allied to each other, or at least so many pleasing combinations may be made, that it seems difficult to say where one should end and the other begin, though this is largely determined by the formation of the ground. For some of the sub-tropicals, partially-shaded and well-sheltered spots are very helpful. They should not be put in an exposed or bleak position, but for the aquatics full sunshine is more desirable.—E. F. H[illegible]TON, Knowsley Gardens.

TREE FERNS.

The various species of tree ferns under cultivation are, with one or two exceptions, natives of New Zealand, and, consequently, succeed admirably in the ordinary greenhouse or conservatory.

Considerable numbers of the naked stems or boles are imported into this country every year, the majority being sold by public auction in London and the great provincial towns. They do not appeal to amateurs in this uninviting condition simply because many people are ignorant of their capabilities, and seeing what an object of great beauty results, provided correct treatment is given, the purchase of stems may be said to be a first-rate investment. No attempt should be made to force the boles into growth, and all that is required is to cover the thick end or basal part with moss, when it should be placed in the cool greenhouse and syringed twice daily.

In the course of a month or five weeks a quantity of roots will have formed, and have taken possession of the moss covering. It is important that they should then be put in small tubs or other receptacles, and as the presence of a large body of soil is inimical to their well being two inches of space between the boles and the sides of the tubs will be ample for the first potting.

Good fibrous peat and loam, in equal quantities, with sufficient sand and charcoal to ensure porosity and sweetness, represents the correct medium; the syringing of the stems must continue throughout, being regulated by the season and the plants' condition. Twice each day from spring to early autumn, and once during the winter is not far wide of the mark.

In their native habitats tree ferns are found in moist and shady spots, and although they are subjected to a considerable amount of strong light oftentimes under glass, the direct rays of the sun are positively harmful to them, therefore a thin tiffany shading must be provided, and in order to induce strong and vigorous growth atmospheric moisture is essential from the time the boles reawaken into activity in spring. It may be added that the root climbers often afford sufficient shade, when artificial shading may be dispensed with, and, further, that tree fern roots are of a stay-at-home nature, and it is neither necessary or advisable to afford them more than very limited accommodation.

As regards the application of stimulants, clear soot water is decidedly beneficial, and should be given when the plants are in active growth. It promotes growth and deepens the colour of the fronds. Minute quantities of sulphate of ammonia, about a teaspoonful in three gallons of water, is also to be recommended. Touching upon insect pests, scale is usually troublesome, and care and pains must be taken to dislodge it without inflicting injury upon the fronds, while thrips must be treated with an approved insecticide.

The species that succeed under ordinary greenhouse treatment include Dicksonia Youngi, D. squarrosa, D. cicutaria, D. antarctica, etc. Others that call for rather warmer conditions, or a temperate house, include Cibotium spectabilis, C. Schiedei, and C. princeps, also Cyathea medullaris and C. dealbata. Almost without exception these handsome subjects are benefited by living an out of door life from the beginning of July to the middle of September, but due attention must be paid to watering, syringing the stems, and, equally important, a very sheltered and shady spot should be selected, not forgetting to secure the tubs by means of stout wire. They can be utilised to play an important part in the sub-tropical garden and display.

WALTER H. AGGETT.

AMERICAN GOOSEBEREY MILDEW.

Recently Lord Carrington received at the Board of Agriculture a deputation composed of the following delegates from farmers' clubs in Kent: Mr. J. D. Maxted (chairman), and Messrs. G. Mount, W. W. Berry, and E. S. Salmon (mycologist to the S. E. Agricultural College, Wye), of the Canterbury Farmers' Club; Messrs. G. E. Champion, B. Champion, and T. Edmunds, of the Maidstone Farmers' Club; and Messrs. H. Chapman and S. Lee, of the West Kent Farmers' Club.

Mr. Maxted, in introducing the deputation, remarked on the seriousness of the possible introduction of the American gooseberry mildew into Kent, and on the large financial interests at stake in the county.

Mr. E. S. Salmon made the following statement, in representing the views and objects of the deputation:

Since the appearance in England of the American gooseberry mildew the outlook for owners of gooseberry plantations in Kent has been one of considerable anxiety. The heavy losses incurred in Kent through the ravages of the pest of black currants, known as the "big bud" mite, has made fruit-growers most anxious that every possible step should be taken to save the gooseberry crop from any similar damage.

The American gooseberry mildew is a pest, which, to quote the Board of Agriculture's own words, "has rendered the cultivation of gooseberries unprofitable wherever it has appeared, and in some cases impossible."

Kent is at present free from the disease, the single outbreak which was discovered in a nursery in November, 1906, having been stamped out at once by the owner, on the advice of Wye College, destroying the entire stock of affected bushes.

We feel strongly that, considering the annual value of the gooseberry crop to nearly all classes in the county, it would be a suicidal policy not to take every possible step to stamp out the disease at once if it should appear in the gooseberry plantations in Kent. We strongly desire that any outbreak in Kent should be dealt with at once by the compulsory destruction of all diseased bushes.

At the last meeting of the Kent County Council a resolution was passed unanimously that an application should be made to the Board of Agriculture for an order (to be issued now) to empower the Council, in the event of any outbreak, to order the grower to destroy immediately the diseased bushes, and not to allow the grower the alternative of pruning, as at present permitted by the Board's orders, issued to affected counties.

The Kent County Council passed a further resolution that, in all cases of compulsory destruction of diseased bushes, the grower shall receive some compensation, this compensation to be paid out of the rates only if it cannot be obtained from the Board of Agriculture.

We strongly support the action taken by the Kent County Council, and earnestly ask for such an order, so that every step may be taken beforehand in order to be able to deal summarily with the mildew if it makes its appearance. We urge especially that the burden of compensation should not be laid on the rates, and would point out that the proposal to do so (in the case of any outbreak) is already meeting with considerable opposition. We respectfully urge the justice of the claim put forward by Lord Harris at the meeting of the Kent County Council, that, as the Board of Agriculture pays compensation to the stock-owner for the slaughter of stock suffering from certain diseases, it is only right that the fruit-grower should be compensated from the same source. We point out that, under the "Destructive Insects Act" of 1877, compensation has in the past been paid by the Treasury in cases of the compulsory destruction of potatoes affected with the Colorado beetle.

Secondly, we recognise the importance of the fact that, if this mildew is not completely stamped out in the various counties already affected, it will only be a matter of time before the pest finds its way to Kent (and to the other counties at present free) in increasing quantity.

We regard it as a matter of paramount importance for all counties at present free from the mildew that the most drastic measures should be employed in all affected areas to stamp out the disease. We look upon the question as one of national importance, as the interests of every county are concerned. We submit that there is no scientific evidence that the measures of pruning and spraying at present permitted by the Board's orders are sufficient to stamp out such an infectious and epidemic disease as the American gooseberry mildew has proved itself to be in the United States, and since 1900, in Ireland, and on the Continent. We would call attention to the following statement published in the "Journal of the Board of Agriculture" for November last: "Not only have bushes previously affected been attacked again, in spite of all precautions, but bushes which last winter were believed to be free from disease have become affected, in spite of careful pruning, followed by regular spraying. It is clear that even pruning and spraying will not ensure immunity from disease." We urge, therefore, the employment of the drastic measures, involving the immediate destruction of all diseased bushes, which were embodied in the first order issued by the Board, but which, in the absence of any compulsory scheme of compensation, were found to be impossible to be carried out. But, while asking for more drastic measures to be taken in the affected counties, we are most anxious to state that we do not consider it equitable, or, indeed, possible, for such measures to be carried out without the payment of compensation. We are of the opinion that it is not equitable either that the compensation should be paid out of the rates, and we are convinced that, taking the counties of England as a whole, the drastic measures necessary for the stamping out of the mildew can be enforced uniformly only if compensation is given by the Board of Agriculture.

We earnestly ask, therefore, for an assurance that, if the American gooseberry mildew shows itself to any considerable extent this summer in the affected plantations in the various counties, in spite of the compulsory pruning and spraying which have been carried out under the Board's present order, the Board of Agriculture will substitute the original order, the destruction of all diseased bushes, the necessary compensation to be paid by the Board, and not out of the rates.

Mr. W. W. Berry laid stress on the importance of the matter from the labour aspect. Taking the acreage of gooseberries in Kent as 6,000 acres, he pointed out that the wages bill would be not less than £60,000 annually; and asked whether it was not worth while to spend a little in compensation in order to preserve so important a crop to the county.

Other members of the deputation spoke of the importance of gooseberry-growing to the small grower, whose plantation often represented a considerable part of his capital, and which could not be destroyed, if it became diseased, without the payment of some compensation.

Lord Carrington received the deputation sympathetically, and expressed the desire to do all he could to keep Kent free from the disease. The payment of compensation from Treasury funds was not at present possible, but the whole matter was under consideration. If the means adopted should prove during the course of the summer to have been ineffectual to stop the disease from spreading in the various affected counties, the Board would be prepared to take more drastic steps.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Ipswich Spring Show.

APRIL 21 and 22.

The Ipswich and East of England Horticultural Society chose, unfortunately, a very late and bad season for the resuscitation of its spring show, but in spite of distinctly unfavourable conditions the exhibition, held on the above dates in the Public Hall, was a very attractive one. The competition in the daffodil classes suffered considerably, as a consequence of the untoward season, but the exhibits staged were alike a testimony to the keenness and ingenuity of the exhibitors and to the beauty and magnetism of our spring flowers. We imagine that very few of the daffodils shown were expanded out of doors; indeed, there was ample evidence that not a few of the flowers had been opened under glass under the influence of considerable warmth. However, the exhibition, as a whole, was a very bright and interesting one, and we sincerely hope that Mr. W. F. Paul, the president, and Mr. Harold Smith, the new secretary, will have other and larger spring shows to conduct in the coming years.

CUT BLOOMS.

There were no entries whatever in the trade class for fifty varieties of daffodils, and only one entry in the class for five-and-twenty varieties, and here a first prize was awarded to Mr. A. Sparke, gardener to F. L. Bland, Esq., Copdock, near Ipswich, who had a fairly good set, that included Madame Plemp, Glory of Leiden, Gwyther, Lucifer, Emperor, Princess Mary, Lulworth, and albicans. The same exhibitor was placed first for twelve bunches of daffodils, four blooms to a bunch, though he had a less attractive display than that set up by Mr. H. G. Strutt, gardener to W. P. Burton, Esq., Edge Hill, Ipswich, who was second, and confined his attention almost exclusively to trumpet varieties. Mr. Sparke had good flowers of Stella superba, J. B. M. Camm, Madame Plemp, Lulworth, Mrs. W. Ware, and Minnie Hume. Mr. Strutt's best examples were Glory of Leiden, Emperor, Empress, J. B. M. Camm, and Golden Spur. Three competitors entered in the class for six bunches of trumpet daffodils; here Mr. D. Jamin, gardener to Captain W. O. Cautley, Bury St. Edmunds, was a good first with very clean, well developed blooms of Victoria, King Alfred, Madame Plemp, M. J. Berkeley, Glory of Leiden, and Duke of Bedford; Mr. H. G. Strutt came second, and Mr. A. Sparke third. First prize for three bunches of trumpet daffodils likewise fell to Mr. D. Jamin, who set up his flowers of Horsfieldi, Glory of Leiden, and Madame Plemp in tall green metal vases that made them the more attractive. The best three bunches of bicolor daffodils were also from Mr. D. Jamin, who had rather smaller flowers here of Horsfieldi, Victoria, and Madame Plemp; Mr. H. G. Strutt second, and Mr. A. Sparke, third.

In the incomparabilis section Mr. D. Jamin scored for six bunches with moderate blooms of Sir Watkin, Duchess of Westminster, Princess Mary, Retainer, Vesuvius, and Stella superba; Mr. H. G. Strutt came second, and Mr. A. Sparke third. For six bunches (amateurs employing one gardener only), Mr. G. H. Saville was placed first with a rather weak set that included White Lady.

For three bunches of flat-cupped daffodils Mr. Saville led with Chaucer, Cassandra, and the Poet's narciss; Mr. A. Sparke was second. For a vase of twelve blooms of a Leedsi daffodil Mr. A. Sparke scored with Minnie Hume, and Mr. G. H. Saville came second with Duchess of Westminster, Captain Cautley coming third. The best vase of twelve blooms of Sir Watkin was the one shown by Mrs. Donald Warnes, Bramford, near Ipswich, Mr. G. H. Saville coming second, and Mr. A. Dunnett, gardener to G. Dow, Esq., Hasketon, third, in a good competition. Barri daffodils were poorly shown, Mrs. Warnes and Mr. Sparke coming first and second respectively for a vase of Barri conspicuus.

Twelve distinct narcissi, one bloom of each (amateurs), made an interesting class, and here Mr. A. Sparke was a good first with Glory of Leiden, Albatross, Weardale Perfection, Lady Godiva, Lucifer, Blood Orange, Gloria Mundi, Seagull, Cardinal, Fusilier, Apricot, and Peach. Mr. D. Jamin was second, and Mr. G. H. Saville third. In a small class for six varieties Mr. Saville was first and Mr. W. Bradbury second.

Mr. Dunnett, gardener to R. Dow, Esq., Hasketon, scored for six bunches of spring flowers, with daffodils, tulips, hyacinths, Megasea Stracheyi, and pansies; Mr. W. C. Moores, gardener to W. F. Paul, Esq., second.

PLANTS AND GROUPS.

Herbaceous calceolarias were fairy good though some of the plants were rather drawn up; Mr. W. C. Moores was easily first for six pots, and Mr. J. S. Clarke, gardener to W. Pipe, Esq., The Lodge, Rushmere, Ipswich, second. Mr. Moores led for stellate cinerarias, but he must have been very little in front of Mr. J. S. Clarke. Mr. J. S. Clarke led for six azaleas with small, but very beautiful, examples; Mr. W. C. Moores second, and Mr. C. Chastney, gardener to V. D. Colchester, Esq., Ipswich, third. Spiræas were a strong feature, Mr. Strutt scoring in two classes for these elegant plants. Mr. J. S. Clarke had the best half-dozen cinerarias, Mr. Dunnett taking second place. Mignonette was good, Mr. J. S. Clarke again leading, and showing sturdy plants carrying fine heads of fragrant bloom; Mr. Dunnett second, and Mr. H. G. Strutt third.

Mr. Dunnett led for tulips in pots, but both Mr. Chastney and Mr. Moores showed well in this class, the latter showing six pots of Goldfinch. Mr. Saville gained first place for three pots of daffodils, Mr. E. Dunnett coming second. Mr. W. Dunnett had the best four pots of daffodils, and set up a fine exhibit of trumpet varieties; Mr. E. Dunnett was second.

Three groups of miscellaneous plants were arranged in front of the stage, and the one set up by Mr. H. G. Strutt was accorded the first prize; this produced by far the best colour effect, cinerarias and mollis azaleas being its prominent features; Mr. J. S. Clarke came second with arum lilies, cinerarias, calceolarias, etc.; Mr. H. J. Southgate gained the third award. All three groups lacked something in elegance and artistic arrangement.

Floral arrangements of daffodils were numerous. Mrs. Hill had the best vase of blooms—Sir Watkin. Mrs. Saville, using this popular variety, had the best basket of daffodils, and Miss M. Snell showed the best bowl of blooms.

NON-COMPETITIVE.

The leading non-competitive display was a large group artistically arranged in the centre of the hall by Mr. R. C. Notcutt, The Nursery, Woodbridge. This consisted of standards of Prunus triloba, viburnums, lilacs, laburnums, Cytisus Andreanus, and various roses. Under these were groups of magnolias, various hydrangeas, Primula obconica, mollis azaleas, lilacs, Spiræa confusa, genistas, and White Pet and Madame Levavasseur roses. Mr. Notcutt had also other displays of daffodils and alpines.

A group of well-grown cyclamens, Japanese maples, crotons, and herbaceous calceolarias, set up by Mr. W. E. Moores, gardener to W. F. Paul, Esq., Orwell Lodge, Ipswich, was very highly commended. Messrs. Barr and Sons, Covent Garden, arranged a small group of cut daffodils that included Blackwell, Duke of Bedford, Apricot, Ariadne, and Ray Smith. From Messrs. R. Wallace and Co., Colchester, came a collection of fritillarias, tulip species, muscaris, primulas, and cut daffodils. Messrs. F. Cant and Co., Colchester, set up a very fine exhibit of pillar and other roses, the freely-flowered examples of Dorothy Perkins, Crimson Rambler, Minnehaha, Tausendschon, Leuchtstern, and Hiawatha being greatly admired. Mr. C. H. Buck, Tresco Nurseries, Ipswich, contributed a group of carnations, pelargoniums, forced shrubs, etc.

Royal Caledonian Horticultural Society.

APRIL 15 and 16.

The Council arranged to hold its spring show some four weeks earlier than usual this year, but, perhaps, unfortunately, chose dates too near to Easter to ensure a financial success, though, as regards the material exhibited, there was only a slight falling off.

The chief class was for a group of plants, and Mr. Knight, gardener to Sir Wilfrid Lawson, Brayton, was successful with a nice arrangement of the usual class of plants, the second prize going to Mr. Wood, gardener to James Buchanan, Esq., Canaan Lane. Table groups of orchids made a pretty display, though there was nothing outstanding among the plants. Mr. Sharp, Freelands, Forgandenny, was easily first, and Mr. D. Mackay, Viewbank, Lasswade, second. Mr. Sharp was first also with four plants and a single orchid, these being also well shown by Messrs. Finlay, Wood, and Honeyman.

Roses in pots, though not large, were nicely bloomed, Messrs. Thom, Parlane, Young, Davidson, and Calder being the chief contributors. Among other things were many gay cinerarias, Mr. Galloway, of Gosford, being the most successful prizewinner. Amaryllis, astilbes, palms, stove and greenhouse plants, cyclamens, zonal pelargoniums, gloxinias, alpines, auriculas, etc., were all staged, but none of them were such as to necessitate special notice, and some were unworthy of the show.

Cut flowers formed a small portion of the exhibition, but there were some good roses, the twenty-four blooms and twelve blooms from Mr. W. Parlane Row, being fine. Mr. Knight was first for twelve Gloire de Dijon, and Mr. Pearson, Beechwood, for twelve Marechal Niels. Mr. Pirie, gardener to C. Cowan, Esq., Dalhousie Castle, set up twelve bunches of narcissi, finer than usual. In this section were also carnations, tulips, bouquets, and stove and greenhouse flowers. For a decorative dinner-table there were five entries, the first prize being awarded to Mr. Davis, Ballathie, for a mixed arrangement; Mr. Kidd, Carbery Tower, came second with a pretty arrangement of Madame Falcot roses, and Mr. Davidson, Kinloch, third, with Madame A. Chatenay roses, fresh and lovely. There was the usual criticism regarding the judging of these tables, but each exhibit had its weak point, which made the arrival at a decision pleasing to everybody an impossibility.

Mr. Galloway, Gosford, was the sole exhibitor of fruit, and he showed two dishes of strawberries, to which first prize was awarded. Of vegetables there was not a large quantity shown. Mr. Stuart, Thirlestane, Lauder, was first for a collection of six kinds, in which were good peas, kidney beans, and new potatoes.

The prizes for a plan of a garden, open to young gardeners, went to Mr. J. W. Forsyth, Dunis House Park; Mr. D. T. M'Kinlay, Dalkeith; and Mr. J. M. Webster, Bothwell Castle, in order of mention.

The trade exhibits included a nice lot of daffodil blooms from Messrs. Barr and Sons, Covent Garden, to which a gold medal was awarded. Outstanding varieties were Lady of the Snows, Maggie May, Charm, Apricot (F.C.C.), Bedouin, Peter Barr, Duke of Bedford, Fire Flame, and many others. Other exhibits of daffodils were from Messrs. Hogg and Robertson, Dublin (silver-gilt medal), and the Lissadel Bulb Farm, Sligo (silver-gilt medal). Messrs. Cunninghame, Fraser, and Co., Comely Bank, for a grand display of rhododendrons and alpines received a gold medal. Messrs. W. Cutbush and Sons, Highgate, gained a similar recognition for an extensive group of flowering plants, roses, carnations, etc., and Messrs. R. B. Laird and Sons, Pinkhill, gained a gold medal for an artistically-arranged group of flowering and foliage plants. Mr. John Forbes, Hawick, staged delphiniums, pæonies, phloxes, etc., and was awarded a silver medal. Mr. Downie, Beechhill, having the like award for a very large group of spiræas. Bronze medals were awarded to Messrs. Storrie and Storrie, Glencarse, for a fine collection of Primula obconica; to Messrs. Dobbie and Co. Rothesay, for pansies, primulas, etc.; and to Mr. Gerald Roche, Gowran Castle Gardens, Kilkenny, for anemones. Messrs. Wood and Co., London, showed horticultural sundries. A nice collection of new orchids was staged by Mr. McLeod, Chorlton-cum-Hardy, and a few from Messrs. Keeling and Son, Bradford. Messrs. Shanks and Co., lawn mowers. An Award of Merit was bestowed on Primula Angusi, from Mr. Angus, Penicuick.

Sydenham and District Gardeners' Guild.

A very interesting and instructive lecture on the "Small Holdings and Allotments Act, 1907," was given at the fortnightly meeting on Friday evening, at the Parish Hall, Wells Road, Sydenham, to the members of the above association by Mr. J. W. Owsley, I.S.O., barrister-at-law.

The chair was taken by one of the vice-presidents, Mr. H. J. Luff, who was supported by Mr. T. W. Stevens (the chairman of the Guild), Mr. F. C. Squire, Mr. Robert Wells, Mr. E. D. Ede, Mr. H. Hedges, Mr. Willoughby, Mr. Baker, Mr. W. H. Walker, Mr. W. H. Brown (secretary), and others.

The lecturer drew attention to the various advantages likely to accrue from the passing of this Act. He believed that a genuine attempt was being made, irrespective of political party, to give the Act a fair trial. One of its main objects was to induce the labouring man to remain on the land, and to encourage those who had migrated into the towns to return to the land. It was admitted on all hands that a depopulation of the rural districts had, to the detriment of the manhood of the country, been going on for many years from various causes. The problem before them was, whether the provisions of the Act could reasonably be expected to remedy this unfortunate state of affairs.

The machinery of the Small Holdings Act, 1892, was permissive only, whereas the new Act introduced the element of compulsion, in cases where the County Councils, or the Parish Councils, declined to put the Act into operation. The Board of Agriculture constituted the Central Authority, with whom rested the preliminary inquiries and the duty of approving schemes or establishing them where the County Councils made default.

Under the Act, a small holding was defined as "land which exceeded one acre and did not exceed fifty acres." A small holding was procurable as an allotment from the Parish Council. Power was also given to erect buildings on a small holding or to adopt existing buildings. The lecturer also mentioned that Parliament had voted a sum of £100,000 for the purpose of facilitating the carrying out of this important measure, and as during the next twelve months probably half a milion of money, or thereabouts, will be voted. considerable financial assistance will be able to be given to Councils which show a genuine desire to create small holdings and allotments. The lecturer read extracts from the model rules which had been drawn up by the Board of Agriculture for the guidance of the Councils.

Reference was also made to the French peasantry, who were the backbone of their country, and to their system of intensive cultivation, and also to the "Daily Mail" experiment in stocking a farm of fourteen acres and placing in it a tenant who had been a clerk all his life. The lecturer considered success assured in the case of allotments up to five acres, which would be taken up as an adjunct by those in the country who had other employment to rely upon. Even around London the movement was going strong. In West Norwood there were 108 cultivators on twelve acres, 201 on 21 acres in Plumstead, and similar allotments in East and West Ham. But as to larger holdings taken up as a sole means of livelihood, the lecturer expressed himself as doubtful, and invited the views of the members present on the feasibility of the working of the Act.

Mr. Robert Wells, in a spirited address, said he anticipated failure, on the ground that there would be too much superintendence, and that there would be a difficulty in disposing of the produce, and advocated the formation of central markets with easy access. Mr. H. Hedges took a contrary view, believing that the holders should trust each other, and adopt co-operation, and select one of themselves to act as agent for the others in disposing of the produce.

Mr. W. H. Walker gave an interesting account of his experiences in South America, and instanced an example of intensive culture by a Chinaman there. He also gave statistics showing that there was a great demand for land.

Mr. T. W. Stevens, Mr. Baker, and others spoke, giving general support to the Act.

At the close of the lecture an animated discussion ensued amongst the members, the majority of whom expressed their opinion more or less favourably as to the Act. In proposing a vote of thanks to the lecturer Mr. F. C. Squire stated that he considered the society owed Mr. Owsley a very heavy debt of gratitude for the pains he had taken in dealing with the subject on such an exhaustive scale, and for the very interesting and valuable lecture he had given them. He observed that our French neighbours had long since discovered the benefit of petit culture, which had always been a great success, and it had seemed curious to him that we had been so slow in following the example of that country, as he thought it must be obvious that when a person concentrated attention on a small area of land, as compared with a large area, the small area was likely to yield relatively larger and better results.

The vote of thanks was seconded by Mr. E. D. Ede, in a few well-chosen remarks, and was carried unanimously. It was acknowledged in suitable terms by Mr. Owsley, who stated that he had learnt much from the discussion. A vote of thanks to the chairman, moved by Mr. Robert Wells, and seconded by Mr. Willoughby, concluded the proceedings. The next meeting of the guild will be held on Friday, May 1, when Mr. Baker will read a paper on "Fruits under Glass."

British Gardeners' Association.

At the Executive Council meeting, held on April 14, twenty-four new members were elected, bringing the total up to 1,211. The secretary was deputed to address a meeting at Blackburn on the 15th inst. The draft report of the annual meeting was considered and amended, as was also the report of the Sub-committee on Examinations. A reference to the conditions of employment at Kew was made, and will be considered by the Executive Council when the alleged grievances are submitted in writing.

On Wednesday, April 15, a meeting of gardeners was held at the Eccles Rooms, Blackburn, under the chairmanship of Mr. Stradford, superintendent of the Corporation parks. He was supported by Mr. Batty, head gardener at the Corporation Cemetery; Mr. Hudson, superintendent of Queen's Park; Messrs. Boyd, Pimlott, Marshall, Winter, Bradburn, Murray, and about sixty other gardeners. Mr. J. Weathers, general secretary of the B.G.A., delivered an address upon the work, aims, and objects of the association, and was listened to with marked attention. He pointed out that although gardening was the oldest profession in the world, those who exercised it were amongst the most disorganised and indifferently paid class of workers in the kingdom, and this, notwithstanding that horticulture had reached a degree of success and affluence never before excelled. It was being continually stated that "gardening was a luxury," as if the intention was to hint to gardeners that unless they put up with existing conditions they would be dispensed with altogether. To show the absurdity of the statement, Mr. Weathers asked what would happen to all the public and private gardens and parks, the nurseries and market gardens, and the flower shows, if all the gardeners in the kingdom were to cease work for only a month or two. It would mean a loss that could only be reckoned in hundreds of thousands of pounds. Gardeners, however, were reasonable men, and all they required were fair conditions of employment, and payment in accordance with their ability and the experience it had taken them years to acquire.

The British Gardeners Association was established, said Mr. Weathers,to help the professional gardener to secure better recognition, and also to be a help to employers in selecting men who understood what gardening meant. At the present time many excellent positions in the horticultural world were held by unqualified men, and there was no reason why gardeners who were competent should not aspire to these positions. For, after all, no horticultural society, organisation, or anything else connected with gardening could succeed without the help and co-operation of the practical man. The lecturer hoped that Blackburn that evening would set an example, not only to Lancashire, but to the rest of the country, and establish a strong branch of the British Gardeners' Association, so that gardeners and employers of gardeners would be brought into closer and more friendly relations.

After numerous questions had been put and answered it was decided to form the Blackburn branch of the B.G.A., and about sixty gave in their names for membership. Mr. Stratford was elected chairman, and Mr. Batty secretary, and the committee will be appointed at the next meeting, after all forms have been submitted to and passed by the Executive Council in London.

Croydon Gardeners' Society.

One of the benefits of the union of gardeners' societies is the interchanging of lecturers, and in return for a visit paid by a lecturer from the Croydon society to Chelmsford, Mr. W. Seabrook, a delegate from that association, visited the Croydon gardeners on Tuesday last, and was accorded a most hearty welcome.

Mr. Seabrook gave a lecture on "Growing Peaches and Nectarines." These popular fruits are, to Mr. Seabrook's idea, very easily grown, providing one pays attention to detail. Shallow planting he advocated strongly, and the subsoil must be well drained to take the soakings of water which they require. For young trees he does not recommend a rich soil, but good fibrous loam with the addition of a little bone-meal is all that is required. Planting firmly is very essential. The growths should be trained four to six inches from each other, which will allow light and air to pass around the fruit. Disbudding when growth is about an inch long he had found to be serviceable. Just before the flowers open he advised spraying with quassia and soft soap, and this remedy may be adopted at intervals to keep down aphis and other insect pests. As soon as the leaf-buds commence to expand, soak the roots well with water. Thinning the fruit should be done on two occasions, finally leaving one fruit to each square foot of tree area. Manuring should be moderate till stoning is completed, then ample feeding may be gradually given. A remedy he practises for the leaf-curl is pinching out the parts affected on its first appearance. Some of the varieties he recommended were: Waterloo, Early

Rivers, Hale's Early, Crimson Galande, Dymond Barrington, and Walburton Admirable.

A short discussion followed his discourse, and to all questions asked he gave adequate replies.

Some good exhibits came from the members, Mr. A. Edwards staging three pots each of double cinerarias and Rubra maxima tulips; Mr. F. Oxtoby, two pots of schizanthus and two well-grown azaleas, and a choice collection of orchids, including some well-flowered dendrobiums from Mr. M. E. Mills.

Birmingham Gardeners' Association.

The terminal fortnightly meeting of the spring session was held on the 13th inst., when Mr. W. L. Deedman (the secretary) essayed "A Chat about Ferns." Mr. Walter Jones presiding. Mr. Deedman, who, by virtue of his many years as foreman in the Botanical Gardens, Edgbaston, was specially qualified to deal with the subject, did so in an interesting and practical manner. The discourse led to a very interesting discussion that was much appreciated by Mr. Deedman. The lecture was illustrated by a series of dried fern fronds, brought by Mr. Wm. Gardiner. These were chiefly of hardy kinds, and proved very interesting.

The Chairman, in referring to the relative value of ferns staged for exhibition purposes, deplored the fact that they had for several years past gradually lost public favour, likewise by some judges at shows; also a similar pronouncement applied to other specimen plants. Unfortunately, meritorious plants that were difficult to cultivate, and required several years to grow into specimens, were often ignored for something new and rare by certain judges, and who had a prejudice in favour, possibly, of some kind of easily-grown and showy flowering plant. This was endorsed by Mr. A. Cryer, who remarked that of late years he had noticed a growing disposition on the part of some judges to ignore the merits of certain plants of a rare or of a difficult nature to cultivate, in favour of those more showy, but easy to cultivate. Votes of thanks were respectively accorded Mr. Deedman and Mr. Gardiner.

United Horticultural Benefit and Provident Society.

The quarterly meeting of this society was held at the Horticultural Hall, Vincent Square, Westminster, on Monday evening last, Mr. Charles H. Curtis in the chair. Five new members were elected, making a total of 30 during the quarter. Sickness has been heavy, but rather less than during the first three months of 1907. Several cheques were passed, being payments to members over 70 years of age, and others, including a payment of 2s. to a member who lapsed thirty years ago. Members over sixty years of age are now allowed to withdraw the interest on their deposit account, and several avail themselves of this privilege, as it enables them to pay their subscriptions more easily. The committee trust that many young gardeners will join the society during the year. Rules may be had from Mr. W. Collins, 9, Martindale Road, Balham, S.W.

Redhill and Reigate Gardeners' Association.

The Redhill and Reigate Gardeners' Association held its fortnightly meeting at St. Matthew's Parish Room, Redhill, on Tuesday, Mr. Seaman presiding; one new member was enrolled.

Mr. R. S. Ragg, B.A., head master of the Reigate Grammar School, gave a very instructive lecture on "The Pear Midge," with a view to the mitigation of that pest. He had found that spraying with paraffin emulsion was of little or no use, because after immersion in pure paraffin for over twelve hours they, the larvæ, were none the worse. Quicklime will not prevent them from penetrating the soil, even if half an inch is applied. The best method he knew was hand picking, which should be done from the third week in May to the second week in June.

A good discussion followed, one member remarking that the period named was an especially busy time of the year, and employers should employ their men overtime so as not to interfere with the regular order of work.

On the motion of the Chairman, seconded by Mr. Herbert, a very hearty vote of thanks was accorded the lecturer.

Woodford Horticultural Society.

A most interesting and instructive lecture on "Carnations" was given at the Memorial Hall recently by Mr. Montagu C. Allwood, carnation specialist to Messrs. Hugh Low and Co., Enfield. He dealt with his subject in a most practical manner, showing the remarkable strides that had been made in the improvement of the flower. He gave due credit to the Continental raisers, also to the Americans, but showed that England was now taking her part in making the flower popular. The lecturer described the culture of the three sections into which the various germs are divided, viz., the border carnation, the Malmaison, and the perpetual-flowering, and displayed some very fine blooms of the latter on stiff stems, which he had brought with him, and with the aid of growth showed the method of layering and propagation by cuttings. Mr. Allwood strongly advised growers to take up the raising of seedlings, and explained the art of fertilisation of the flower.

A very hearty vote of thanks was accorded the lecturer, and the Chairman, Mr. W. A. Hudson, very kindly promised to arrange for prizes to be offered for carnations at the next exhibition of the society.

South - Eastern Agricultural College, Wye.—A meeting of the governors of the South-Eastern Agricultural College was held at Wye on the 13th inst., Lord Ashcombe presiding. The resignation of the vice-chairman, Mr. George Marsham, was accepted with sincere regret, and Mr. F. S. W. Cornwallis was appointed in his stead. The Principal (Mr. J. R. Dunstan) reported an attendance of 122 students for the spring term, and that 123 had already entered for the summer term, commencing on June 1. The establishment of professorships of agriculture and agricultural zoology in connection with the London University is under consideration. Members of the college staff are actively engaged in research work in mycology, soil bacteriology, animal digestion, frost protection of orchards, and other problems of agricultural and horticultural importance.

Burchellia capensis.—Just now a bush of this burchellia, freely laden with blossoms, in the Mexican portion of the temperate house at Kew, shows its value for the embellishment of the warm greenhouse at this season of the year. Its flowering period, though, is by no means limited to the early spring for I have often seen it in bloom at other times. This burchellia forms a freely branched shrub, clothed with oppositely arranged ovate leaves, about four inches long and of a rich green tint. The flowers, which are borne in clusters on the points of the preceding year's shoots, are of a somewhat inflated tubular shape, a little over an inch long, and of a deep orange-scarlet colour, a very effective tint when viewed against a dark background, or during the dull weather of which we have had so much of late. It is not at all a difficult subject to strike from cuttings of the half-ripened shoots, and the young plants grow away freely in a mixture of loam, peat, and sand. This species was introduced during the early years of the last century, so that, though seldom seen, it is by no means a novelty. It is also known as Burchellia bubalina (buffalo), as its wood has been compared with buffalo horn for hardness.—W. T.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

EARLY-FLOWERING TULIP SPECIES.—S. E. B., Abergavenny: Two of the earliest of tulips to come into flower are Tulipa violacea and T. biflora. The former is usually rather the earlier of the two, and it has magenta-red flowers, with a faint suggestion of violet in the colouring. T. biflora is a Russian species, introduced over a hundred years ago; it has yellowish flowers, produced two or more on a scape.

PLANTING SWEET PEAS.—W. H. L., Lincoln: Keep the plants as hardy as possible in the cold frame, only covering them if very cold weather is imminent, and then not closing the frame. Plant them out at the earliest favourable opportunity. The season is late, and if the ground is very cold nothing will be gained by planting unless the plants are starving for want of food and root room. We saw several rows of fine plants set out on Good Friday, and on Easter Monday morning they experienced two sharp and heavy snowstorms. Keep the plants well supplied with water, and give weak liquid manure if root-bound, and plant out the first week in May.

HARDY EXOTIC FERNS.—O. S., Hartland: There are, as you surmise, a number of beautiful hardy ferns not natives of the British Isles, but which succeed admirably in our wild or semi-wild gardens. The chief of these are Osmunda cinnamomea, O. Claytoniana, O. spectabilis (or gracilis), Nephrodium Goldieanum, N. intermedium, N. marginale, Athyrium Michauxi, Aspidium acrostichoides, Cystopteris bulbifera, Woodsia obtusa, Onoclea sensibilis, Adiantum pedatum, Polypodium hexagonopterum, and Struthiopteris pennsylvanica. There are some others of rather doubtful hardiness, and it is hardly fair to cite Woodwardia radicans, Dicksonia antarctica, and Lomaria magellanica as hardy because they thrive out of doors in Falmouth and the Cornish Riviera.

PROPAGATING THE TREE LUPIN.—B. A., Oswestry: The tree lupin (Lupinus arboreus) is readily propagated from seeds, and as these ripen in most gardens seedlings are not difficult to obtain, many coming up around an old specimen. Another method is to take cuttings of side growths, with a heel of old wood attached, in summer, and insert them in sandy soil in a cold frame.

VIOLAS.—N. D., Huntingdon: The plants should have been lifted and divided in autumn, and then they would have been strong specimens by this time, ready to burst into flower during genial weather. Lift the old plants at once and pull them to pieces, then plant the divisions where they are to remain, placing them in some gritty soil, to which leaf-mould and old decayed manure has been added. Attend to watering, and, next month, give a surface mulching of decayed manure and leaf-mould.

DAPHNES.—A. H., Reigate: Daphne indica can be obtained from any of the nurserymen who make a speciality of greenhouse plants. The names of the firms and their addresses will be found in our advertising columns. The price per plant will depend entirely upon the size and strength of the plants, but should range from 3s. 6d. upwards.

TREATMENT OF NEWLY-PLANTED RHUBARB.—S. J. C., Chesterfield: Use the hoe freely over the plantation, and give a light dressing of superphosphate. Towards the end of May, if warm weather sets in, give the plot a mulch of rich manure, first watering the plants if this should be necessary. Remove flower spikes directly they appear, and on no account allow any leaf-stems to be pulled. The superphosphate will assist the plants very materially when they make their second growth, and we have found it very beneficial on old plantations also.

CHRISTMAS ROSES.—T. B., Hertford: Treat the plants liberally from now onward, giving them good soakings of liquid manure occasionally as the season advances, and a mulching of half-decayed manure if necessary. Lift, divide, and replant next August, and give a light shading for a while afterwards. Pot up a few plants at the same time, as these will be useful for the conservatory during winter.

MARKET CULTURE HANDBOOKS. — A. C., Liverpool: We recommend the following works: "Mushrooms, Cucumbers, Tomatoes, and Salads" (1s.); "Carnations, Picotees, and Pinks" (2s. 6d.); and "Chrysanthemums for Garden and Greenhouse" (2s. 6d.). So far as we are aware, there is no book dealing solely with chrysanthemums for market culture, but you will find the work recommended a useful one. All the foregoing books can be obtained from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C. The other subjects are not dealt with from a market point of view in any book we are acquainted with.

LATHRÆA CLANDESTINA.—M. E., Wisbech: This beautiful root parasite will not grow any and everywhere, and considerable difficulty is often experienced by those who wish to possess it in obtaining a colony. The seeds that follow the violet-purple crocus-like flowers should be sown freely in damp soil, overlying the roots of a strong tree. Kerner, in his "Natural History of Plants," writes: The seed of Lathræa germinates on damp earth. The young root of the seedling grows at first at the expense of the reserve material stored in the seed, penetrates vertically into the earth, and sends out lateral branches, which, like the main root, follow a serpentine course, and search in the loose, damp earth for a suitable nutrient substratum. If one of these meets with a living root belonging to an ash, poplar, hornbeam, hazel, or other angiospermous tree, it fastens on to it at once, and develops suckers at the point of contact.

BEGONIA SEMPERFLORENS GIGANTEA.—P. T. H., Birmingham: This begonia differs so widely from the true B. semperflorens varieties, that no doubt many, like yourself, have wondered whether it was not of hybrid origin. Writing from memory, we believe M. Lemoine was the raiser of B. semperflorens gigantea, and that it was the result of crossing B. semperflorens with B. Lynchiana. It is a fine plant for winter flowering, though it does not branch very freely. It is rather largely grown at Kew for conservatory decoration.

DAMAGE TO FUCHSIA TIPS.—G. T., St. John's Wood: There are no signs of thrips upon any of the specimens sent, but there are ample signs that the buds and tender tips of the growths have been bitten or otherwise damaged by some strong pests, such as earwigs, weevils, and the like. Set traps of dry moss in dirty pots among the plants, and also examine the plants at night by means of a bright light. We believe weevils have done the mischief. Stand the plants over a white cloth in late afternoon, and then at night suddenly flash a bright light upon them, and the weevils will drop on the cloth, where they can be seen and captured.

SINGLE DAHLIAS.—E. C. W., Harpenden: The recognised authorities regard Beauty's Eye, Columbine, Darkness, Eclipse, Kitty, Leslie Seale, Madonna, Mikado, Miss Morland, Miss Roberts, Princess of Wales, and Snowdrop, as the best dozen single dahlias for exhibition purposes. A fine dozen for garden purposes are: Beauty's Eye, Columbine, Demon, Formosa, Kitty, Leslie Seale, Mikado, Miss Roberts, Polly Eccles, Snowdrop, Stromboli, and Victoria. The new varieties distributed for the first time this season are Brilliant, Elmira, Glencoe, Iroquois, Sincoe, Peggy, Enid, Fabian, Sevenoaks White, and Mrs. J. Tait.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

J. J., Croydon.—Iris stylosa grandiflora—very fine.

E. J. B., Bedford.—1, Shortia galacifolia; 2, Epigæa repens; 3, Phillyrea Vilmoriniana.

M. B. R., Oxford.—1, Pteris semipinnata; 2, Davallia Mooreana; 3, Adiantum Birkenheadi.

S. E. J., Leek.—1, Forsythia suspensa; 2, Tulipa biflora; 3, Saxifraga apiculata; 4, S. scardica; 5, S. cæspitosa.

A. J. G., Burwash.—The specimens were very poor ones. We believe No. 1 to be Cestrum elegans, and No. 2 Oxalis rosea.

D. J., Cirencester.—1, Epidendrum cochleatum; 2, Cypripedium Lawrenceanum; 3, Narcissus Johnstoni Queen of Spain; 4, Pelargonium quercifolium.

S. A., Chelmsford. — 1, Odontoglossum nævium; 2, O. Rossi majus; 3, Pulmonaria officinalis; 4, Ribes sanguinea; 5, Prunus Pissardi.

A. S. G., Wrexham.—1, Muscari conicum; 2, Tulipa biflora; 3, Saxifraga Rhei; 4, S. cæspitosa; 5, Anemone Pulsatilla; 6, Primula marginata.

RATING CASE.

A case of considerable importance was heard at the Herts Quarter Sessions a few days ago. It was an appeal by Mr. G. Beckwith, of Hoddesdon, against the assessment of his nurseries by the Ware Assessment Committee. Mr. A. Macmorran, K.C., and Mr. Naldrett, instructed by Mr. C. G. Scott, of 35, New Broad Street, appeared for the appellant, and Mr. W. Ryde and Mr. E. N. Konstam, instructed by Mr. G. H. Girby, appeared for the respondents.

Mr. Macmorran said that in 1896 the values of the property were fixed at £240 gross and £180 rateable; in 1898, after some small additions to the property, the figures were raised to £252 and £189 respectively; in 1904 a new valuation was made, and the figures were then placed at £338 gross and £225 rateable. These figures were not appealed against, though considered too high, but in 1907 the Assessment Committee again raised the assessment, and this time to £740 gross and £370 rateable, and against these figures Mr. Beckwith appealed. There were 46 houses, 33 of them built of iron by the late Mr. Beckwith, and now out of date. Counsel argued that £740 a year rent, as suggested by the assessment, was a ridiculously high sum, and the highest value of the premises was £316 gross and £169 rateable.

Mr. J. B. Slade, F.S.I., of Messrs. Protheroe and Morris, Cheapside, said he had carefully valued the property, and estimated it at £4,881 4s., which worked out at an assessment of £316 16s. gross, and £169 8s. rateable. Mr. Edmund Rochford, Mr. Charles Kinnell, and Mr. A. L. Rogers (W. Duncan Tucker and Co.), also gave evidence in support of the appeal.

After hearing the case for the respondents, whose various witnesses assessed the property between £500 and £600, the Court found for the appellant, with costs, and the assessment figures were reduced to £350 gross and £234 rateable.

That by the better cultivation of plants and the pleasure by which gardens are kept in order their expense is doubly repaid. From Seedsmen. Samples and Large Illustrated Catalogue post free. C. E. WEST, Higham Hill, London, N.E.

NOTES OF OBSERVATION.

◆

Annual Climbers for Arches.—The many climbing annuals which may now be bought cheaply in seed packets do not receive half the attention they deserve at the garden beautifier's hands. Many an arch which is bare at the base would be greatly improved for its summer display by a flowering annual planted near it; many a pergola with half-clothed sides would be the better furnished. Such places are not ideal spots for raising annuals, but the latter can always be sown elsewhere, grown to a good size, and then transplanted with plenty of soil about their roots. Sweet peas, nasturtiums, canary creeper, variegated Japanese hops, and the beautiful Cobæa scandens are a few eminently suitable subjects.—E. J. K.

Strawberry, Kentish Favourite.—This variety has been spoken of as a likely rival to Royal Sovereign for forcing, but our experience of it does not bear out this contention. We have tried it side by side with Royal Sovereign, under the same conditions of temperature and treatment. I am, of course, writing of it as an early forcer to form the first batch of ripe strawberries; but it may be that for mid-season and late forcing it will be more satisfactory. Kentish Favourite is of very compact growth, inclined to produce several crowns, which, of course, can easily be reduced in number. My experience of these compact growing strawberries is that the flower scapes are not thrown up sufficiently high above the leaves to be altogether satisfactory for early forcing. Plants of Royal Sovereign reduced to one crown generally produce a good strong flower scape, carried well above the foliage, which is what is required in early forcing, as flowers so borne generally set well. Two other varieties that promise well as forcers are The Bedford, and Bedford Champion. As an early, or good all-round forcer, it will require a fine strawberry to displace Royal Sovereign.—T. H. Slade, Poltimore Gardens.

Compost for Seedlings.—The compost used by very many novices for pricking out seedlings in is so badly concocted that it soon resolves itself into a pasty, closely compacted mass, and one which is no stranger to the green vegetable covering which betokens stagnant moisture. The fault is largely one of sifting the compost too finely, but it is also due to the use of improper sand or too little of what is proper. The proper sand for mixing with such compost is almost as coarse as fine rice, and I always use one-third of this, one-third of leaf-mould sifted through a half-inch square meshed sieve, and one-third of loam shaken out of turves but not sifted. This gives splendid results, and the green on my seed pans is no more plentiful than the green in my eye.—E. J. K.

KELWAY and SON, Langport.

THE VERY BEST SEASON of the year for planting Kelway's brilliant, new, large-flowered GAILLARDIAS is the present. They will give a striking effect in beds and borders from July to September, and the fine vividly tinted flowers, borne in innumerable quantities on long stems, are grand, and most lasting for cutting for the house. Collection "B," 12s. per dozen. Collection "A," 45s. per 100. KELWAY and SON, Langport.

NOTES OF THE WEEK.

Green Leaves.

When we consider the infinite diversity which is displayed in the plant world in size, habit of growth, shape of foliage, and in short, in every character which goes to form the distinguishing mark of a genus, a species, or a variety, and when in addition we note the marvellous range of colour assumed by the flowers, it seems strange that green should be all but universally the tint of the foliage. Even indeed, where the foliage presents other tints, it is always found that green is present, and is only masked by the other colours exhibited. The reason of this, the botanist will tell us, is the vitally important one that it is really the green colouring matter, the so-called chlorophyll, which is capable of performing those functions which are essential to the plant's growth, and we have a familiar exemplification of this fact in the weak constitutions of plants variegated with white, and the inevitable perishing of pure white foliage unless associated with attached green growths. It not infrequently happens that variegated pelargoniums produce pure white suckers or offsets, which grow healthily enough until an attempt be made to isolate them by severance. So long as they are connected with the root system of the green parent they derive vigour from the adjacent green leaves through the roots, but directly they are deprived of this support they languish and perish. The seeds of variegated plants often yield pure white seedlings, but they do not progress beyond the seedling stage, and die so soon as they have exhausted the store of nourishment contained in the seed which the parental green leaves had supplied. Examined microscopically this chlorophyll is found to consist of innumerable tiny grains, which are generated within the cells which build up the leafy structures, and the green colour is visible owing to the transparency of the cell walls. In some subtle fashion, these grains, under the influence of light are able to absorb the carbonic acid gas which is drawn in through the leaf pores or stomata from the surrounding air, and this gas they break up, and combine the solid carbon which forms an ingredient with the salts which the roots collect and supply in solution in the form of sap. Sugar, starch, and many other substances consist mainly of carbon, in conjunction with other elements, their differences being often entirely due to difference in the proportions of precisely the same elements. These marvellous little green grains are able to build up an immense number of such diverse combinations, some being deadly poisons and others forming nutritious foods, while the solid carbon itself is largely used to form the woody structures which support the foliage, and even strengthen the foliar structure itself in the shape of veins and veinlets. All our edible vegetables and fruits are thus created by chlorophyll, and pursuing this line of thought we are brought face to face with the wonderful fact that were chlorophyll non-existent the whole world would be a lifeless desert. Man himself could not exist, for it would not be merely a question of the compulsory conversion of the vegetarian to a meat-eater, since meat is merely a secondary product of vegetable food. Thus when we view in the spring the budding verdure of the trees and shrubs and see the pastures vivid green and the nascent cornfields' deepening tint, we practically are looking at the production of a new supply of life, itself derived from the vitalising energy of the sun as the motive force, which the tiny and apparently insignificant grains of chlorophyll are alone capable of utilising in order to grant a fresh lease of life to all animate creation.

MR. H. G. ALEXANDER.

Mr. H. G. Alexander is well known in horticultural circles and particularly so among lovers of orchids, because he has for several years had charge of the splendid collection of these interesting and beautiful plants brought together by Major Holford, C.I.E., at Westonbirt, Tetbury, Gloucester. Mr. Alexander was born at Bath, and the first five years of his professional life were spent at a small general nursery on the outskirts of the city. From thence he went to the Royal Crescent, Bath, where the Rev. H. Handley had what was then regarded as a fine collection of orchids, and it was here that Mr. Alexander laid the foundation of that special knowledge which has enabled him to place the Westonbirt collection in first rank, if regarded only from a cultural point of view. Further experience was gained at Survey Hill, Llandudno, where the late Mr. Joseph Broom had a collection of orchids. Following a short stay here, Mr. Alexander spent three years in the orchid department at the late Captain G. W. Law Schofield's garden at New Hall Hey, Rawtenstall. Here he was in the midst of many orchid collections, and took advantage of his opportunities to extend his knowledge of plants and cultural requirements. From New Hall Hey, Mr. Alexander went as orchid foreman at Blenheim Palace, but here he stayed only a few months, as in May, 1899, he entered service with Major Holford, who was then beginning to reconstruct many of his glass-houses and make up a large collection of orchids. There are now twenty-one houses devoted to these plants, and Mr. Alexander has entire charge of the department. Seven years ago, encouraged by Major Holford, he commenced to raise seedling orchids, and how well he has succeeded the records of the Royal Horticultural Society amply prove. The enterprise and enthusiasm of Major Holford and the skill of Mr. Alexander are further shown by the fact that Westonbirt exhibits of orchids have gained no fewer than ten of the Royal Horticultural Society's gold medals, besides minor awards. The magnificent Veitchian Cup was also won at the Temple Show in 1907 with the first exhibit Mr. Alexander had ever staged at that exhibition. Mr. Alexander has received five Lindley medals for special culture and twenty-three cultural commendations; these are abundant proof of his high cultural ability, while as evidence of his artistic skill in grouping the plants he grows so well, the Council of the Royal Horticultural Society recently presented him with a handsome Queen Anne silver teapot, suitably inscribed. Much more might be written about Major Holford's able grower, but for the present we will only add that he arranged a 300 sq. ft. group of orchids at the great Ghent show during the past week, and covered himself with glory therewith, and added materially to the already high prestige of Major Holford's superb collection.

Gardens Round about Bristol.—Bristol has long been famous as a centre of horticultural activities, and our readers are aware that many beautiful gardens are to be found in and around the city. In our issues of May 16 and 23 we shall describe and illustrate several of these gardens, including those of Barrow Court, Ashton Court, Cote House, Old Sneyd Park, The Priory, and Downside.

The Wintry Weather experienced over the greater part of the United Kingdom at the end of last week was of a quite exceptional character, and can hardly have failed in many districts to have seriously affected tender vegetation. In the more southern districts where the plum trees were in full bloom, and gooseberries and currants in process of development, much damage must have been done to these fruits. In some gardens in the South of England and within a short distance of the Metropolis, the frosts were so destructive that the crops of currants and gooseberries are described by our correspondents as having been completely destroyed. It is a point of some interest that the frost was nearly as severe, and the snowfall nearly as heavy in the South and West of England and Wales as in the northern counties of England and in Scotland. From several districts in Kent and Surrey we have received records of temperatures ranging from 20 to 22 degrees (12 to 10 degrees of frost), and at Cardiff 12 degrees of frost were registered. The temperature throughout the week ending April 25 was very low, and on Friday the highest reading was 17 degrees below the normal.

Railway Rates for Fruits.—In the discussion on the question of preferential railway rates before the East Kent Chamber of Agriculture, attention was directed to the need of a reclassification of the rates for the carriage of fruit, the case of plums being mentioned as one in which the charges are much in excess of more valuable produce, the handling of which is attended with greater difficulty. It was decided to ask for the enactment of a regulation that the rates given for foreign produce should also be made available for English produce where a consignment of not less than one truck load is offered. It was stated that a vessel returned from the Azores with a cargo of 7,000 cases of pineapples, the endeavour was made, unsuccessfully, to obtain satisfactory rates to London from Plymouth and Dartmouth, and the importer was about to arrange for transit from Newhaven, when it was suggested to him that Dieppe would be better. The result was that the vessel was sent to Dieppe for unloading, and the railway company conveyed the 7,000 cases across the Channel and thence to London at a cheaper rate than they were prepared to do so from Newhaven.

Proposed Addition to Ruskin Park.—Adjoining the newly-made Ruskin Park on Denmark Hill there is a pleasant strip of land, twelve acres in extent, and it is believed to be the nearest piece of unoccupied ground to the heart of London, and is readily accessible from the crowded districts of South London. As this area would provide an excellent playing field for grown lads and young men, strenuous efforts are being made to obtain the necessary funds for its purchase, and thus secure its dedication to public use. The sum required for the purchase of the land is £24,000. The London County Council have promised half the sum, and £9,000 have been subscribed by other public bodies and by private donors, and a strong appeal is made for the remaining £5,000. The hon. secretary is Mr. Frank Trier, Uplands, Champion Hill, S.E.

Dendrobium fimbriatum oculatum.—A fine example of this handsome orchid has just flowered at Cowley House, Chertsey, where Mr. A. Sadler is gardener to Mrs. Tulk. Mr. Sadler kindly sent us a photograph, that unfortunately was not suitable for reproduction, showing a remarkably fine plant carrying numerous spikes of bloom, many of the latter being produced from the upper part of the 5ft. long pseudo-bulbs that are three and four years old.

Colonial Fruits occupy an important position in the home markets at the present time, for not only are they plentiful, but a large proportion of them are of high quality. From the Cape we are now receiving liberal supplies of melons and pears, the latter including Louise Bonne of Jersey and Doyenne du Comice of good quality. The Australasian colonies are sending plentiful supplies of apples, which range from 7s. 6d. per bushel box upwards. Cox's Orange Pippin from Tasmania are remarkably good, and many boxes have realised in Covent Garden from eighteen to twenty shillings a box. Supplies from Canada and Nova Scotia are abundant and comparatively cheap, and the imports of bananas have been so large as to admit of fruit of the highest class being retailed at a penny for two "fingers." The claret-coloured banana has been coming to market rather freely, and, notwithstanding the rich flavour of its fruits, is not popular because of its colour.

Hybrid Orchids.—With reference to the communications recently received by the R.H.S. Scientific Committee concerning the crossing of albino orchids, Mr. R. G. Thwaites, of Streatham Common, S.W., records his experience as follows: "The result of crossing Dendrobium Wiganianum album (in which the peduncle is only slightly coloured) with D. nobile virginale (which is white all through) has been, in every instance, a coloured flower of the ordinary D. nobile type; whilst D. nobile virginale self-fertilised has in every instance produced pure white flowers, appearing to prove that D. Wiganianum album is not a true albino. Again, when D. nobile virginale is crossed with D. aureum in every instance the same result is obtained as from crossing the ordinary D. nobile with D. aureum, namely, D. Ainsworthi, the flowers of which are full of colour."

Feeding Habits of British Birds.—At the annual meeting of the Association of Economic Biologists the desirability of a systematic inquiry into the feeding habits of British birds was discussed. Mr. C. Gordon Hewitt, who introduced the subject, said that all biologists who had given special attention to bird life must have been struck by the absence of precise information concerning actual feeding of birds. They had on record any number of observations of naturalists and foresters and others who had observed the feeding of birds in a general way. These were all well enough, but they were not purely and absolutely scientific. They wanted something definite, as had been done in the United States by the biological survey, which examined the stomachs and gizzards of birds at different times of the year and in different places. It was only by purely scientific investigation that they could arrive at the proper conclusions as to the feeding of birds. He moved a resolution as follows: "That, in the opinion of this association, it is desirable that a committee should be formed for the investigation of the feeding habits of British birds." This having been seconded was carried unanimously.

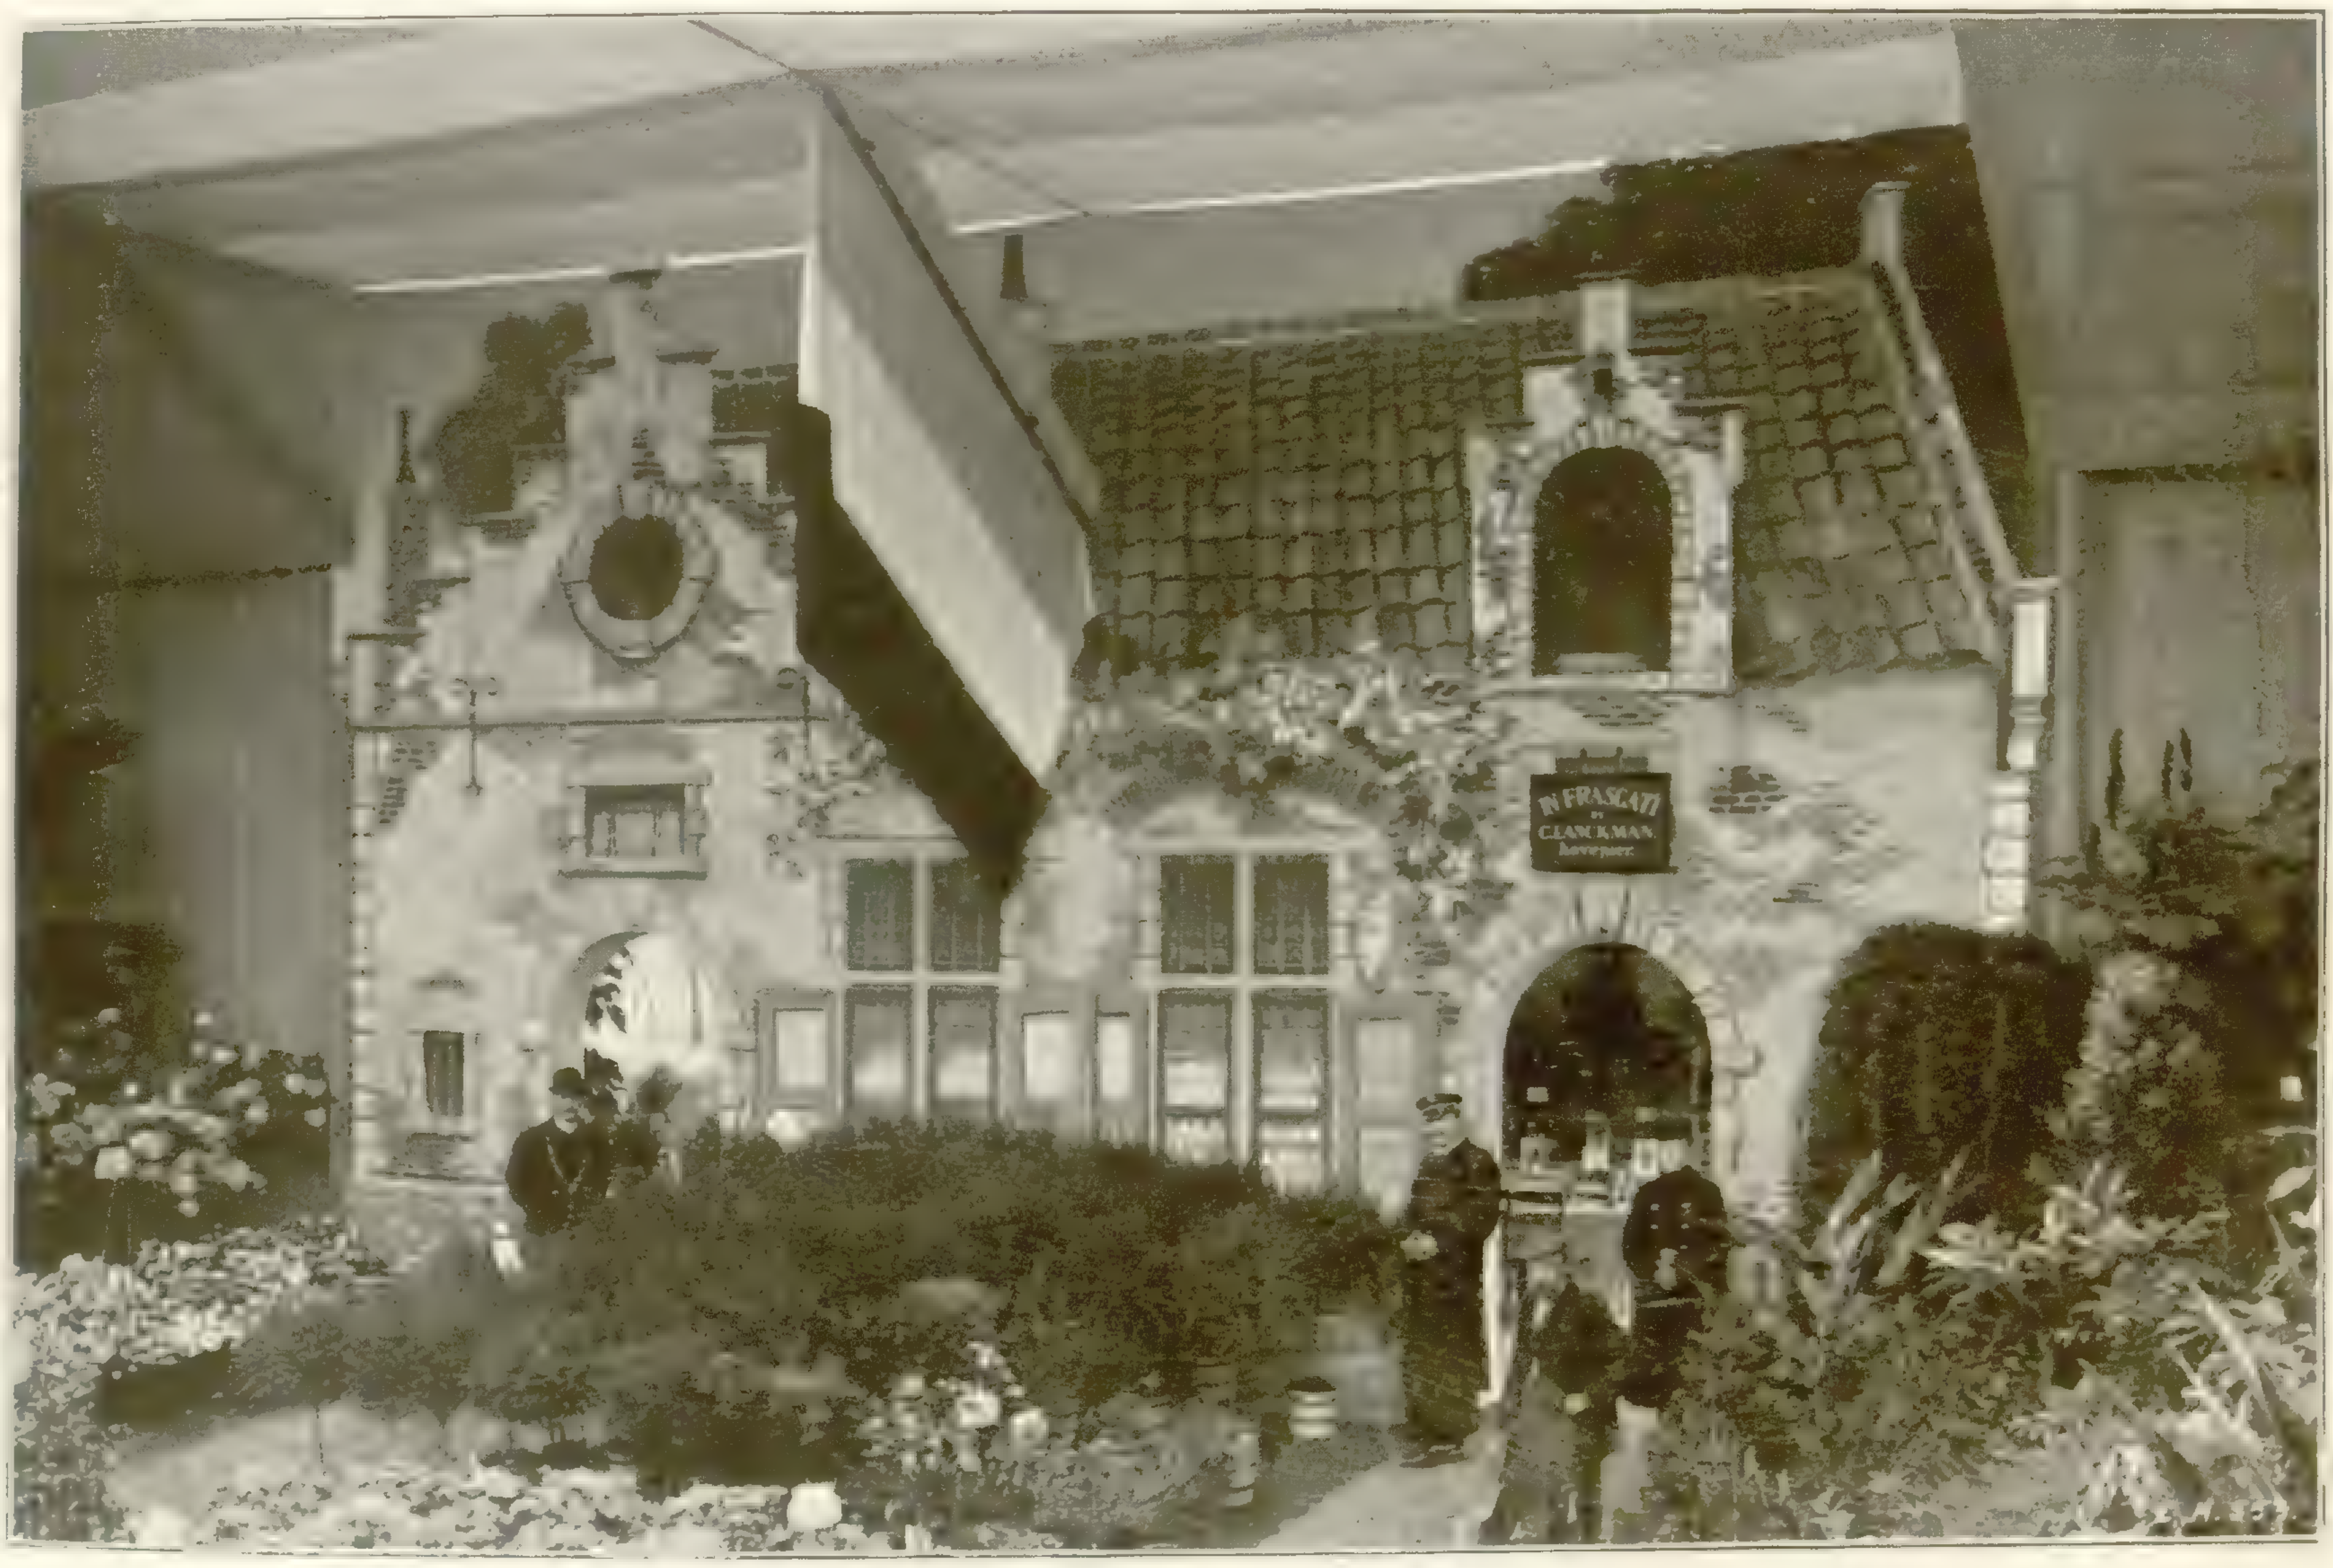
Nature Study for Women.—A course for helping women who are desirous of extending their knowledge of Nature study will be held at the Horticultural College, Swanley, from Saturday, August 1, to Saturday, August 15. Most of the instruction will be given out of doors, and under the guidance of experienced teachers there will be combined excursions for studying birds, pond life, insects, wild flowers, trees, grasses, etc., in their different evironments. Miss K. M. Hall will give the inaugural address on Saturday, August 1, at 8.30 p.m., the subject of which will be "Nature Study as a Preparation for Life." As far as possible the open-air studies will take place within easy distance of the college, but excursions will be arranged to districts with varying soils and climate, and the accompanying variety of natural objects.

Natal Tea.—Visitors to the recent exhibitions of Colonial Produce held at the Royal Horticultural Hall, Westminster, will have noticed numerous chests of tea grown in Natal. We now learn from the Imperial Institute authorities that this tea is intermediate in character between Indian and Chinese teas, and therefore likely to meet with a brisk demand.

St. George's Hills, Weybridge, one of the beauty spots of Surrey, and one that commands fine views, will in all probability soon be closed to the public, as Mr. W. F. Egerton finds that, notwithstanding the notices requesting visitors to keep to the paths and abstain from damaging the trees, shrubs, etc., considerable damage is done, and the notices are in many cases entirely disregarded. Many visitors to the Royal Horticultural Society's Gardens at Wisley, have, we feel sure, been to St. George's Hills, and they with many others will deeply regret that Mr. Egerton's generosity should have been imposed upon, and trust that he will not be compelled to close the grounds to the public.

THE GREAT CENTENARY FLOWER SHOW AT GHENT.

Replica of "In Frascati," where the First Ghent Flower Show was held in 1809.



[Photo: De Graeve, Ghent.

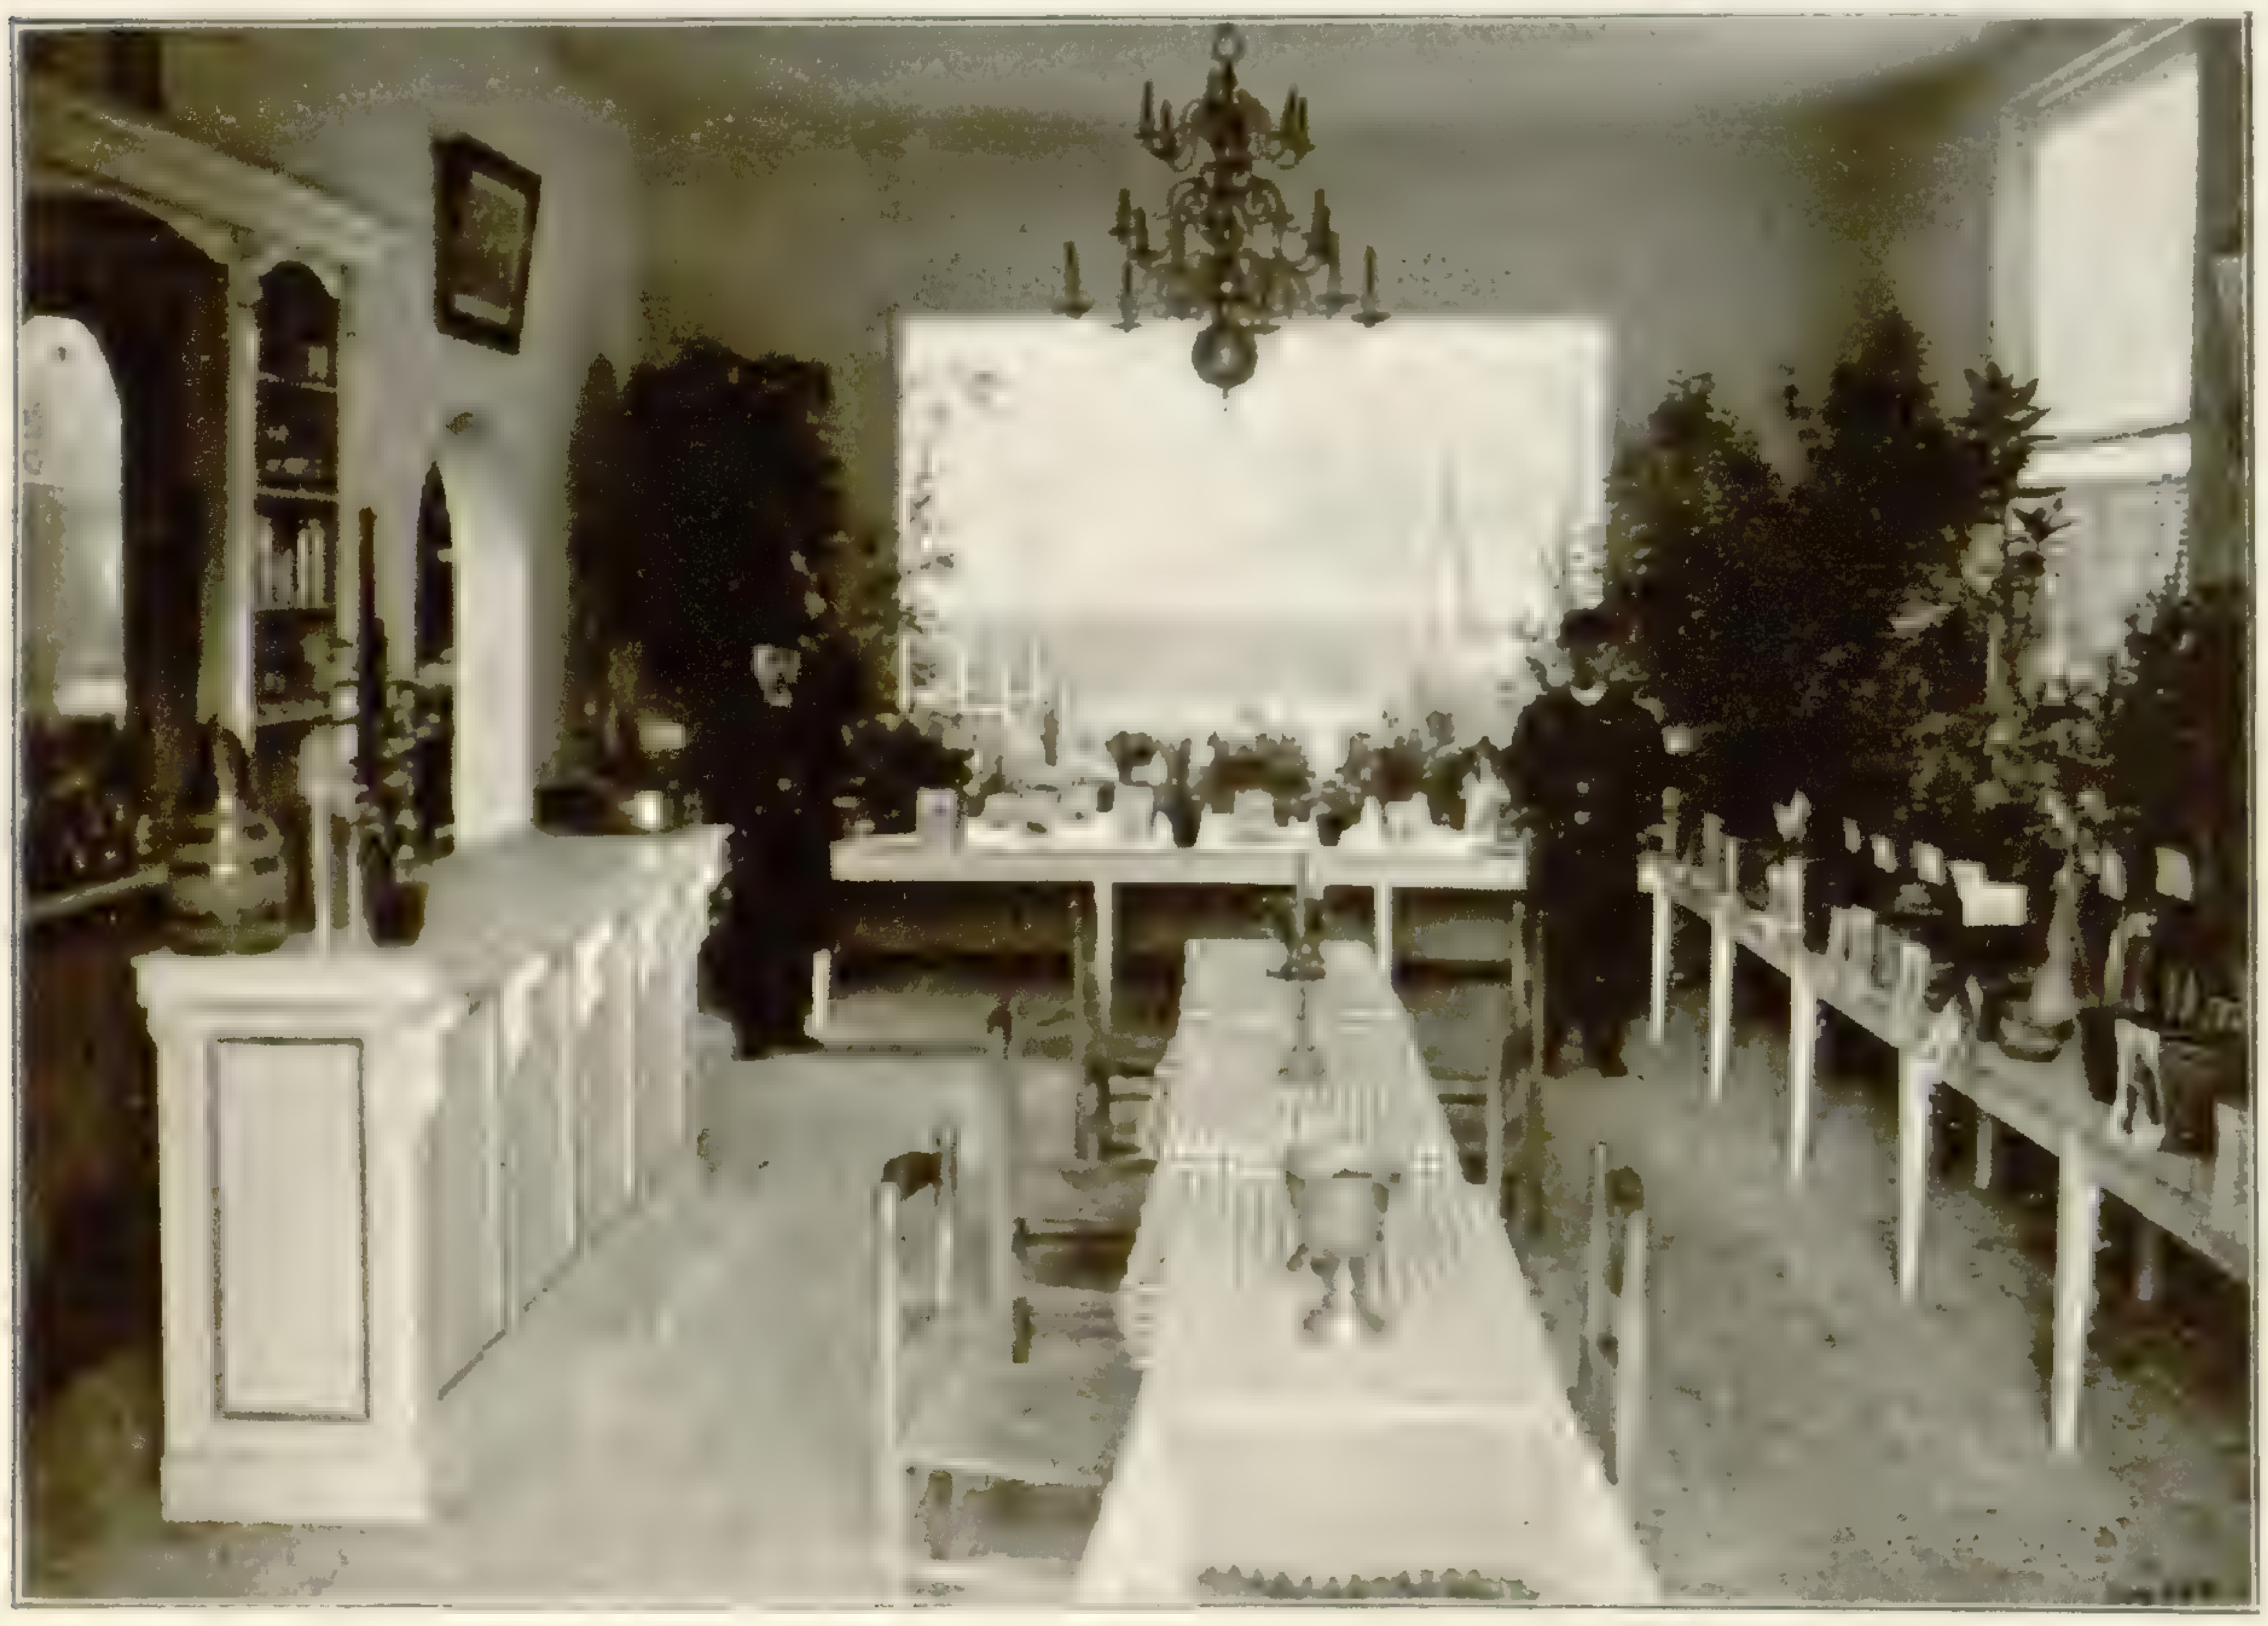
THE EXHIBITION with which the Société d'Agriculture et de Botanique de Gand has celebrated the hundredth anniversary of its foundation has, we are much gratified in stating, proved a splendid success, and been in every way worthy of so important an occasion. We have special satisfaction in placing this fact on record because of our knowledge of the great influence for good the society has so long exercised on European horticulture, and of the great and untiring efforts that have been made by the Council of Administration to ensure success. For several years past preparations have been in progress, and as the result, the council were able to prepare a schedule of a most comprehensive character, and to issue it to those interested more than twelve months since. They were also able to build well in advance an additional exhibition house in the grounds of the Casino, and thereby place themselves in a position to display to advantage the various plants contributed to the 700 classes. The Ghent quinquennials have long been famous for their magnitude, their distinctive character, and their immense attractiveness; but the centenary exhibition which we have now the pleasure of recording far surpassed in every respect the finest of the many magnificent flower shows that have been held in the ancient city of Ghent.

With the immense advances that have been made in all branches of horticulture, and the introduction of thousands of ornamental and useful plants during the past century, it is not surprising there should have been an immense difference between the first of the flower shows at Ghent and the one that has brought horticulturists from practically all parts of the civilised world to the city during the past week. Yet it was of much interest to take advantage of the opportunity the council had afforded visitors for instituting comparisons between them.

INCEPTION OF THE SOCIETY.

As stated in these pages a few weeks since, the foundation of the society was laid in a small inn on the left bank of the Coupure, and bearing the sign of "In Frascati." This inn was kept by a market gardener, and was frequented by the market growers who had their places of business in the neighbourhood, and also by the amateurs in the city and its vicinity. Here they discussed matters relating to fruits and flowers, and they appeared to be specially interested in the accounts that were given by those who had opportunities for visiting England of what was being done in the development of gardening in this country, which, at that time, was receiving new plants from all parts of the world. We are told that the return of a frequenter of the inn from a visit to England was anticipated with much interest, and that he usually had a good audience to listen to the account he had to give. The habitues of the inn would appear to have been especially interested in the recital of one Frans Von Cassel, who visited England early in the autumn of 1808. for at a gathering in October of that year they unanimously resolved to organise a flower show to be held early in the following year. The show was held on February 6, 1809, and proved most gratifying to the promoters, and the exhibitions were continued. It is of much interest that the records of the first exhibition are still available, and that we are able to ascertain from them the names of the plants that were exhibited. The "most rare and difficult to cultivate" of those shown were: Agave striata, Aletris capensis, Andromeda axilaris,

A. lucida, A. rosmarinifolia, Arbutus andrachne, A. unedo, Camellia japonica, C. japonica fl. rubro, Ceanothus discolor, Correa alba, Cineraria cruenta, Cyclamen coum, Cyclamen persicum, Daphne odora, D. purpurea, Dillenia scandens, Erica herbacea, E. triflora, Heliotropium peruvianum, Illicium floridanum, I. parviflorum, Jasminum glaucum, Jasmin de Valence, Justicia pulcherrima, Ledum angustifolium, L. latifolium, Lonicera tartarica, Magnolia ferruginea, M. grandiflora, M. nova species, Mimosa heterophylla, M. longifolia, Nerium oleander variegatum, Pancratium amboinese, Phylica ericoides, P. plumeda, P. spicata, Plumbago rosea, Portlandia rosea, Rhododendron ferrugineum, R. hirsutum, R. ponticum, Reseda arborescens, Rosa chinensis, R. Portlandica, Scilla maritima, Spielmannia africana, Viburnum lantana, and Citrus sinensis. The show was held in the principal room of the inn, which had at one end a large window that commanded a full view of the adjoining garden in which, during the summer months, the visitors sipped their beer, and other liquors. "In Frascati," with its large room and exhibition, has been exactly reproduced on the west side of the annexe or exhibition house. The façade of the inn forms the side of one of the bays, and on entering by the door one immediately passes into the exhibition room, with its bar, its long table at which the founders of the society sat and formulated their plans for displaying the products of their skill, and the stages, on which are placed representatives of the plants enumerated. The stages, it may be added, are arranged along one side and end of the room, and are of plain deal without covering. The length of the room is about thirty feet, and the width about fifteen feet. Anything more interesting to students of the history of gardening it would be difficult to conceive, and the council may be heartily congratulated on the success they have achieved in the reproduction of the inn and the exhibition that made it famous.



[Photo: De Graeve, Ghent.

LARGE ROOM OF "IN FRASCATI" WITH A REPLICA OF THE EXHIBITION HELD A HUNDRED YEARS AGO.

GENERAL SCHEME OF ARRANGEMENT.

The exhibition that is now being held at Ghent is arranged in the upper corridor which forms a series of halls that extend the whole length of the Casino buildings, the spacious winter garden contiguous thereto, in the fine exhibition house or annexe to which reference has already been made, and on the lawns. The corridor is devoted to orchids, floral decorations, new plants, bromeliads, and numerous plants of a miscellaneous character. In the winter garden are arranged tropical plants remarkable for the beauty of their foliage, and the various forms of Anthurium Andreanum and A. Scherzerianum. In the exhibition house are displayed the azaleas, hard and soft wooded greenhouse plants, hardy rhododendrons, araucarias, orange trees, forced shrubs, acacias, and New Holland plants. Our report will show that the corridor contained large numbers of orchids, and that two of the collections were of quite exceptional interest and value; that in the winter garden were large numbers of fine foliage plants that were remarkable for their splendid development; and that in the exhibition house was one of the finest displays of Indian azaleas the world has yet seen. We need not, therefore, do more than mention that in all the leading sections the Belgian growers have surpassed themselves, and that English exhibitors have fully maintained the traditions of this country, more especially noteworthy of the English contributions being Major Holford's collections of orchids and amaryllis, Messrs. R. P. Ker and Sons' amaryllis, and Messrs. H. Low and Sons' and Mr. Engleman's carnations.

NEW EXHIBITION HOUSE.

In the erection and furnishing of the exhibition house the council of the society have been especially successful, and English horticulturists were, without exception, filled with admiration of the taste and judgment displayed in the design of the building, and the beautiful effect produced in the arrangement of the plants therein. This building, which is of wood, has a roof in three spans, is several hundred yards in length, and has a width and height of admirable proportions. The roof, in three spans, is partly of glass and partly of wood, and the areas of glass and wood are so judiciously balanced that the building is well lighted without the light being so strong as to overpower, as it were, the varied hues of the flowers. To still further soften the light and heighten the general effect thin canvas, in broad alternate bands of white and pale green, is stretched lengthways under the roof on a level, or thereabouts, with the tops of the pillars that support the roof. The floor space of the central part of the building is, throughout the whole length, laid out as a vast flower garden, with the beds and borders on grass, intersected by walks, and these are filled with azaleas and other subjects. The beds and borders are arranged at different heights, and the turf has a gentle slope in various directions; but the walks are nearly level throughout. Under the side spans the ground is laid out in a more irregular manner, and the broad walks, with the more or less irregular sharply sloping banks and masses of rhododendrons and other flowering plants, and specimen palms, and tree ferns, present bold and beautiful features. At the far or north end of the building is an admirably painted canvas representing a beautiful park-like scene, and by a skilful arrangement of the foreground with rhododendrons and hydrangeas, the trees and the great breadth of grass blend as it were with the exhibition, and carry the eye far beyond its boundaries. Not less interesting and beautiful is the great painting representing Australian scenery, which forms a background to the groups of New Holland plants, which are well represented. In the association of the scene painter's art with that of the horticulturist, the council have been so especially successful as to merit our warmest congratulations, which we heartily accord them.

THE JURY.

The awards were made by a jury of nearly 250 members, with Lord Redesdale as the honorary president, and M. A. Viger as the president-general. The nations represented on the jury were Germany, America, Great Britain, Austria, Belgium, Belgium-Congo, Brazil, Denmark, Egypt, Spain, France, Holland, Grand Duchy of Luxembourg, Russia, Sweden, and Switzerland. The members of the jury mustered at the Casino at 8.30 a.m. on Friday for the purpose of being photographed, and at 9.30 a.m. they assembled in one of the halls in the Casino to receive the notification of the section in which they were to serve. Here they received a hearty welcome from M. Alexis Callier, the president of the society, who, in the course of a short address, spoke in feeling terms of the loss the society had sustained by the death of Comte de Kerchove since the quinquennial exhibition held in 1903. He also referred to the death of M. Fierens, the late secretary-general, and spoke of the important occasion on which they assembled, of the great work that is being done by the society in the advancement of horticulture, and of the pleasure it gave him in occupying the high position in which he had been placed. On the names being called, the following Britishers answered: Lord Redesdale, Major Holford, C.I.E., Lieut.-Colonel Prain, and Messrs. J. Backhouse, N. F. Barnes, T. Bevan, H. G. Cove, C. H. Curtis, H. Cutbush, De Barry Crawshay, J. Gurney Fowler, George Gordon, J. Guttridge, J. Heal, H. Ker, S. H. Low, W. H. Massie, J. Meekin, F. W. Moore, J. S. Moss, J. O'Brien, George Paul, C. E. Pearson, R. Hooper Pearson, H. T. Pitt, J. Robson, A. R. Rolte, F. Sander, Harry J. Veitch, W. Watson, J. Weathers, and Brian Wynne. After the thirty-two sections in which the jury was arranged had been formed, Mr. H. J. Veitch was elected president of the first section, Major Holford of the second, Mr. T. H. Pitt of the third, Mr. J. S. Moss of the fourth, Mr. G. Gordon of the fifth, Mr. J. Weathers of the seventeenth, and Mr. G. Paul of the twenty-third. The English secretaries elected were: Mr. J. O'Brien in the second section, Mr. S. H. Low in the fourth, and Mr. C. H. Curtis in the twentieth.

OPENING CEREMONY AND SOCIAL FUNCTIONS.

At 2 p.m. on Friday the members of the jury, with the council and officers of the society, had lunch in the Halle du Draps. There were about 300 guests. M. A. Callier presided, and was supported by Lord Redesdale, Major Holford, Mr. H. J. Veitch, M. A. Viger, and M. A. Ceuterick. The speakers were few, and included, in addition to the president, Lord Redesdale, M. A. Viger and M. A. Ceuterick. In the evening the members of the jury attended, by invitation, the festival performance by the Comedie Française at the Grand Theatre. The theatre was splendidly decorated with flowers, huge shields of natural foliage and flowers being arranged along the front of the four tiers of stalls and the gallery.

On Saturday, the 25th inst., the exhibition was opened by the King of the Belgians, who was accompanied by several members of the Royal Family. His Majesty was received by the President of the society, and on his arrival there were several speeches and numerous presentations. The King then made a tour of the exhibition, and was so greatly interested in the splendid display that had been produced that he did not leave until an hour and a-half after the time arranged. In the evening there was a reception by the City authorities at the Hotel de Ville, and this was attended by the greater number of the members of jury. The following day was rather a busy one for those who took part in the whole of the functions. In the forenoon the statue of Comte de Kerchove, which had been erected by subscription, was unveiled. This monument is erected in the Place du Comte de Flandres, and represents the late president of the society sitting and in a meditative mood. Standing on the steps on which the pedestal stands, are figures representative of horticulture. The ceremony of unveiling the monument was performed by the President of the society and the Burgomaster of Ghent, both of whom spoke in eloquent terms of the splendid work that had been accomplished by the late Count, and the great services he had rendered the society during the twenty years he occupied the position of president. The special flower market held in the Place d'Armes during the day was of an interesting and attractive character, but with a cold wind blowing one could have wished that the growers had had a covered market in which to sell their products. At one o'clock on the same day the members of the jury were entertained at raôut by the Horticole Syndicale, and as is customary on these occasions, were treated in a most hospitable manner.

MEMBERS OF THE JURY, GHENT CENTENARY FLOWER SHOW.

The social functions associated with the centenary celebration were brought to a close on the evening of the 26th with a banquet to the jury, and at this there was, as usual, a large gathering. M. Callier presided, and was supported by several members of the Belgian Government, the Burgomaster, and Lord Redesdale, Major Holford, M. A. Viger, and other notabilities. The dinner was, as usual, splendidly served, the music was excellent, and the speeches, if somewhat long, were of a decidedly high order of merit. Lord Redesdale replied on the part of the British visitors with a speech that was much appreciated. Following the banquet there was a procession of illuminated symbolical cars and tramcars, and on the procession reaching the Place d'Arms, there was a display of fireworks, which was witnessed by some 10,000 persons.

During the exhibition two parties from England visited Ghent and spent several days in the city. One of these was organised by Mr. C. E. Pearson, and the other by Mr. J. Brunton, whose party had previously spent several days in visiting the principal bulb growing districts of Holland. The railway station was tastefully decorated with fine foliage and flowering plants, and the tramcars were liberally festooned with flowers and foliage.

The arrangements were carried out in a manner deserving of the highest praise, and M. Ceuterick, the secretary-general, M. L. de Cock, the assistant secretary, and M. Duquesnoy, the treasurer, may be heartily congratulated on the manner in which they dealt with the multifarious details.

MAJOR HOLFORD'S ORCHIDS.

Of the orchids it is very difficult to know what to say. In the matter of colour effect and extent of display the azaleas beat the orchids, but in beauty and intrinsic value the orchids far surpassed all the other subjects. there were many wonderful exhibits, but it gives us great pleasure to state that for extreme beauty of arrangement, combined with high culture and splendid variety, the one set up by Mr. H. Alexander, orchid grower to Major Holford, Westonbirt, Tetbury, was by far the best. The group was a semi-circular one, arranged at the end of a broad corridor, with a deep bay behind. At the extreme back was a fine Dicksonia, and in front of this were grouped grandly grown plants of Odontoglossum crispum and Lælia flava, with a few plants of Dendrobium Wardianum at the base of them. Then magnificent plants of O. Harryano-crispum and O. Edwardi, their splendid spikes arching over a grand specimen of Cypripedium eburneo-Lowianum, the centrepiece of the group, that carried eighteen beautiful spikes. Around this were staged such lovely orchids as Cattleya Dusseldorfi var. Undine, almost pure white, and represented by about a dozen plants; Brasso-cattleya Digbyano-Mossiæ, strongly represented; Cattleya Luddemanniana alba; the superb Lælio-cattleya callistoglossa excelsa, L.-c. Baroness Schroder Westonbirt variety, and in front, the big Cattleya Mendeli Holford's variety, with exceptionally broad petals and an exquisite lip.

Towards the right-hand point numbers of such lovely odontoglossums as O. crispum, O. Wilckeanum, O. Rolfæ, O. cirrhosum, O. Pescatorei, O. loochristiense var. Lord Howick, and O. Andersonianum; and with these were Cymbidium Lowianum Pitt's var., with one fine spike of eighteen big, shapely flowers. In the left-hand side of the group Cattleya Mendeli Westonbirt var. was conspicuously good, with ten lovely flowers, the vivid purple apex to the lip contrasting finely with the blush sepals and petals; here also were Brasso-cattleya Digbyano-Mendeli, L.-c Zoroaster var. Rex, L.-c. Cæsar, a host of grand odontoglossums, miltonias, etc. Lælio-cattleya Golden Glory was another delightful plant, carrying half a dozen spikes of golden, ruby-tipped flowers.

In the foreground there were a few cypripediums, and these, with Sophronitis grandiflora, Oncidium concolor, and Odontoglossum Rossi majus, were used to provide a finish to the front margin of the display. There was no crowding whatever, and light-hued maidenhair ferns were used, with soft moss as a groundwork, with a few palms and asparagus along the back of the flowers. The artistic display exhibited in the disposition of this group was of as high an order as the cultural skill shown by the plants themselves, and the wonderful richness of Captain Holford's famous collection. It was something more, this grand orchid display; it was evidence that British pluck is not declining, for to take three pantechnicon van loads of valuable orchids over to Belgium and keep them for sixteen days out of their quarters is no small accomplishment.

M. CHARLES VUYLSTEKE'S NEW ODONTOGLOSSUMS.

There is not the slightest doubt that Mons. Chas. Vuylsteke, of Loochristy, Ghent, greatly surprised everyone, no matter of what nationality, with his wonderful exhibit of odontoglossums. Indeed, that is a mild way of putting it, because those who saw the great glass case filled with one hundred and sixteen of the most exquisite odontoglossums it is possible to conceive, all felt like the Queen of Sheba, that there were no words left in them. Who can adequately describe the variety of markings, the richness of the colouring, the variation of form, the strength and grace of the spikes, and the beauty of the collection? We confess we cannot; but, if M. Vuylsteke has done so much, it will surely be possible, before many years are past, to find equally lovely flowers in almost every collection of cool orchids, for there are hundreds of people now raising odontoglossums. The great bulk of the plants were of O. ardentissimum character, and among the most characteristic of them we may note O. a. Mdme. Vuylsteke, with very big flowers heavily blotched with very dark rich chocolate-red; O. a. vividum, very shapely and bright; O. a. Gladys, O. a. Princess Marie José, intensely marked with blood-red, purple tinted, on a white ground; O. a. Mercury, almost wholly rose and red-brown; and O. a. Imperatrice Augusta Victoria, very distinctly marked with very deep crimson-brown. Among the O. crispum varieties we were struck with O. Aida, with violet-rose shading around the red blotches; O. c. Lucine, deep red blotches and spots on a blush ground; O. c. venificum, and O. c. Adonis, almost wholly rich deep red-brown.

The four most striking plants included the O. ardentissimum Mdme. Vuylsteke already noted: O. egregium Mdme. Jules Hye de Crom, a rounded flower of a rich clear crimson-brown, almost a blood colour, tipped and very narrowly margined with bright rose, the lip bright scarlet with white tip—a magnificent orchid; O. eximium Judith, a big flower in which red, rose, violet, and white are beautifully combined; and O. maculatissimum, a wonderful plant with flowers that betray the O. maculatum parentage; the sepals are rich intense coffee-brown with a suffusion of crimson running through it, and the petals are of similar colour edged and tipped with brown-tinted white, lip rounded, bright brown centre, and whitish apex.

Other good things were O. Lawrenceanum triumphale, with yellow tips to the rich brown sepals and petals; O. concinnum Ixion, pale yellow, spotted bright brown; O. gandavense cœruleum, with curiously coloured violet-shaded flowers; and O. gandavense azureum of darker hue; O. rutitum, bright brown; and the glorious O. Vuylstekiæ Exquisitum, with very large intense purple-brown flowers edged with white. But we must conclude, not because we finish the group, but because words fail to convey the beauty of the blooms, and, indeed, almost begin to confuse. We must hope that M. Vuylsteke will bring as fine a show over to the Temple Show, as we understand he has thousands of seedlings newly coming into bloom.

OTHER CONTRIBUTIONS OF ORCHIDS.

The gold medal for the best dozen seedling odontoglossums was won by M. Graire, of Amiens, France, whose set of plants was very beautiful; there were O. crispum Orange Queen, with orange-brown blotches; O. c. Illustration, deep red blotches on a rosy ground; O. ardentissimum La Gloire, big chocolate spots on a white ground; O. a. Pres. Callier, red, violet tinted blotches on a white ground; O. a. Empereur des Indes, a grand flower, with deep ruby blotches, shaded around with violet, on a white ground; O. a. Cavoir, freely marked with deepest blood-red; and O. Devossiana, the sweetly scented hybrid between O. Edwardi and Cochlioda Noetzliana, with a tall branching spike of small, intense dark crimson, purple-tinted flowers—altogether a very beautiful set. The best single seedling odontoglossum was O. crispum coloratum, a vivid red-brown flower edged with blush, from M. F. Lambeau.

M. Maurice Verdonck, Gentbrugge, Ghent, who won the chief prize for a collection of Brazilian orchids, was strong with Oncidium varicosum, O sarcodes, O. concolor, Lælia purpurata, Arpophyllum giganteum, and a few masdevallias. For Guatemalan and Colombian orchids, M. Verdoncke was again first, annexing the gold medal with a display of Odontoglossum crispum, O. luteo-purpureum, O. triumphans, the old Ada aurantiaca, Miltonia vexillaria, Cattleya Mendeli, Lycaste Skinneri, Epidendrum radicans, and numerous bright masdevallias. M. Verdonck was again successful in the class for Indian orchids, and here his chief subjects were Dendrobium Devonianum, D. Wardianum, D. Pierardi, D. nobile, D. Primulinum, D. barbatulum, Cœlogyne cristata alba, Cymbidium Lowianum, the brilliant Renanthera Imschootianum, and such old friends as Cypripedium niveum, C. callosum, and C. Curtisi, the latter of which is, strictly speaking, Bornean.

A well-arranged collection of fifty orchids, from M. Charles Dietrich, Anderghem, won for him the work of art offered as first prize in the amateurs' class for this number. The various plants were well grown and set out thinly over firm green moss; a few of the leading subjects were: Phalænopsis Schilleriana, Miltonia Bleuana, Zygopetalum Perrenoudi, Cattleya Mendeli, Phaius Norman, the lovely Phalænopsis Rimestadiana, Brasso-cattleya Mrs. Leemann, yellowish, fringed hybrid of this section; Oncidium Marshallianum, Odontoglossum crispum Mrs. Peeters, the beautiful Lælio-cattleya Cholletiana, a L. anceps hybrid with a spike of nine soft purple flowers; and L.-c. Captain Percy Scott.

Messrs. Charlesworth and Co., Heaton, Bradford, sent over nine plants, and these were Odontioda Bradshawiæ, O. Keighleyensis, O. Vuylstekiæ var. Albion, very bright and shapely; O. ardentissimum Ebor, a grandly spotted variety; O. sceptrum aureum, with a long spike of yellow flowers; O. crispum Prince George of Wales, richly marked with red-brown; O. Armainvilliersensis Xanthotes, white and yellow marked on the lip; Vanda lamellata var., and Miltonia Bleuiana var.

A gold medal fell to the lot of M. F. de Bievre for a very fine example of Cattleya Lawrenceana var. Royale de Laeken; this carried seventeen spikes, and an aggregate of over eighty brilliant purple flowers. The gold medal for the best odontoglossum hybrid was won by M. Firmin Lambeau, Brussels, for O. ardentissimum Memoria Lambeauiæ, a shapely flower with blush margins around the deep blood-red colouring that practically monopolises the sepals and petals, save for the white bases to the segments; the lip is white with a red-brown base and golden crest.

The grand gold medal offered by his Majesty the King of the Belgians for the best amateur's collection of orchids, was won by M. Firmin Lambeau, Brussels, with a very fine exhibit, which we in no way depreciate when we say that it fell far short of Major Holford's collection, which was not in competition. M. F. Lambeau occupied a large central table in the upper corridor, and here he disposed good examples of Miltonia Bleuiana, M. B. lati-maculata, Phalænopsis Schilleriana, Phaius Norman var. atro rubens, Odontoglossum crispum Madouxeanum, O. exultans-excellens type, O. Lambeauianum The Perle, O. L. Deputé Begerem, very beautiful; O. L. Hellepulianum, freely spotted with rosy-red, white lip; O. heatonense, O. Crispum eminatum; Cattleya nivea, C. Mendeli superba, C. intermedia alba with twenty lovely white flowers; a large Cochlioda Noetzliana, and a good Mexillaria luteo alba, Cypripedium Rothschildeanum with eight flowers, etc., etc.

M. Emile Praet, Mont St. Amand, showed a group of Cattleya Schroderæ, fifty plants, but there was nothing striking or distinct among them. The best lot of masdevallias came from M. Joseph de Hemptinne, St. Denis, Westrem, who had M. Pourbaixi with about fifty flowers; M. Veitchiana grandiflora, very fine; M. Chimæra, and M. Ephippium. M. de Hemptinne led in the class for one masdevallia with a splendid example of M. Pourbaixi that must have carried over a hundred of its vivid orange-yellow flowers. There were two collections of cypripediums, but in neither of these was there anything of special merit, either culturally or otherwise; M. Maes-Braechman, Mont St. Amand, and M. Pynaert Van Geert, Ghent, were the exhibitors. To us, by far the best collection of Cypripediums was the one for which Messrs. Jansens and Putzeys, Merxem, Antwerp, gained a gold medal. Here, in a glass case, there were fine flowers of C. insigne Sanderæ, C. aureum Hermodes, C. Lawrebel, C. Mandiæ, C. aureum Ali-Baba—nearly white, quite a pale green; and C. Euryades var. Lækenense.

In the trade class for fifty orchids M. Emile Praet, Mont St. Amand, won the first prize, a work of art, with a good set, that included Cattleya Schroderæ Golden Blot—the lip being almost all deep yellow; C. Lawrenceanum, with eighteen flowers; Lælio-cattleya Kerchovei, L.-c. callistoglossa, L. anceps cross, Phaius Norman, Odontoglossum Lambeaueanum, Miltonia vexillaria, etc. The best lot of fifty plants of Odontoglossum crispum, the one that gained the gold medal, was exhibited by M. A. Muesser, Brussels, but there was nothing of special value or interest in the collection, though it served, in some measure, to show the great variation of this species.

Particularly good, and also somewhat unusual, was the splendid group of Cattleya Lawrenceanum, for which M. Theodore Pauwels, Meirelbeke, near Ghent, gained a gold medal; the plants were well grown and flowered. M. Pauwels gained another gold medal for thirty orchids, and here he showed large specimen plants of Miltonia Bleuana aurea, Cattleya Mendeli with over fifty flowers, C. Trianæ with a dozen blooms, C. Schroderæ Perfection with ten flowers, C. Lawrenceanum with thirty flowers, C. Skinneri with seven spikes, Lælio-cattleya Domniana, Cypripedium caudatum with three of its big long-tailed flowers, Angræcum sesquipedale, etc. M. Pauwels had also the finest vanda, a fine example of V. suavis pallida with twenty large greenish-white flowers.

Mons. A. A. Peeters, St. Gilles, Brussels, had a case of choice odontoglossums, not for competition. There were some rare beauties, including a glorious O. Lambeauianum, O. crispum Madouxianum, O. ardentissimum Evansianum—very fine, O. a. Cooksonianum, O. crispum Lindeni, and O. Fascinator Souvenir de Centenaire, the latter finely spotted with deep crimson-brown. Mons. G. Vincke-Dujardin, Scheepsdaele, near Bruge, contributed a large collection of cattleyas and lælio-cattleyas, and among the good things were Brasso-lælia Helen, B.-c. Madame Maron, Cattleya Vulcan, C. intermedia alba, and C. Schilleriana.

The finest specimen cymbidium was one of C. Lowianum, carrying from twenty-five to thirty spikes of bloom, and measuring about eight feet across. M. Verdonck had a bold group of dendrobiums, chiefly D. Wardianum, and in the corresponding trade class M. Vincke-Dujardin secured the premier position.

Something of the extent and importance of the orchid section of the exhibition will be gathered from the fact that no fewer than seventy-three classes were provided for them. The non-competitive displays were awarded high honours, and first position was given to Major Holford, to whom was presented a fine "Œuvre d'Art." A work of art to the value of 500 francs was awarded to Mons. Chas. Vuylsteke for his superb odontoglossums, another to Mons. A. A. Peeters for his few beautiful odontoglossums, and one to M. Chas. Mees, of Brussels, for his orchid decorations.

NEW PLANTS.

One large table in the upper corridor was reserved for the new plants exhibited by Messrs. Sander and Sons, St. Albans and Bruges, who secured the premier award, a gold medal, in the class for a dozen new plants of merit, not yet in commerce. These plants were Anthurium Sanderi, with large leaves of the A. crystallinum order, and measuring about a yard long by two feet wide; Bromelia tricolor, a freely spined species with long drooping leaves of bright green, margined with creamy-white, and with pinkish lines on the young leaves; Ptychoraphis bertiana, an elegant Kentia-like palm from the Straits Settlements; Pinanga Micholitzi, a bold and handsome species with leaves mottled in two shades of green in such a fashion as to suggest that marmorata would have been a good specific title; Croton Fred Sander, with three-lobed leaves, the base vivid yellow, and the tips of the lobes dark green; Nephrodium gracillimum, a bold and elegant species from New South Wales; Pereskia Godseffiana, an ornamental species with pale green leaves marked with green and rose, and coloured with bright rose-red on the under surface; Anthurium Laucheanum, from the United States of Colombia; this has bright green leaves with the surface puckered up into numberless andulations between the variously sized veins and ribs; Caladium Sanders' Seedling, a large-leaved, brilliant red and rosy-hued variety; Encephalartos Woodi, a spreading and handsome species from South Africa, and one in which the leaf divisions are tough, larger than in most species, and lightly spined along the margins, the colour is deep green; Cocus nucifera aurea, a yellow-stemmed and yellow-leaved variety of the cocoanut palm; and Philodendron Ilsemanni, a very prettily silvery-variegated species with quite small leaves for a philodendron. The most striking and probably the most useful are Ptychoraphis Sieberti, Pinanga Micholitzi, Croton Fred. Sander, and Pereskia Godseffiana.

[Photo: De Graeve, Ghent.

MAJOR HOLFORD'S MAGNIFICENT COLLECTION OF ORCHIDS, GHENT CENTENARY FLOWER SHOW.

Mons. L. M. de Vilmorin, Paris, was awarded a silver-gilt medal for six plants not yet in commerce; these were not very attractive, but their value will be better determined later; they were Clematis species, Corylus thibetica, Potentilla species, Rhododendron chartophyllum, Sorbaria assurgens, and Trollium species. The best hardy plant not previously shown before the society was Dividia involucrata, staged by M. Maurice de Vilmorin.

We refer to other new things under their various headings, but we cannot refrain from alluding here to the extraordinarily beautiful Cineraria Scarlet Hybrid exhibited by Messrs. Vilmorin, Andrieux, and Co., Quai de la Megisserie, Paris; this is of good florists' form, and has fine heads of blooms, but its great distinction lies in the fact that the flowers are wholly of a rich deep scarlet colour, a dazzling shade. We have so long been used to white, and blue, and purple, and dull crimson shades in cinerarias, that we have regarded a scarlet variety as something to be hoped for, but scarcely obtainable. The Messrs. Vilmorin and Co. have, so to speak, accomplished the impossible, and when they send out seeds of this brilliant variety in 1909 there is not the slightest doubt that the demand will be at least equal to the supply.

M. L. de Smet Duvivier, Mont St. Amand, set up an exhibit of plants not in commerce before 1903; this included Croton gandavense, Heliconia illustris, Nephrolepis Amerpohli, Acanthus montanus, Selaginella Watsoniana, etc. For a new fern, M. de Smet Duvivier scored with Nephrolepis Amerpohli. There was nothing specially attractive among new crotons, and Messrs. Anatole Cordonnier, and Fils' display of ten seedlings, though awarded a gold medal, contained all broad-leaved varieties, and Mons. Eugene Florin, yellow and green, was the best.

The new Hedera dentata variegata that gained an Award of Merit at Holland House in 1907 was finely shown by Mr. L. Russell, Richmond; this is very handsomely variegated. Myosotis Ruth Fischer and M. Liebesstern, both dwarf, large-flowered varieties, of light blue colour, and evidently useful for spring flowering, were shown by M. Julius Fischer, of Stuttgart. The beautiful Tulipa Fosteriana, which we first drew attention to in connection with the quinquennial bulb show at Haarlem three years ago, was well shown by M. C. G. Van Tubergen, Swavenberg, Haarlem, Holland. This is a fine scarlet, yellow-based species, from Bokhara, introduced in 1905.

HIPPEASTRUMS.

Facing the entrance to the upper corridor, from the Casino, Mr. A. Chapman, gardener to Major Holford, C.I.E., C.V.O., Westonbirt, Tetbury, Gloucester, arranged a large crescent-shaped group of gorgeous hippeastrums. This display, one of the finest in the whole show, consisted of about three hundred finely-grown plants, all grandly flowered, and carrying blooms of fine size, form, and colour. The colours were well disposed, the vivid crimsons and orange-scarlets being distributed among lighter varieties in which white grounds were prominent. Considering the number of plants displayed, the fine form maintained throughout the group was especially wonderful. This group also assisted materially to enhance the reputation of British horticulture, and our Continental friends greatly admired it. Among white, or nearly white varieties we must note Harvest Moon, Mildred, Milton, Mayflower, Lyra, Columbine, Diana, and Bridesmaid, the latter very clear and beautiful. Of very fine form and rich colour were Laus Veneris, Chimborazo, The Doge (very dark crimson), Lord Boringdon, Charon, Etna, and Tintagel. A few of the best with bright markings on a white or light ground were St. Hubert, soft red and cream; Apollo, light soft orange and white; Cassandra, rosy red and white; and Harlequin, very round, vivid scarlet veins and shading on a pure white ground. With a few palms for background, and a thick bed of loose green moss as a bed and covering for the pots to make a finish to the exhibit, this display stood out as one of the best.

This was a non-competitive display, but the judges very rightly awarded Major Holford a large gold medal for it.

There were six competitive classes for hippeastrums, and the leading one was for seventy-five plants. There were two competitors, and the work of art offered as the chief award was won by the English firm of Messrs. R. P. Ker and Sons, Aigburth, Liverpool, with a fine lot of plants that showed a great variety of colouring, including several rosy and silvery-rose varieties, and some white grounds, almost all of good form; one or two plants, however, rather spoiled the general effect because the flowers were small or not opened, but these were only small defects. From the Establishment Labelliflos, Voorschoten, Holland, came the second prize set, in which orange-scarlet varieties prevailed—the group was badly set up. MM. L. Van Houtte Pere, Ghent, received a gold medal for a set of twenty-five amaryllis that showed several pretty pink and rosy varieties; this medal was presented by Mr. R. Wilson Ker. The same firm gained a small gold medal for forty amaryllis, but they were beaten by Messrs.

Ker and Sons, who had a very fine lot of flowers in many shades of colour.

There were five classes for hippeastrums open to them, and in each of these the Messrs. Ker won the premier award. They were first for six new varieties with very beautiful seedlings, and first for six white-flowered varieties with a beautiful set, consisting of Snow Queen, Silver King, White Lady, Albescens, Silver Queen, and Purity, and they had the best newly-introduced hippeastrum, this being the lovely Snow Queen.

CARNATIONS.

A particularly fine lot of carnation blooms was well displayed by Mr. Engelmann, Saffron Walden, Essex; this display was very greatly admired, and it contained fine examples of Jessica, The Cardinal, My Maryland, Mrs. T. W. Lawson, Melody, Helen Goddard, White Enchantress, Flamingo, Dorothy Witney, and Queen Carola. The latter, a new and very fine deep clove-scented, deep crimson perpetual variety not yet sent out. Mr. Engelmann gained a work of art with his group, and a gold medal for his new seedling.

Messrs. Hugh Low and Co., Enfield, Middlesex, contributed a display of carnations, showing tall and short vases of very fine flowers of leading perpetual varieties, such as Enchantress, Britannia, Floriana, Mikado, Oriflamme—the yellow fancy, Aristocrat, White Perfection, Mrs. H. Burnett, and Harlowarden. They also showed growing plants to show style of growth, and put Lotus peliorhynchus between the vases and plants.

We may be pardoned a little national pride in the fact that the only exhibits of these now deservedly popular flowers came from England.

PALMS AND CYCADS.

Palms were grandly shown in the Casino, huge groups being set up in the corners and other places, where they broke up the general display in a very effective manner.

The Comtesse de Kerchove de Denterghem presented a work of art as the premier prize for five-and-twenty fine palms, and this was keenly competed for.

The Ghent Horticultural Society won the fine work of art, with the felicitations of the judges, with a wonderful display of big, towering examples, grandly and boldly grouped opposite the Casino steps. This was the largest, boldest, and most attractive exhibit in all the winter garden, and every plant was clean and healthy. The chief subjects were Wallichia oblongifolia, a big Sabal species, Thrinax Choco, Kentia australis, Thrinax Martiana, Calamus cinammomeus, Didymosferma porphyrocarpa, Caryota elegantissima, Astrocaryum Arayi, Phœnix Roebelini, Cyrtostachys renda—the red-stemmed palm, Latania aurea, Ceroxylon audicola, Ravenea Hildebrandti, Livistonia rotundifolia, Drymophloeus Zippŏli, and the handsome Licuala grandis.

MM. de Smet Freres, Ghent, won the gold medal offered as second prize with another grand collection, in which there were many specimens 15ft. to 20ft. high, of Cocos maximiliana, Kentia Forsteriana, Phœnix senegalensis, Coryota plumosa, Washingtonia robusta, Cocos Bonneti, and smaller examples of Kentia Belmoreana, Geonoma pumila, a beautiful Cocos Weddelliana, C. Jatai, and a handsome Rhapis flabelliformis.

M. Spae van der Muller, Ghent, led for fifteen palms, and he filled a big corner of the Casino with enormous plants of Latania borbonica, Kentia Forsteriana, K. Belmoreana, Coryota Walilchi, Cocos plumosus, and a beautiful Cocos Roebelini.

Cycads are usually a fine feature, and on this occasion the gold medal for six specimens fell to MM. de Smet Freres, Ledeberg, for fine spreading examples of Macrozamia (Encephalartos) horrida, M. villosa, M. Denissoni, Zamia Altensteini, Ceratozamia mexicana, and Zamia Vroomi. Close by these cycads M. K. Y. Kuyk, Mont St. Amand, showed a pyramidal plant of a variegated Hoya carnosa.

M. de Ghellinck de Walle brought up a famous set of twelve cycads, from Wondelghem, gaining a work of art as a premier prize. One wonders at the amount of glass that some of our Continental amateur friends must have to house these giants. Mr. Walle's plants of Encephalartos horrida, Zamia Vroomi, Z. Altensteini, Z. Macleayi, Z. mexicana, and Z. funiculata are enormous, finely grown, and perfectly clean.

FERNS.

There were several very fine collections of ferns, and in the trade class for thirty specimens M. Jules de Cock, Villa des Lauriers, Meirelbeke, won the work of art offered as first prize with a huge display of big examples of Dicksonia antarctica, Platycerium Hilli, Nephrolepis Knighti elegans, Asplenium nobilis, Nephrolepis Fosteri, Angiopteris evacta, Davallia fijiensis plumosa, Platycerium stemmaria, Angiopteris Laucheana, and the graceful Cyathea regalis. The second prize in this class fell to M. Edward Pynaert van Geert, Ghent, who had, among other things, beautiful plants of Asplenium biforma, nearly 5ft. across, Microlepia platyphila, Asplenium nidus avis, Polypodium aureum, Nephrolepis Fosteri, N. todeaoides, Cibotium princeps, and Blechnum brasiliensis.

In the amateur's class for thirty ferns M. Maurice Duquesnoy, Ghent, was awarded first prize, and he had a very fine collection for an amateur; his best examples were Acrostichum aureum, Nephrolepis todeaoides, N. davallioides elegantissima, Lomaria [illegible]loides, Didymochlæna lunulata, Lito[illegible] vespertina—very fine, and Lomaria [illegible]dovensis. M. Ghellinck de Walle's second prize set of ferns was another grand display and of a character we do not find in private gardens at home nowadays: Nephrolepis Piersoni, Microlepia strigosa, Pteris W

[Photo: De Graeve, Ghent.

VIEW IN THE NEW EXHIBITION HOUSE FROM THE SOUTH END, WITH AZALEAS IN FOREGROUND, GHENT CENTENARY FLOWER SHOW.

setti, Davallia speluncæ, and the cyatheas and dicksonias were the leading plants, but a pan of the charming little Lomaria L'Herminieri was greatly admired.

M. Draps Dom's collection of nephrolepis was very interesting, now that there are so many beautiful forms; he showed N. Scotti, N. elegantissima, N. Westoni, N. Scotti compacta, N. Whitmani, N. Barrowsi, N. davallioides grandiceps, and the lovely N. todeaoides.

M. Maurice de Ghellinck de Walle, Wondelghem, had the finest collection of selaginellas, showing big pans, perfectly grown, of S. apoda, S. Watsoniana, S. Mertensi compacta, S. cæsia, S. Kraussiana aurea, S. Emiliana, S. Krassiana variegata, S. Poulteri—very pretty, S. Vœgli, etc.—A fine collection.

STOVE PLANTS.

These were marvellously well shown, and with the palms and cycads they filled the huge winter garden with bold and coloured and elegant leafage, the whole making up a display that is probably unique in Europe.

Just under the balcony and steps leading from the Casino up into the Salle was grouped a marvellous display of specimen stove plants, some of them of enormous size, and most of them remarkable for the foliage rather than for their flowers. Imagine an enormous group of plants the whole length of the R.H.S. hall, and in the centre, extending halfway across the hall, and in height reaching to the top of the wall, and you have some idea of the extent of this wonderful display. The whole was arranged by the Ghent Horticultural Society and MM. Van Houtte Pere, Lim., and the greater part of it was the premier entry in the class for forty stove plants. We cannot detail the whole group, but would add that there were remarkably fine specimens of Nephrolepis davallioides furcans, Caladium Mrs. Laing, Nephthytis picturata, Bowenia spectabilis, Spathiphyllum picturatum—gold and green, Anthurium crystallinum, giant crotons, Pandanus Sanderiana, Heliconia illustris, Dracæana Sanderiana, Anthurium Veitchi, and A. Hookeri.

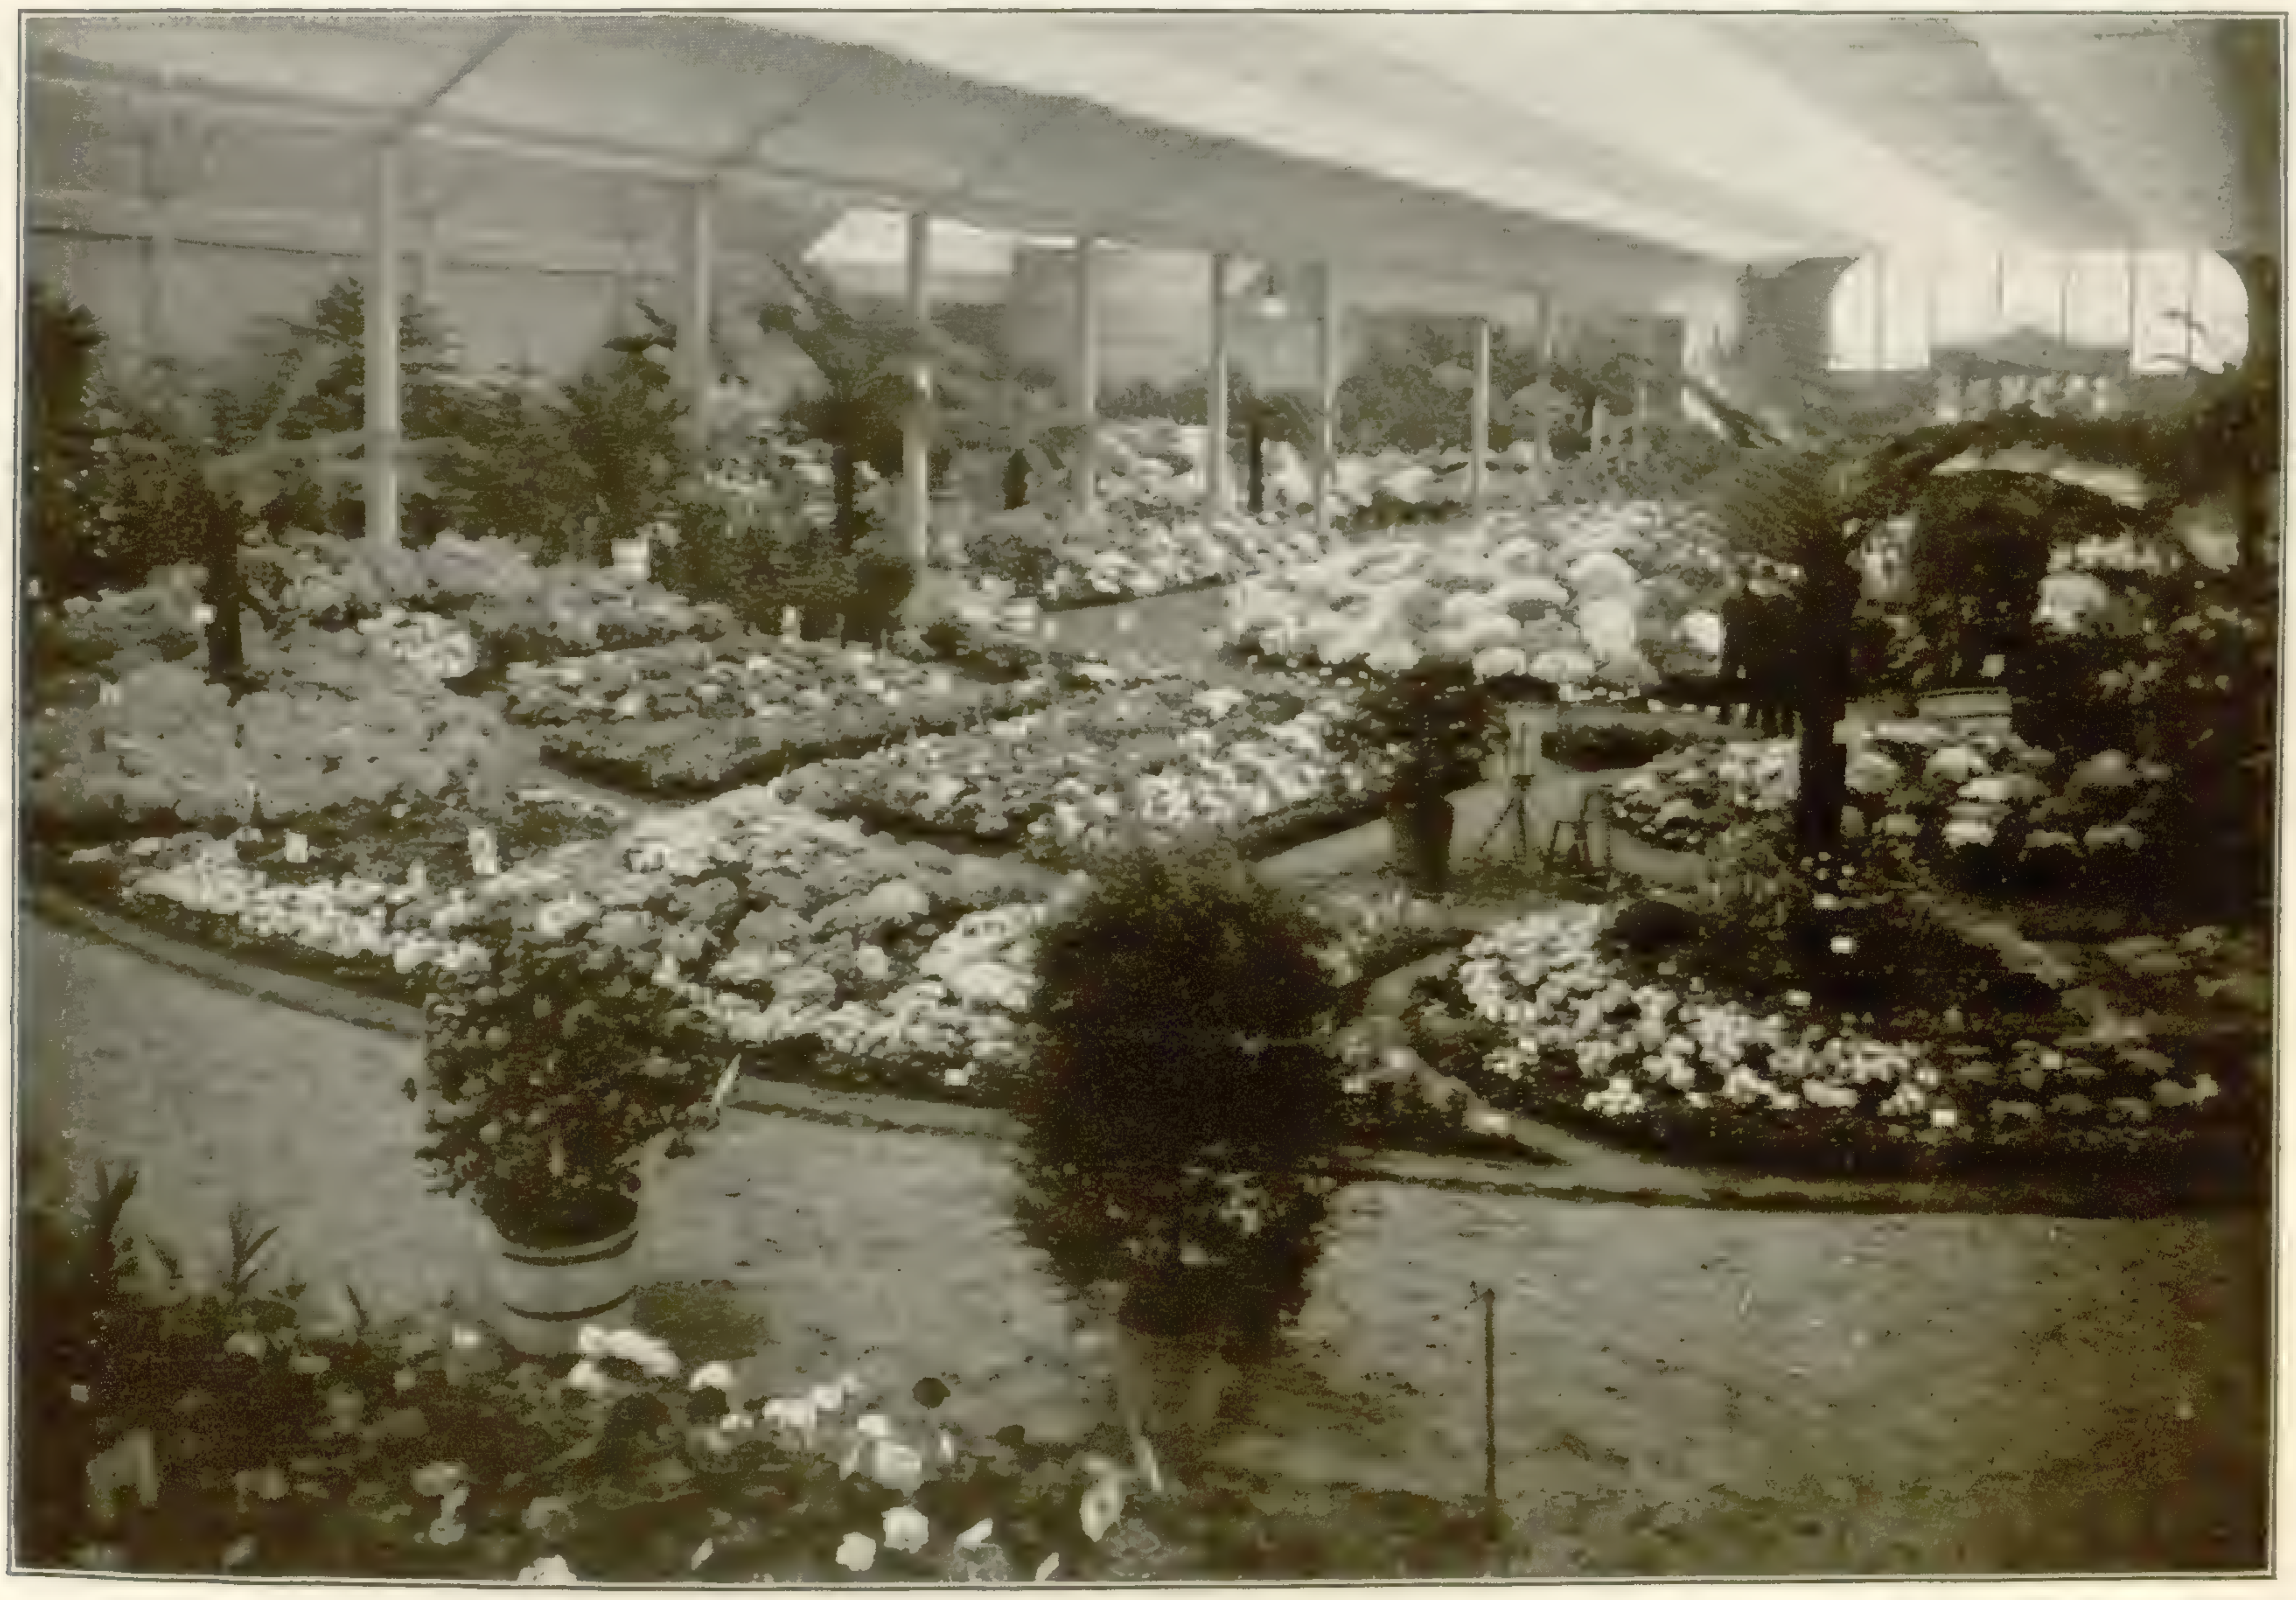
The second award fell to MM. Van Houtte Pere, Lim., for a smaller, but fine collection, in which we were struck with the cream and silvery Caladium Bahia, Dieffenbachia Jenmani, Nepenthes sanguinea, Dracæana Godseffiana, Adiantum Farleyense, a lovely Leea amabilis, and Licuala grandis.

A grand group of big specimen plants from the Ghent Horticultural Society, Chaussée de Courtrai, Ghent, won a work of art in the class for twenty flowering or non-flowering plants, the examples of Philodendron Sellowianum, Philodendron Mamei, Heliconia illustris, the beautiful and elegant Cocos Roebelini, Smilax argyrea, and the broad Alocasia Martin Cahuzac, were unusually fine, and the specimens of Nephrolepis davallioides furcans, 8ft. to 10ft. across was a wonder. In the second prize lot, from MM. Van Houtte Pere, Lim., Leea amabilis, a very fine Cœlogyne cristata alba, and the pretty Eugenia Glazioviana, very graceful, and with pale young green tips to the growths, were notable specimens.

The Ghent Horticultural Society (Société Horticole Gantoise) won the fine prize offered by M. Victor Hewsel de Meester for the best twenty-five striped or marbled stove foliage plants; this was a famous group, Heliconia illustris, Caladium Mrs. Laing, Croton Countess, Oaveltia borbonica, Dracæna Godseffiana, Spathaphyllum picturatum, the lovely red and cream Caladium Raymond Lemonnier, Maranta Sanderiana, and Pandanus Sanderiana, being the finest and brightest specimens. Some very fine plants were shown in this class by MM. Van Houtte Pere, Lim., who won second prize, their leading examples being of Heliconia illustris, Nephtytis picturata, Alpinia Sanderæ, the lovely Bertolonia Comte de Kerchove, Bougainvillea spectabilis aurea variegata, Leea amabilis—very beautiful, Asparagus Sprengeri variegata, and a huge broad-leaved green and gold Spathiphyllum picturatum.

In a smaller class for similar plants M. Alexis Dalliere, Ledeberg, led the way, and his most attractive plant was Vriesia splendens major.

The Ghent Horticultural Society had another magnificent display in the class for twenty fine foliage stove plants. A wonderful kentia surmounted the group that would have filled one end of the R.H.S. hall, and around and below it were grouped Anthurium Hookerianum, Cyanophyllum magnificum—grand foliage, Aralia souchifolia, Philodendron gloriosum, P. corsinianum, P. macrophyllum, Dieffenbachia magnifica, and Spathiphyllum picturatum, etc. The second prize in this class was won by MM. L. Van Houtte Pére, Lim., Ghent, with big specimens of Philodendron pertusum, Coccoloba pubescens, Dracæana indivisa variegata, Cyclanthus bipartitum, Araucaria compacta, Zamia verrucosa—very fine, Aralia souchifolia, a huge Alocasia Van Houttei, and several fine palms.



[Photo: De Graeve, Ghent.

LOOKING ACROSS THE NEW EXHIBITION HOUSE FROM NORTH END, WITH CINERARIAS, ETC., IN FOREGROUND, GHENT CENTENARY FLOWER SHOW.

MM. Duriez Freres, Wondelgem, Ghent, won the chief award for the best twelve stove plants with enormous examples of Corypha australis, Cibotium Scheidei, Areca lutescens, Rhapis flabelliformis, a beautiful Kentia Belmoreana, a perfect plant. There was nothing new or striking among the caladiums, though MM. Van Houtte Pére, Lim., had a very fair group of these handsome foliage plants, and won a premier award therewith.

Dracæana Massangeana, in a big group, was finely shown by M. J. E. Story, Ghent. M. Draps Dom, Laeken, showed new dracænas, of which Vulcan and Triomphe d'Horticulture were the most striking. MM. Penninch and Fils, Ghent, exhibited dracænas largely, and won several prizes; their bright red-hued Cantrelli, and such varieties as Marguerite Story, Milleti, De Smetiana, Souv. du Professeur Ed. Pynaert, and M. Jules Hye.

M. Delarnye-Cardon, Ledeberg, is a splendid cultivator of crotons, and he had a richly coloured set of plants that won several prizes, all in small tubs, and measuring about a yard through and 3ft. to 4ft. high; we may indicate a few of the most striking varieties; there were Marthe Cuhazac, Turnfordiensis, Isareus, Madame Duval, General Brissac, Madame de Smet Duvivier, Beauty, Mathilde Curt, Comte. Hugo, Maurice Bouvier, and Berthe Fournier.

[Photo: De Graeve, Ghent.

SPECIMEN FINE-FOLIAGE PLANTS IN WINTER GARDEN, GHENT CENTENARY FLOWER SHOW.

The Société Horticole Gantoise, Chaussee de Courtrai, Ghent, set up an enormous pyramid of huge crotons in the centre of the Salle-a-manger, in front of Major Holford's hippeastrums. It was a grand group, but something lighter would have been more in keeping with the situation. For this wonderful croton group the firm gained a big gold medal, with the felicitations of the judges. The finest specimens were C. Maurice Bouvier, Massangeana, M. Lucien Linden, M. Charon, Reidi, Thompsoni, Admiral Cuverville, Paul Garnot, Mdlle. Marie Van Houtte, Moorti, B. Comte, Jean de Smet, and Albert Truffaut. It will be seen from this list that the great majority were broad-leaved varieties, and when we say that some of the plants were 10ft. or 12ft. through, and the smallest probably not less than 5ft. across, some idea of this huge trophy of 25 plants can be obtained.

The bromeliads are always interesting, but one finds it difficult to grow enthusiastic over these stiff subjects, even when so finely staged as on this occasion. M. Firmin de Smet, Vinderhaute, had the finest collection of thirty plants, that included many varieties of hybrids from Vriesia Rex. M. L. Poelman, Mont St. Amand, had the finest single plant, but it was not named.

Among the stove foliage plants of great beauty mention must be made of the lovely bertolonias shown in a frame by MM. L. Van Houtte Peré, Ghent; there was an exquisite plant of B. Madame Bleu, like a piece of silver filigree over light green; one of B. Souv. de Gand, with brilliant purple-blue veins over a curious reddish ground; of B. Van Houttei, silvery-blue on soft red; and of B. Comte de Kerchove, dull silver on red-green. B. marmorata and B. Madame Leon Saye were also very beautiful; a silver-gilt medal was awarded this exhibit.

ANTHURIUMS.

These are very popular on the Continent. The best trade collection of anthuriums, Andreanum varieties, was staged by the Ghent Horticultural Society; the pink variety named Albert Ceuterick, and the white Centenaire, and another white, very large, named Edouard Pynaert, were the best. The Comte de Kerchove, Biervelde, had the best amateur's group of anthurium varieties, and he showed two fine Edouard Pynaert, the crimson Albert Truffaut, and the pink Le Progres.

The finest lot of anthuriums culturally was a remarkable group arranged by M. Arthur de Smet, Ledeberg, who had a score of large specimens, all grandly flowered, and making up a splendid mass of gay colouring. They were all Schertzerianum or Rothschildeanum varieties, and the red variety named Souvenir de Louis de Smet, with its big rounded spathes, was conspicuously good; Wardi and Perfectum superbum were other good forms. M. Arthur de Smet had another fine lot of anthuriums in the class for twenty-five plants, and here he had Wardi, Le Flambeau —deep crimson; Mdme. Dallieri bicolor, green and white; and Nigricans, very dark; these were all good varieties of the Schertzerianum group.

Anthuriums are always a great feature of the show, and the very slightest variation in shade and marking is considered sufficient to warrant a varietal name. Undoubtedly these anthuriums are very fine, and we scarcely make as much use of them at home as we should do. M. L. van Houtte Pére won a gold medal for a handsome group of twenty-five varieties of A. Schertzerianum, but M. Arthur de Smet, Ledeberg, secured the large gold medal for grand speckled varieties of the A. S. Rothschildeanum group, all bearing wonderfully fine rich-hued spathes.

AZALEAS.

Indian azaleas, which constitute so important a part of the Ghent cultures, were exhibited in immense numbers, and magnificent condition, and arranged in spacious beds and broad banks down the centre of the new exhibition house, they produced an effect which has certainly not been surpassed. The classes were numerous and the competition keen, and the various collections consisted of plants ranging from four to two feet in diameter, and remarkable for the splendid development in size and colour. There were two specimens about six feet in diameter, and although so freely flowered as to completely hide the foliage, they did not compare favourably with the more youthful examples. The first of the numerous classes for these attractive greenhouse shrubs was that for a group illustrative of the various forms of training that find favour, and arranged to produce a tasteful effect. The premier position was occupied by M. August Haerens, Somergem, Belgium, with a group remarkable for high culture and tasteful arrangement; the group included about two hundred and fifty splendidly flowered specimens, comprising the finest of the varieties in commerce, and so arranged as to produce a rich and harmonious effect. Especially noteworthy were Professor Wolters, a beautiful single variety with large, finely-formed flowers of a pleasing salmon colour with carmine blotch; Madame Vander Cruysen, a charming variety with semi-double flowers of a rich rose colour; Vervaeneana, an effective double variety, the colour delicate salmon-pink, with red blotch and spots on upper segments; Temperance, a distinct single form with mauve-coloured flower, a distinct shade among azaleas. Ernest Eeckhaut, very effective, the flowers double, and of a glowing rose-crimson hue; Anna Gundal, semi-double, pure white; Madame J. Vervaen, semi-double, the flowers very large, superb form, and a bright salmon-pink hue. The group consisted chiefly of round-head plants, ranging from one to four feet in diameter, with sufficient pyramids to remove any suggestion of flatness, and a considerable number of fan-trained plants. These latter are grown specially for the window and balcony, and are admirably adapted for placing on brackets in large rooms and in corridors. They were well-bloomed on both sides, and were very effective. We were not surprised to learn that fan-trained plants are becoming very popular in Belgium and France, and anticipate they will find favour in this country when they become better known.

An excellent class was that for forty specimens, and the several collections that were exhibited produced a wonderful display of colour, and proved to demonstration that the art of specimen culture is not lost in Belgium. In this class the Société Anonyme Horticole A. d'Haene, 111, Chaussée de Brussels, Ghent, were awarded a work of art with a magnificent collection. The specimens trained in the usual hemispherical form were quite solid with bloom, and the flowers were, in size and colour, far above the average that obtains in the case of such large examples. Conspicuous among others were Appolo, brilliant scarlet, semi-double; Vervaeneana, Roi d'Hollande, orange-scarlet; Madame Glover, single, pure white; Giant, double rose; Grandis, single, orange-red, very fine. Messrs. Sander and Sons, Bruges, were a close second with plants one or two sizes smaller than were those in the first-prize group, but they were densely bloomed, and the flowers were of the largest size, and superbly coloured. Mention may well be made of the following, for their great excellence, namely, Apollon, semi-double, white; Juillette, semi-double, carmine-red. Charmer, single, brilliant rose; Alba magnifica, a large, finely-formed single flower, but rather greenish in the centre, which detracts somewhat from its value; Baronne de V[illegible] single, pure white with frilled margins, one of the best of the whites; Simon Mar[illegible] bright rose, semi-double; Violacea multiflora, double, deep rich purple, valuable for its deep rich colour. In competition for the prizes in the class for twenty specimens, the Société Anonyme Horticole A. d'Haene, Chaussée de Brussels, Ghent, was first with splendidly flowered examples of medium size, and were awarded the object of art offered as the first prize; Messrs. Maenhout Brothers, Mont St. Amand, Ghent, were awarded the gold medal offered as the second prize.

One of the most noteworthy of the numerous classes for azaleas was that for a collection of fifty plants cultivated as [illegible] liers, and the premier award, consisting of a gold medal, was made, with the felicitations of the jury, to M. A. Haerens, who had finer examples of this style of training than those included in his group arranged for effect. The plants ranged from two to three feet across, and were finely flowered on both sides. These examples, by reason of their novelty, attracted much attention from those of the English visitors who are interested in greenhouse plants. The varieties were much the same as those represented in the round-headed plants of the usual type, and it would therefore appear that all the finest varieties are suitable for this style of training. MM. L. Van Houtte Pere, Ghent, were a good second with well developed plants, but with flowers on one side only.

There was a strong competition in the class for one hundred varieties, and in the result the gold medal offered as the first prize was awarded to the Société Anonyme Horticole A. d'Haene, Ghent, for a collection of quite exceptional merit. Chief among the many superb varieties represented were Mr. Hardy, semi-double, rich rose, Eugène Morel, bright salmon-scarlet, single; Sir John Llewelyn, double, pale pink, carmine centre, an old variety, but still one of the very best in its delightful shade of colour; Princess Victoria, double, bright pink, light pink at margin; Perle de Ledeburg, semi-double, pure white, flaked with scarlet; Ministre de Bruyne, double, brilliant orange-scarlet; Madame de Grivy, an exceptionally attractive single variety, the flowers light pink with brilliant carmine blotch; Unica, brilliant pink, semi-double, very beautiful; Edmond Vervaen, rich red-scarlet, double; Perle de Belgique, double, large, pure white, the flowers very fine for decorative purposes in a cut state; Memoire de Louis van Houtte, semi-double, large, rich rose; Jean Peeters, double, large, rich rose-red, one of the very finest in its colour; Camellia flore-pleno, double, rich orange, very distinct, the flowers large and the margin of the segments so smooth that they would have fully satisfied the requirements of the florists of the past generation; Purpurata, a distinct and beautiful single variety with flowers of a rose-mauve hue, reminding one of the best forms of Bougainvillea glabra. Gold medals were also awarded to the Société Anonyme Horticole, Mont St. Amand, and M. L. Van Houtte, Pere, who were second and third respectively with groups of finely-flowered plants.

Especially strong was the class for sixty plants with heads not exceeding twenty inches in diameter, and the work of art offered as the first prize was awarded to M. Auguste Vervaet, Meirelbeke, near Ghent, who exhibited plants as near perfection as we can hope to obtain in azaleas of the size required by the schedule. Every plant was practically solid with bloom, and so closely matched in size and finish as to suggest that they had been turned out of the same mould. Not the least point of merit was the size, substance, and colour of the flowers. Among other varieties that attracted our attention was Plutót, single, rich scarlet; Superba Leiheg, single, deep rich rose; Mammoth, single, the flowers large with elegantly undulating margin, and of a brilliant magenta-rose colour; Temperance, light mauve; Harlequin, double, bright, feathered with white at the margin, and splashed with purple; Baronne de Vriere, single, pure white, the flowers large with elegant frilled margin; R. Seidel, soft salmon, splashed and striped with vermilion; Souvenir de [illegible], semi-double, the flowers large and of a rich scarlet hue, one of the very finest in its colour. The gold medal offered as the second prize was awarded to Messrs. Sander and Sons for admirably-flowered plants, and the third prize, a small gold medal, was awarded to the Société Anonyme Horticole A. d'Haene. Pyramidal trained plants were of great excellence, and the class for twenty-five specimens was a remarkably strong one, and in the result Messrs. Sander and Sons won the work of art offered as the premier award. The plants were about three feet high, finely proportioned, and superbly flowered. M. Schepens-de-Baets, Saffelaere, followed closely, and was awarded a gold medal. In the class for 100 pyramids, M. Victor van de Weghe, Loochristy, was successful in obtaining premier honours, and the award of a gold medal was well merited. Of considerable excellence also were the fifty pyramids for which M. J. De Puysselyre was awarded a gold medal.

GREENHOUSE PLANTS.

Several large classes were provided for cool house plants, and as they were mostly well filled, and the specimens of large size and freely flowered, they constituted a feature of much interest. In the great class for twenty-five plants in bloom M. Firmin de Smet was awarded the work of art with acclamation, and no honour could well have been better deserved. The collection comprised large and superbly developed specimens of acacias, rhododendrons, azaleas, cytisus, bougainvilleas, and camellias. One of the most perfect of the specimens was an example of Genethyllis tulipifera, at least six feet in diameter, and bearing myriads of its attractively coloured flowers.

The bay of the exhibition house, with its admirable scene depicted on canvas of Australian scenery and characteristic vegetation, was a source of attraction to the general visitors, and of much interest to horticulturists by reason of the magnificent collections of acacias located therein. Especially noteworthy was the collection of these plants for which M. Fermin de Smet was awarded the gold medal, with the felicitations of the jury. This consisted wholly of specimens of immense proportions, and superbly flowered. A. verticillata was represented by a specimen at least twelve feet high and five feet in diameter, and loaded with flowers from the apex to the level of the tub in which it was growing. Equally noteworthy was a specimen of A. longifolia, although not so high by five feet. A. linearis, remarkable for its rich golden flowers, and A. parodoxa were also very fine. The same exhibitor also contributed a specimen of A. longifolia at least ten feet in diameter, and as much in height, and densely flowered.

[Photo: De Graeve, Ghent.

FACADE OF NEW EXHIBITION HOUSE, WITH AVENUE OF BAYS AND CORDYLINES, GHENT CENTENARY FLOWER SHOW.

Two fine collections of New Holland plants flanked the panorama of Australian scenery, and in both there were magnificent acacias. The foreground, arranged to represent a dry river bed, was formed with the medium-sized examples of eriostemons, correas, and other plants native of New South Wales. Of great excellence also was the collection of fifty specimens, for which Mr. Hearsell was awarded a work of art. Especially noteworthy were the examples of Sparmannia africana and Jacobinia magnifica. In addition there were numerous collections in the exhibition hall that were somewhat smaller, but of much merit.

Camellias are so seldom seen at exhibitions nowadays that it was of much interest to find two or three collections of large, admirably flowered specimens. M. E. de Cock contributed an exceptionally fine specimen of Erica conodes upwards of six feet high, finely proportioned, and literally smothered with flowers. The lovely Boronia heterophylla was well shown by several exhibitors, the plants about two feet in diameter, and profusely flowered.

In Messrs. Vilmorin Andrieux, and Co.'s large exhibit the strain of Primula japonica was notable for its compactness and its wide range of colouring; some of the fringed varieties were also very good. The cinerarias from this Parisian firm were the great attraction; we have already alluded to the wonderful Scarlet Hybrid, with big heads of good-sized, rich scarlet flowers—a most beautiful and distinct advance, and we now add that the firm has a pure white strain in Boule de Niege, a deep rose-coloured strain, and also a striped strain, as well as good selections of florists and stellate varieties as we know them at home. The Vilmorin calceolarias, polyanthuses, auriculas, and double cinerarias were other brilliant attractions.

Just in front of the beautiful valley scene in the Casino Mr. Chas. Mees, Rue Royale, Brussels, exhibited a magnificent lot of hydrangeas. The plants were unusually dwarf and covered with big heads of pink, rose, or bluish flowers. Mr. Mees' exhibits in several classes were all grouped together and formed a low extension to a great bank of rhododendrons, and adding greatly to the effectiveness of the whole scene. The plants were very fine indeed, showing that Mr. Mees is a past master in hydrangea culture.

M. F. de Laet, Contich, had two greenhouses filled with interesting succulents; he had a quantity of miniature plants, a batch of grafted mamillarias, some fine specimens of Echinocactus Grussoni, Cereus giganteus, and a batch of the scarlet-flowered Epiphyllum Gaertneri. An exhibit of chrysanthemum Mdme. Gustave Henry, composed of several dozen plants on single stems, in 48-sized pots, attracted a great deal of attention as the flowers were good, and so totally out of season, and they showed up well over a bed of maidenhair ferns.

Dracæna Bruanti var. Souv. de Francois Buysse, shown largely by M. Emile Vergauteren, Melle, is a very handsomely variegated and elegant plant, and one that ought to make a capital table and market plant for British cultivation. A splendid lot of a very large-flowered strain of Primula obconica, one of the finest strains we have seen, was placed in one of the greenhouses by Messrs. L. de Bock fils, Ghent. Such a lot would surprise some of our London friends.

A wonderfully fine set of fifteen araucarias won a gold medal for M. J. P. Hartmann, Ghent. The plants were beautifully furnished, and included Araucaria Bidwilli, and such varieties of A. excelsa as Napoleon Bonaparte, with very large spreading branches; A. Leopold II., soft grey green, very spreading; and A. e. glauca, as well as A. Rulei and A. R. glauca.

In early roses, in clivias, cyclamen, and in zonal pelargoniums we found nothing of special interest; the plants were well grown, but so far as we could see there were no new varieties; indeed, the pelargoniums were chiefly of English origin.

TULIPS.

The gold medal for a collection of five hundred Darwin tulips was awarded to Messrs. E. H. Krelage and Son, Haarlem, Holland, who had a very fine display, each variety being represented by a pan of ten bulbs, Wm. Pitt, Mr. Farncombe Saunders, Psyche, Mdme. Krelage, Oliphant, Faust, Mr. Jas. Douglas, Enterpe, Harry Veitch, La Tulipe Noir, and Sophrosyne were among the finest varieties. The Messrs. Krelage had the tulip section all to themselves, and secured a further gold medal for 250 Darwin tulips, showing varieties similar to those already mentioned. They also gained a gold medal for a collection of 250 Rembrandt tulips, which attracted considerable attention, by reason of their curiously-striped flowers.

FLORAL DECORATIONS.

M. Lachaume, the celebrated Parisian florist, arranged a pretty table with orchids and roses, and had a grand hall group of cut orchids, the receptacle being filled with phalænopsis, odontoglossums, and oncidiums. The vase of big carnations and one of liliums were fine, but the side table design of clematises did not seem quite harmonious. The firm gained ever so many gold medals. M. A. Dangotte, Ghent, kept himself to very dainty arrangements of light odontoglossums, phalænopsis, and Cattleya Mendeli; his brackets and mantel decorations were his best designs. There were a few other displays, but these were the best according to our own taste.

HARDY FLOWERING SHRUBS.

Very effective was the glorious display of mollis and Ghent azaleas, and the rich shades of yellow, rose, and orange which their flowers afford presented a striking contrast to the colours of the rhododendrons and other shrubs with which they were associated. One of the leading exhibitors of these was MM. Koster and Fils, Boskoop, Holland. The exquisitely beautiful Pink Pearl rhododendron was shown by several exhibitors, and its large trusses of beautiful pink flowers attracted much attention.

Hardy rhododendrons were arranged in large masses alongside the side walks, and produced an attractive display of colour. In some cases the groups were relieved by a few large palms, which, it is hardly necessary to say, materially enhanced the general effect.

A very beautiful display of lilacs was made in the new exhibition house by M. F. Stepman de Messemaeker, Rue des Quatre, Vents, Brussels. This exhibit was remarkable for its fine culture and also for the great variety of colours shown. The variety Lucie Baltet comes as near to a yellow as we have yet seen á lilac; it is deep cream colour; the large dark-flowered Leopold II. was grand, and Marie Micheli, double blush, Souv. de Leon Spathe, Marie Legraye, and the fine white Florent Stepman, were the most notable of a very interesting, beautiful, and fragrant set. M. P. de Vries, Aalsmeer, Holland, had a beautiful lot of lilacs, but we noted nothing new among the varieties.

EXHIBITS OUT OF DOORS.

Out of doors, between the Casino and the new exhibition house, also around the building, the effect was very typical of a Belgian nursery. Between the structures was an avenue of very fine pyramidal and standard bays in big tubs, arranged by M. H. Millet-Richard, Ledeberg. Between and below the bays were some big variegated phormiums from M. C. Ver Cauteren, Meirelbeke, and a set of remarkably handsome plants of the variegated Dracæna Doucetti, and D. indivisa Prince Albert, from M. Emile de Groot, Evergem, near Ghent. Dracæna lentiginosa, a purple green-leaved form of D. indivisa, was shown by M. Auguste Franck, Melle, near Ghent, close to the entrance; this was very fine.

The finest display of conifers, fifty plants, was made by the Horticultural Company of Calmpthont, who were awarded a special gold medal; they had handsome plants of Retinospora filifera, Thuiopsis dolobrata, Abies Pinsapo, Juniperus japonica, Cupressus Lawsonianum lutea, Abies concolor, A. canadensis, and A. excelsa aurea. M. Aug. Van Heden, Wetteren, near Ghent, gained second prize with another fine set of plants.

Very interesting and pretty was the alpine garden, arranged by M. Jules Buyssens, landscape gardener, of Brussels. Alpine shrubs occupied the upper positions, and water fell from stratified rocks into a small pool, and thence into other and lower pools, and finally down a little cascade to a miniature lake. Flowers were sparingly used, calthas and arabis predominating, though on a small outstanding bit of rockwork there were a few primulas, auriculas, violas, etc. M. Correvon, of the Jardin Alpin d'Acclimatation, Geneva, exhibited a small collection of alpines, such as the yellow Androsace Vitaliana, A. pyrenaica, Saxifraga Tombeauensis, the lovely little Gentiana verna, the vivid scarlet Silene virginica, and the quaint little Townsendia sericea, with blue daisy-like flowers, produced right down on the dwarf plants.

There were numerous greenhouses of varied construction, and quite an array of heating apparatus in the grounds, but of these we have not room to write. An extraordinary display was made by Messrs. Dutry-Colson, Rue des Champs, Ghent. This firm had mowing machines galore, water barrows, pumps, sprayers, ladders, tents, shelters, and garden seats, and an immense trophy-like exhibit of tools, arranged under a semi-circular open-fronted building. This was a really marvellous display, both for its extent and variety. Wirework, stakes, and the Foster and Pearson boilers, from Chilwell, Notts. (for which firm the Messrs. Dutry-Colson are agents) were included, and the whole was effective as well as interesting and educational.

Hardy Carpeting Plants.—Where the beds are vacant hardy carpeting plants, such as antennaria, cerastium, sedums, arenaria, etc., may now be planted, leaving proper spaces for the taller-growing subjects to be planted later on. By doing this work now the plants will have a good opportunity for becoming established early, and the work of bedding out later on will be lighter. —E. F. Hazelton.

MECONOPSIS WALLICHI.

The extent to which gardens have been enriched by the various members of the great natural order Papaveraceæ is not always apparent at a cursory glance. It embraces genera which are widely distributed upon mountain and plain, while the species are generally characterised by gorgeous and richly-coloured flowers. Few of the genera have been invested with so much interest in recent years as that of the meconopsis, which is chiefly owing to the newer species introduced from China. This interest has centred itself around the beautiful yellow-flowered M. integrifolia, and has reacted, to a certain degree, and thereby stimulated the cultivation of some of the older species. The only meconopsis indigenous to Britain is the little Welsh poppy, so named from its comparative local distribution; it is a pretty little plant, which soon makes itself at home, reproducing itself by seed in any, and often every, corner of the garden, but seemingly enjoying itself best when the roots are always cool and the foliage in full sun. To those acquainted only with this native plant it conveys but slight idea of the beauty of the exotic species which are found in the uplands of China and Thibet, while the good points of the genus is very clearly set forth in Meconopsis Wallichi, a species introduced from the Sikkim Himalayas as long ago as 1852, in which year it first flowered at Kew.

Meconopsis Wallichi is a plant of rare and striking beauty; from a rosette of delicate green leafage arises in summer a pyramidal spike bearing innumerable flower buds, which begin opening from the top downwards; the petals are close packed in the bud, which is densely clothed on the outside with felt-like hairs; the calyx splits at the apex in two halves, disclosing the crimpled petals, which, on expansion, are coloured a delightful shade of bright blue in the best forms, though a percentage of inferior forms are always present. The flowers are ephemeral in character, but they are produced in such rapid succession as enables the plants to retain their beauty for a considerable time; to this end they may be greatly assisted by removing all seed pods immediately the flowers fade.

Meconopsis Wallichi is a biennial, and the plants die after flowering. Seed ripens readily, and should be carefully preserved from the best-coloured flowers. It may either be sown immediately it is ripe or during the following spring. My practice is to sow seeds in pots of peaty soil during March, and place them in a late vinery to germinate. By the time the seedlings appear the vines furnish the necessary shade, and as they gain strength they are potted singly in three-inch pots, and returned to the same quarters, and grown in this position till June. Early in June the plants are hardened off and placed in a cool, shady position in the open air.

Where suitable ground is available the plants may be placed in their permanent positions about the end of June, though I prefer to shift them into five-inch or six-inch pots at this date, and plant out about the beginning of September, which allows sufficient time for them to become established in their positions before winter. Meconopsis Wallichi enjoys abundant moisture at all times, whether upon the [illegible] at the root, but in the last instance the soil must not become sour. It will grow in loam, but prefers a soil in which peat is freely used, while soils containing free lime are not likely to give good results. Planted among widely-set shrubs and lightly shaded overhead it m robust growth, while it presents a scorched and burnt-up appearance when grown in the open, or if anyway exposed to winds. It not infrequently happens that some plants fail to flower the second year, but they increase in size and beauty, and flower in the third or fourth year, when they are correspondingly finer. The appearance of these huge leaf tufts, with the elegant sub-divided leaves covered by orange-red hairs, upon which the collected raindrops stand reflecting the winter sun, enables them to claim a position of distinction as decorative plants quite apart from their beauty as flowering subjects.

Thomas Smith.

Walmsgate Gardens.

CAULIFLOWERS.

It is, I think, generally agreed that the cauliflower ranks amongst the most delicate and highly-valued of vegetables; especially is it esteemed during its early and late seasons, and considerable pains are usually taken in private gardens to secure a supply as early and as late as possible, relatively small and compact heads being preferred for the dining room. Fortunately, if the necessary means are available, and a good selection of varieties is made, there need be no great difficulty in securing a good supply of this vegetable, though it must at the same time be admitted that in order to do this a skilful system of management must be practised.

The first crop of the year can be obtained from seeds sown in the previous autumn, and as the condition of the locality as well the state of the weather during the plants' early stages of growth has a marked influence upon their size, their powers to withstand the trials of passing through the winter, and through the early spring without "buttoning," it is advisable to make two sowings of seeds, one about the middle of August, and the other at the end of this month; by neglecting to take this precaution, we have before now suffered disappointment.

The varieties that we grow for this purpose are Veitch's Early Forcing and Early London, and the latter affords succession to the former. The seeds should be thinly sown in the open upon rich, finely broken soil, which must be kept well watered if the weather is dry, and as soon as the plants are large enough they should be put into three-inch pots, sound loam and leaf-soil being employed as compost. During winter place the batch in cool pits, which should be freely ventilated in favourable weather so that the plants are kept perfectly hardy; but in order to prevent them receiving injury during spells of severe weather protect at such times with bracken or mats. In February a portion of the plants should be planted 15in. apart in rich soil placed in cool frames or pits, the remainder being shifted into pots 5in. in diameter, to be subsequently—about the end of March -planted out upon a rich, warm, and sheltered border 15in. apart in drills.

To succeed the autumn-sown plants, a sowing of Early Forcing, Early London, or similar early varieties should be made in a frame upon a bed of warm leaves, at the end of January or early in February. Prick the plants out 4in. or 5in. apart in a cool frame as soon as they are fit to handle, and keep them carefully supplied with tepid water. Should mildew appear, dust the plants with flowers of sulphur through a distributor. Further than having protection from frost, the plants should be grown as hardily as practicable, and with ordinary success they will be ready to plant out in May. Other successional crops raised upon similar lines should be sown early in March. At the end of March and the end of April, sowings of The Pearl may be made in open quarters, upon rich, well-pulverised soil. This variety is of excellent quality and is reliable for successional summer crops.

At the end of March, or early in April sowings should likewise be made for late use of such varieties as Early Giant, King of Cauliflowers, and Autumn Giant. The plants should be pricked out upon rich soil, and when large enough lifted with good balls of soil and planted with a trowel in open permanent quarters.

A deep loamy soil is the most suitable one for cauliflowers, and this should be trenched rather than dug, and in any case be heavily dressed with farmyard manure, and after the plants have become well rooted, periodical soakings with liquid manure are very beneficial, while at no time should the crops be allowed to suffer from want of water. While the plants are young the ground between them should be kept well hoed, and the plants be earthed before they become inconveniently large. Upon dry soils especially, mid-season crops may be benefited from being planted between the rows of peas that are wider apart than usually grown. Mulching with short litter or manure is also an excellent practice.

Slugs are very destructive to young plants in wet seasons and upon heavy soils; they may, however, be kept under by hand picking, or placing sawdust or ashes around each plant. T. Coomber.

The Hendre Gardens.

RHEUM PALMATUM AND ITS VARIETIES.

It is quite probable we should find far greater use made of the ornamental species of rheum in the best aspects of "free" garden landscape if the genus possessed no economic value in the garden rhubarb. There is in these days less observance of the line that defines the garden of pleasure and the garden of profit; the introduction of the pergola and the herbaceous border into the realm of the kitchen garden has been mainly responsible for this, and in several gardens recently planned there is a distinct trend towards blending the artistic and material values to the advantage of both.

In what I may term "free" garden landscape the rheums can play a very important part, and they have this advantage over many other plants so used: they are ornamental from the first, and they precede practically every other plant, ferulas excepted, in their season of effective display. Distinctly the best rheum to employ in garden landscape is the palmate species and its colour forms. These give us elegance of leafage and a greater rigidity of stem than any other, and if there is anything in the comparison to recommend them, they are less like the denizen of the kitchen garden than any other species I happen to know well.

In common with most strong herbs they enjoy a rich soil, the deep alluvium generally to be found at the margin of natural brooks and ponds is excellent for them, and in such material they attain to tropical luxuriance of flower and foliage that would be impossible to secure by any other means. Their quick growth is greatly in their favour. A tiny seedling will, in the course of two years' growth, develop into a plant twelve feet high and two yards across, and a grouping of several such plants so disposed that their individual outline is well maintained from a distant point of view is one of the best possible features of artistic landscape.

Wherever there is a sheltered recess among common trees and shrubs, a treeless area by waterside or a wild garden in its broadest sense, one can recommend rheums for their many stately and beautiful features. Typical R. palmatum is an old-time plant, but rarely met with in good condition. It forms a clump of handsome leafage two yards across, the petioles lengthy and more than usually strong for a rhubarb; the leaves are palmately cleft, green, with ruddy veining, and there are several minor lobes that add much to the elegant outline of the entire leaf cluster. The stems are greenish and minutely mottled red, the flowers are literally in rope-like culms, clustered in the free, bract-enclosed, verticils characteristic of the common rhubarb, and they persist for many weeks, gradually changing from the creamy-white tint of the perfect flower cluster to the pink tint of the seed cluster. The tall shafts, slender petioles, and elegantly lobed leafage convey no impression of the heavy, clubby character of the common rhubarb to my mind. One can, in fact, welcome them in the ideal wild garden where beauty of form and inflorescence, as distinct from that ornate and showy, should be a certificate for admission.

R. p. flore-roseo is a new form, whose flower clusters are pink-tinted. It is very beautiful in the early stages of its growth, the leafage being of a deep ruddy hue, and the flower stems are ruddy always. Another form that is probably a garden variation of flore-roseo is that named rubrifolium. This plant excels in its ruby-red colouring always. The first leaf is gloriously coloured and the last seed pod is crimson tinted. I have had a group of this plant for some years, and think it should find general favour. The leafage, stems, and flowers are those of palmatum, but ruddy tinted throughout. Var. tanghuticum is the Stag's-Horn-leaved rhubarb. It is simply R. palmatum with the leafage much depauperated, but in such a way that the plant gains in elegance thereby.

Seedlings vary a good deal in the colouring of their flowers, some are greenish, others cream-tinted, while many are pink. One or two seedlings may also show ruddy leaf colouring in the younger stages. The flower stems are comparatively slender, and are exceedingly tough, supporting verticils of erect-habited flower clusters that recall cimicifuga or astilbe. I have seen these rheums thriving in the coldest parts of Britain and in practically all kinds of soils. Provided they can have wind shelter and liberal feeding if the nature of the soil demands it, they will be found of great aid to the landscape gardener everywhere, for in them he will find plants that can take care of themselves, and which are ornamental throughout the growing season.

G. B. Mallett.

Camellias.—The best time to pot camellias is just after the young growths have ceased to lengthen and the new leaves are losing their softness, the roots being then active and full of vigour, so that they ramify the new soil at once without allowing time for it to get sour, as it sometimes will through an overdose of water when potting is done directly after flowering. Large old plants that occupy big pots or tubs rarely stand in need of being shifted, and the length of time that such can be successfully grown in a root-bound state, provided they are never allowed to go short of water, and get plenty of help from the manure tub, is astonishing.—T. B. Field.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

DECIDUOUS DENDROBIUMS.—The bulk of these dendrobiums having passed out of flower, and the new growths having advanced to the state when young roots make their appearance, any repotting necessary may be attended to without delay. It is not advisable to annually repot where there is ample root space and the compost in a good state of preservation, but the surface moss, which naturally dies after a season of prolonged drought, may be carefully removed and replaced with living moss. Any dead or decaying pseudo-bulbs should be cut away at this time, and the plants should be neatly staked and tied. Where repotting is necessary turn the plants carefully out of their pots or baskets, and after removing the decayed potting compost and cutting away all dead and useless back growths, careful examination should be made for scale or other insect pest that may be secreted about the base of the pseudo-bulbs. The pots selected should be just sufficiently large to contain the plants comfortably. Avoid too much material about the roots, drain to about two-thirds the depth of the receptacle, and fill in the remaining space with potting compost consisting of about equal proportions of fibrous peat and chopped sphagnum moss, pressing all moderately firm. The plants should at once be put under favourable conditions, and every encouragement given them to make satisfactory growth.

SECONDARY GROWTHS.—There is generally a difficulty with plants that are required for early flowering, in the fact that they make up their growth so early in the season that there is a great tendency on their part to produce secondary growths after completing the first growth in about the month of August. These secondary growths are undesirable, and every endeavour should be made at that season of the year to retard such growths by placing the plants under suitable conditions for the purpose. It is natural in the case of D. Wardianum to produce secondary growth, but the growth of this species starts again from its semi-dormant state into renewed vitality with the return of spring.

EVERGREEN DENDROBIUMS. — Although not so extensively grown in prominent orchid collections as at one time, the plants of this section are deserving of every consideration. D. thyrsiflorum, D. densiflorum, D. Farmeri, and the taller-growing kinds of the D. fimbriatum and D. Dalhouseanum sections are attractive, useful, and easily cultivated. They are found to succeed satisfactorily in the ordinary stove during the summer, with cooler and drier rooting conditions while in a dormant state. These are now producing their flower scapes, and as soon as the plants have passed out of flower any repotting necessary should be attended to. The compost recommended for the deciduous section is suitable also for these. The plants resent being disturbed, and repotting should only be done where more room is necessary or the compost is in a decayed state. Where plants of this section have been repotted, it is advisable to protect them by shading from strong sunlight until the new roots are established in the compost. The atmosphere should also be kept moist, and spraying the plants overhead once or twice a day will also assist in retaining the foliage and leaves in a plump state. Dendrobium Brymerianum does best in an intermediate house temperature, and is found to do satisfactorily under the same conditions as that usually afforded in the cattleya house.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

GENISTAS.—When flowering is over cut these back into shape, and fairly hard, better growths being made from firm wood than from the attenuated young shoots made under warmer conditions than the plants like. When the plants commence to break again into growth repot them, and grow them under cool conditions until it is safe to stand them outside in their summer quarters.

SOFT-WOODED PLANTS.—Fuchsias and many of the soft-wooded plants that have to be grown on quickly should never be allowed to become root-bound before they reach their final shift, so when the roots have reached the sides of the pots, and are in sufficient quantity to hold the soil together, they should be potted on.

BERRIED SOLANUMS should be well looked after just now, as the more bushy the plants can be made the better effect they will have, and it is well not to continue the stopping much longer, as the earlier this bushy habit is formed the better. Capsicums of the decorative type may now be sown. These are very ornamental plants in the late autumn and early winter. A very common mistake is to sow early in the year; the plants then come in at a time when they are not needed.

PLANTS AFTER FLOWERING.—Azaleas and rhododendrons should have the seed pods picked off directly the flowers have faded, taking care not to break away the young shoots which are forming immediately beneath the flower heads, as these will be the shoots to form the best buds for next year's flowering. Arums which have done flowering and are intended for early use next year may gradually have the water supply reduced, and be removed to a cold house for a time until they may be safely stood outdoors. Freesias should be stood on a shelf where they will be under the full influence of the sun, and no more water should be given to those which have lost their leaves from now until after they are again potted. —T. B. Field, Ashwellthorpe Gardens.

THE FLOWER GARDEN.

BAMBOOS may now be planted with success. There are few gardens where space and positions cannot be found for at least some of the best, even if a bamboo garden cannot be made. Avoid, if possible, bleak, exposed, or windy positions, those sheltered and partially shaded being the most conducive to their well-being. Enrich the soil with well-decayed manure and deeply dig in before planting; plant deep enough to just bury the rhizomes, and guard against unduly disturbing or damaging the roots. Make the soil nicely firm about the roots, and give a watering; a mulching of either leaf-soil or well-decayed manure will be helpful. Bamboos are especially attractive in the vicinity of water, on the fringe of woods, and clumps in dells, or as specimens in sheltered parts of the grounds.

HERBACEOUS BORDERS.—As growth advances these will need constant attention. Where rearranging or transplanting has been done during the past season it will generally be found that portions of roots of some things have been unintentionally left in the ground. These will now be making growth, and should be carefully removed before they have time to establish themselves. Watch also for slugs, and take steps to protect new or choice small things. The most efficient remedy is to catch and destroy them. The beautiful Phlox Laphami seems to have quite succumbed with us during the past winter. Where it does thrive it is, with its beautiful plumbago-like flowers, a most desirable acquisition; one's hopes and fears are now being realised as to what will survive during winter. Give support to all advancing growth as it needs it, to prevent damage by winds and storms. If severe frosts seem imminent give protection where possible to any of the most tender plants likely to be injured by it.

DAHLIAS.—If ground for these has not yet been dug and prepared, no time should be lost in preparing it, as it is better to prepare it now than when planting. Heavily manure and double dig the ground, manure will then be incorporated with the soil, and the dahlias when planted out, will at once start off with great vigour.

WINDOW BOXES.—Where these are used they may soon be attended to, especially on the southern or warmest side of houses, as the warmth of buildings will ward off frosts. The space for soil being necessarily very limited, a good compost should be used. The loam should be enriched with bonemeal or other lasting manure. If immediate effect is required plants suitable must be used; where a later display is wished for use marguerites, zonal, scented, and ivy-leaved pelargoniums, fuchsias, petunias, lobelias, heliotropes, tropæolums, alyssums, hydrangeas, stocks, Aloysia citriodora, Coleus Verschafelti, ageratum, etc.—E. F. Hazelton, Knowsley Gardens.

HARDY FRUITS.

STRAWBERRY PLANTS.—Plants which have been forced and been properly hardened may be planted on well-prepared land, deeply worked, with plenty of well-decayed manure thoroughly incorporated with the soil. If such plants are infested with red spider syringe the foliage with a suitable insecticide, and should their be any mildew visible dust with flowers of sulphur. Previous to turning them out of the pots give the plants a thorough soaking with clear water, so that every root is well moistened. If the ground has been prepared some time the soil will have settled and become somewhat firm; let the hoe be run through it, and rake the surface with a wooden rake; then set out the plants two feet apart, though some of the less robust varieties may be planted a trifle nearer in the rows. Shake the old soil away from the roots and plant firmly. The holes for the reception of the roots should be large enough to allow for spreading them out, and deep enough to allow for two or three inches of covering. afford sufficient water to soak the soil about the roots thoroughly, and after this slightly loosen the surface to prevent the soil from getting baked, and then mulch down with short manure. If these plants are kept free from weeds and runners during the summer months, they will develop into fine fruiting plants, and bear a heavy crop of fruit the following year. Any that are intended to fruit in autumn should be planted on a sunny border one foot apart, but none but good early varieties should be employed for autumn fruiting. To save labour in watering, etc., I prefer to get out forced plants as early as possible after they have been suitably hardened.

GRAFTING.—Any grafting which remains undone should be finished as early as possible; should the weather be dry, keep the butt ends of the scions in water until required. After placing them carefully and neatly on the stock bind moderately firm with wet, broad strips of raffia, and then clay them over. Those which have been done should be examined at intervals, and should the covering have cracked fill up the cracks with fresh puddle, and keep the wounds airtight. Late-grafted trees will be all the better if the clay is covered with moss, and, in dry weather, moistened daily. Pears, if espalier trained, may be worked on the upper side of the shortened back branches so long as the stocks are healthy and vigorous, but if old and practically worn out they should be replaced with fresh young trees at the proper time.

FRUIT PROSPECTS.—Although the fruit buds are plentiful, the weather, I fear, will prove too much for many things. Last Monday morning the gooseberries in flower and other fruit buds just opening, were covered with frozen snow, several inches of snow having fallen during the night. There has also been a long spell of cold, biting winds and frosty nights, and the foliage has a very yellow and sickly appearance. Nets have kept the peach blooms dry and free from snow, so that those who have taken some precautions will have no room for regret.—H. Markham, Wrotham Park Gardens.

PLANTING BEARDED IRISES.

The subject of the planting of the bearded irises, by which are meant those with the broad flag leaves, of which Iris germanica may be taken as the type, but which include quite a number of species and varieties, is often referred to in articles dealing with these flowers, but, despite this, there are few flowers with which more errors in planting are made than these noble irises, which have been aptly called the "Poor Man's Orchids." Despite the teachings of many writers, one finds these errors repeated day after day, even by good gardeners as well as by amateurs who are devoted lovers of flowers.

One thinks, therefore, that an article devoted to the subject of planting these flowers alone may not be without value for the assistance of those who see and admire good plants in bloom, and who either wish to begin to cultivate them, or have been baffled in attempting to flower these fine subjects. The time to plant is a consideration. Personally, I prefer about the month of August, and early in the month, but one has successfully shifted and broken up plants in spring, as soon after March as possible, choosing for the purpose rather showery weather.

This cannot always be managed, and it is wonderful how much drought these plants will stand without suffering. I moved all my collection one time late in April for the simple reason that my new garden was not ready till then, and planted them in the driest and almost the sunniest border I had. The succeeding summer was a very dry one, but the plants pulled through it splendidly, and flowered capitally the following season. Still, I should prefer early in August if I had my choice. Now this position was exactly one which many would have thought an improper one, seeing that it was both sunny and dry, and there are some who would have selected a shady or a moist position instead of this. Now that is exactly the error that so many fall into. People see the common British irises, I. pseudo-acorus, and I. fœtidissima flourishing in wet and moist places, and leap to the conclusion that that is the most suitable kind of place for the other flag irises. Others think they should do under the shade of trees, and in both cases they go wrong. There are a few exceptions, especially in dry parts where a little shade will not do much harm, and one sees the blue German iris flower fairly well under trees in the gardens on the Thames Embankment.

But many of the more southern irises are less accommodating in their ways, and want full sun and a somewhat dry position. They will, indeed, do much better on a roof or the top of a wall than in moisture or deep shade, and some lovely effects can be produced by planting these noble flowers in a few inches of soil on a wall or roof. I have grown them successfully on a roof with barely an inch of soil below them. In a very dry place a good addition of manure will induce more vigorous growth, but this is not necessary, and they can do with little or no manure.

In planting, the rhizomes, or root stocks, should not be buried, and I have frequently planted them with the soil just up to the base of these, the true roots, however, being in the soil, and the whole weighted with stones for a time until the roots had taken a firm hold. The larger plants may be broken up and divided when removing or when they grow too large, as they do not flower so freely when large as when they have only a few crowns. This may be done with a sharp knife, so as to injure the root stock as little as possible.

It must be remembered that these notes do not apply to the water-loving irises, such as the British species and Monnieri, Delavayi, and others, but only to the larger flag irises with crests or beards on the flowers. These are numerous enough to give a great variety of colour, and their success will render any garden much more delightful in the month of June and perhaps July, according to the climate, than if these irises were planted in unsuitable positions.

S. Arnott.

ACACIAS.

There are several species of acacia that are very useful for decorating both the conservatory and greenhouse, especially where the buildings are lofty and require tall plants. Some of the acacias may be grown as standards on stems of various heights. The species are by no means difficult to grow, and as they can be stood in the open after flowering, through the summer months, they make fine ornamental plants in tubs for decorating the terrace garden even when not in bloom.

Most of the acacias may be readily raised from seed, but there are some that grow well from suckers, which are produced in abundance from the roots. When raised from seed, and it is desired to make standards of them, the leading shoot should be allowed to grow the desired height before it is stopped, and all side shoots should be removed except about half-a-dozen or so at the top, and when these have grown about six inches long they should have their points taken out to induce them to make lateral growths, and this operation should be repeated until fine bushy heads are formed, after which the shoots ought to be allowed to extend, as it is along those made the previous year that the flowers are produced. Some species have deeply-cut, fern-like foliage, others have their leaves simply entire. The foliage of some is short and stubby, while in others it is long and narrow, making a fine contrast; even when the plants are not in bloom they are most interesting.

Acacia affinis is the best of the deeply-cut-leaved kinds, and flowers more freely than any others of its section, though A. lophantha and dealbata are useful where there is room to grow them; the former makes a fine sub-tropical plant for summer bedding. A. cordata, A. longifolia, and A. grandis are all worthy of a place; so also are A. coccinea and A. Drummondi. The old A. Armota is well known to our gardens, as it is one of our most common greenhouse plants. A. affinis grows freely enough from suckers, but it is difficult to get it true.

When plants have become old they may be pruned back to keep them within bounds; they will break freely from the old wood and make fine growths, which will bloom most profusely the following spring. The only pest that seems to trouble them is the scale, but when this is once allowed to get the upper hand it is difficult to get rid of. When the plants are grown in tubs, a light, rich, sandy soil should be used, and abundance of water will be needed during the summer when the weather is dry and the soil is filled with roots. The plants should be stood in a sunny position during the summer to enable them to ripen their wood, but they must be taken under cover before frost sets in, otherwise the young wood will, in all probability, be so injured that the flowers will not develop.

Buxted Park Gardens.

CARNATION NOTES.

Mr. Hayward writes so pleasantly on carnations that his notes are always interesting. On page 246 he refers to the variety Victory. I have not mentioned it in my list, previously given, for the one reason that I have not grown it, and the other because it has generally been given as synonymous with St. Louis. I have, however, seen Victory growing and in bloom, and from what I have seen of it I much prefer St. Louis as a flower. As I have seen Victory it is of different growth, and apparently not such a tall grower as the St. Louis we have.

Pure yellows seem difficult to obtain. I have three almost pure yellow seedlings on trial, and from some later seedlings it will be interesting to see if "like produces like" as regards colour. I have a promising seedling, rose-madder in colour, with other shades; it has a sound calyx and is clove scented; the stems are long and give a good 3in. bloom. Its growth is of similar habit to Harlowarden, a type which Mr. Hayward loves, judging from his high opinion of that crimson variety. Are there two varieties of Harlowarden? Our stock appears to be of two different styles of growth, although the flowers appear the same.

Britannia is disappointing in that it does not appear free enough in flowering. Several other varieties have not been so satisfactory this winter as in previous seasons. Among whites, White Perfection has given us the best blooms. Of Lady Bountiful it is seldom that we have a pure white bloom, as the flowers are nearly always marked with pink. Winsor comes a more pleasing shade of pink in mid-winter than in the spring.

More novelties are offered this season, and one grows a bit shy of buying before seeing them in bloom, yet it is not always possible to do that the first season they are offered; descriptions must be taken cum grano salis, if one is to avoid disappointment. Mr. Hayward mentions a seedling from Duchess of Fife and Miss Joliffe, and from his description of the colour I judge I have one very similar on trial, a seedling, but of different parentage. I have not the pedigree just to hand, but I think it was from a pink and a scarlet. It will be interesting to see what a batch of seedlings now coming into bud will produce in the way of colour. They are the result of the cross fertilisation of last year's seedlings.

T. H. Slade.

Lapagerias.—To succeed well with the lapagerias one must give them some attention, especially when grown in pots. One sometimes meets with good specimens in large pots, but it is only when planted out that they are seen to perfection. The one great difficulty in growing lapagerias in pots is that they make such abundance of thick fleshy roots. The points of these are very tender, they soon find their way to the bottoms of the pots, and almost invariably begin to die off as soon as they have become matted together in the drainage. When planted out they should have a good depth of soil and plenty of drainage. They succeed best in good fibrous peat and leaf-mould. A little cow manure which has been thoroughly dried and sweetened may be added, and the more space that can be given for the roots the better. Lapagerias, when established, take a great quantity of water; the surface of the border may often appear moist, when, if examined lower down where the roots are, it will be found to be dry. The border should have a good watering periodically, as there will be no danger of overwatering where good drainage is given. —T. B. Field.

SHREWSBURY GREAT FLORAL FETE.
Aug. 19th and 20th, 1908.
Cash Prizes are offered amounting to above £1,200, with Cups, Medals, etc.
Schedules may be had, post free, on application to the Hon. Secs.
Messrs. ADNITT and NAUNTON, Shrewsbury.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

APRIL 24.

The display on the above date was scarcely so interesting as usual, and not quite so large. Still, there was plenty to see and much to interest.

FLORAL COMMITTEE.

A wonderful blaze of zonal pelargoniums, made by Messrs. H. Cannell and Sons, Swanley, Kent, was greatly admired; of Caledonia, Blenheim, Ascott, Carmania, Saxonia, Arabic, and Mentmore there were very fine bunches. Messrs. William Bull and Sons, King's Road, Chelsea, submitted a small collection of stove foliage plants, and added a few examples of the bright blue-flowered Tradescantia fuscata.

Messrs. T. S. Ware, Lim., Feltham, had a distinct and interesting display, that consisted of blocks or masses of the lovely Aubrietia Pritchard's A1, A. Crimson King, A. Bridesmaid, A. Dr. Mules, A. græca, Primula Sieboldi, and Corydalis nobilis. The aubrietias were very fine. The Misses Hopkins, Mere Gardens, Shepperton, put up a quite attractive rock garden exhibit.

The white amaryllis shown by Mr. C. R. Fielder, gardener to Mrs. Burns, South Mymms Park, Hatfield, were very beautiful, and the new pure white variety, named Purity, was especially good, and worthy of the F.C.C. awarded; it has a very little green in the base, but otherwise there is no colour, and the variety has come true in 1906, 7, and 8. From Messrs. G. Jackman and Son, Woking, came an assortment of Primula Sieboldi varieties, and a selection of Japanese maples. Messrs. W. Cutbush and Son, Highgate, showed Indian azaleas, forced lilacs, wistarias, Choisya ternata, and other fine-flowering shrubs.

Messrs. H. B. May and Sons, Upper Edmonton, submitted a goodly exhibit of herbaceous calceolarias, petunias, pansies, clematises, dwarf and rambling roses, and Salvia Pride of Zurich. A pretty exhibit of violas was made in one corner of the hall by Messrs. Carter, Page, and Co., London Wall, E.C.

Perpetual carnations were beautifully shown by Mr. C. F. Waters, Balcomb, Sussex, and his vases of Britannia, Enchantress, White Perfection, Mrs. Lawson, and Elliott's Queen were especially good. In Messrs. G. Bunyard and Co.'s exhibit of cut daffodils and hardy flowers we were attracted by the double bluish primrose A. Dumollin, the monster double white daisies, double lilac, and the crimson Pompadour primroses, aubrietias, and the double Caltha palustris. The Chatham Island forget-me-not, Myosotidium nobile, was shown by Mr. James Douglas, Edenside, Great Bookham, but it was not in specially good form. A charming display of early flowers was made by Mr. Maurice Prichard, Christchurch, and here the new Aubrietia Lavender (A.M.) was very fine, while hardy cyclamens and the collection of double primroses were other attractions.

Saxifragas, aubrietias, and a few other alpines were shown by Mr. J. R. Box, West Wickham. Very beautiful were the big trusses of the lovely Rhododendron Aucklandi, R. A. hybrida, R. Dalhousiæ Victorianum, Cantua dependens, and the fragrant Posoqueria longifolia shown by Mr. Moody, gardener to F. Du Cane Godman, Esq., South Lodge, Horsham.

Roses were beautifully shown by Messrs. William Paul and Son, Waltham Cross, who had pillar plants of Kathleen, Tausendschon, Leuchtstern, etc., and dwarf plants of Albatross, Lyon Rose, Aennchen Muller, Madame Constant Soupert, and other good things. Messrs. Paul and Son, Cheshunt, sent the attractive Rosa sericea pteracantha, the fine Philadelphus Mer de Glace, and the pale Cytisus Daisy Hill. Messrs. Frank Cant and Co., Braiswick, Colchester, showed fine pillar plants of Hiawatha, Minnehaha, Dorothy Perkins, and other roses.

Mr. R. L. Russell, Richmond, had a very handsome group of mollis and Ghent azaleas, clematises, lilacs, cytisuses, and other lovely flowering shrubs. Azalea mollis formed the foundation of a brilliant display of forced flowering shrubs, put up well by Messrs. R. and G. Cuthbert, Southgate. Over these were standard azaleas, lilacs, wistarias, and Prunus triloba. The Misses E. and M. Kipping, Hutton, Essex; the Guildford Hardy Plant Nursery Company, and Messrs. J. Peed and Son, Norwood, all exhibited alpines in variety, and the latter firm had also some very beautiful gloxinias.

A very bright and attractive exhibit of violas was made by Messrs. Dobbie and Co., Rothesay, but, unfortunately, we have not room to detail the varieties; of equal value and effect were the splendid polyanthuses in varied and brilliant colours, the yellow, white, and crimson varieties being wonderfully fine. A bold, mound-like group of well-grown florist's and stellate cinerarias was put up by Messrs. James Carter and Co., High Holborn, right opposite the entrance; this was a fine display of a fine strain.

Some wondrously beautiful rose blooms of such varieties as Frau Karl Druschki, Richmond, Joseph Lowe, Mdme. Abel Chatenay, Catherine Mermet, Ulrich Brunner, Caroline Testout, and Mrs. Sharman Crawford were set up by Mr. George Mount, Canterbury. A bold and beautiful group of carnations and liliums was arranged by Mr. W. H. Page, Tangley Nursery, Hampton; his flowers of Mrs. T. W. Lawson, Governor Roosevelt, My Maryland, Winsor, Rose Pink Enchantress, White Lawson, and Nelson Fisher were very fine. Echium callithyrsum, with a few big spikes of blue flowers, was shown by Mrs. Bridget Talbot, of Berkhamsted.

Some very fine perpetual carnations were shown by Messrs. Cutbush and Son, Highgate, whose best varieties were Robert Craig, Victory, and Enchantress, with these were the new and beautiful Peach Blossom spiræa, the new and brilliant Coleus cordelia, and Rhododendron Smithi aureum. Messrs. Hugh Low and Co., Enfield, had Metrosideros floribundus in quantity, and its bottle-brush spikes were greatly admired. Messrs. J. Veitch and Sons, Chelsea, set up the interesting Clianthus puniceus magnificus, blue hydrangeas, the orange-coloured Primula Cockburniana, cinerarias in variety, and the brilliant Azalea Vuylstekeana. Daffodils, saxifragas, tulips, primulas, aubrietias, and other popular early spring flowers were sent by Messrs. G. and A. Clarke, Dover.

ORCHID COMMITTEE.

Extraordinarily beautiful were the big, grandly flowered plants of Oncidium Marshallianum exhibited by Mr. Davis, gardener to J. Gurney Fowler, Esq., Glebelands, South Woodford. The plants were on rafts, and we have never seen finer ones or better spikes. A cultural commendation was deservedly awarded. Messrs. Hugh Low and Co., Bush Hill Park, Enfield, sent a very pretty group of the little white flowered Dendrobium barbatulum. Mr. Bevington, Murle Wood, Sevenoaks, showed Aerides Vandarum Kirke's variety (A.M.). Messrs. Heath and Son, Cheltenham, sent a few orchids, and Mr. De Barri Crawshay sent the richly blotched Odontoglossum Queen of the Earth (F.C.C.).

In Messrs. Cypher and Son's group of orchids the most conspicuous plants were Miltonia vexillaria, Oncidium intermedia nivea, L.-c. Dominiana magnifica, Brasso-cattleya, Digbyana-Mossiæ, and Oncidium concolor. Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Dorking, showed the curious Odontoglossum platyphyllum superbum (A.M.), Cirrhopetalum Wendlandianum, and the quaint Megaclinium cocoinum. Messrs. Armstrong and Brown, Tunbridge Wells, showed odontoglossums, masdevallias, a few dendrobiums, Lælia majalis, and Lælio-cattleya Mercia.

Mr. H. Little, Baronshalt, Twickenham, submitted a collection of orchids that contained varieties of Lælia purpurata, Cattleya Mendeli, odontoglossums, and cypripediums.

DAFFODIL COMMITTEE.

Messrs. Cartwright and Goodwin, Blakebrook, Kidderminster, contributed a charming exhibit of daffodils, the admirable flowers being thoroughly well shown. A few of the best were Circlet, White Slave, Juliet, Northern Light, Evangeline, Armeline, Rising Sun, Water Nymph, Seagull, Homespun, Mrs. Robert Sydenham, Weardale Perfection, Ethereal (a pure white flat-crowned variety from Hon. Mrs. Barton and Cassandra), and Glory of Leiden. Some choice daffodils and good polyanthuses were set up by Mr. Alex. Wilson, East Keal Manor, Wisbech, whose best daffodils were Cuckoo, Horace Grayling, Bullfinch, Green-eye, and Lady Margaret Boscawen.

Daffodils were extensively displayed by Messrs. Barr and Sons, Covent Garden, and among the new and seedling varieties shown by this firm there were many very beautiful things, notably Blazing Star, Royalist, Catriona, Honeydrop, Radiant, Stay Sail, Buttercup, Furnace—with a vivid orange cup—Iris, Citronea, Chancellor, and Pedestal. This was a most interesting exhibit. Daffodils were freely shown by Messrs. James Veitch and Sons, Chelsea, and the leading varieties staged over a groundwork of ferns were Goldfinch, Culinan, Lord Kelvin, Maximus, Victoria, Pres. Wentholt, Madame Plemp, and H. J. Veitch. With the daffodils were a few beautifully flowered plants of Veitch's grandiflora strain of schizanthuses.

The largest display of daffodils was an excellent one from Messrs. R. H. Bath, Lim., Wisbech, who had a fine lot of clean flowers well set up. A few of the finest varieties were Madame de Graaff, White Lady, Argent, Cornelia, Weardale Perfection, Lady Margaret Boscawen, Brilliancy, Madame Plemp, Mrs. J. B. M. Camm, and Glory of Leiden. This firm had also a fine bronze pansy, with immense flowers, on view. Mr. R. Sydenham, Tenby Street, Birmingham, showed daffodils, tulips, and lily of the valley growing in moss fibre without drainage. Some charming early tulips, cut flowers, were submitted by Messrs. R. and G. Cuthbert, Southgate, whose best blooms were of Gesneriana lutea, Gala Beauty, Flava, The Fawn, Orange King, and Scylla.

Messrs. Pope and Son, Kings Norton, Birmingham, showed a big lot of daffodils that contained a large number of seedlings, including several beautiful trumpet varieties. There were also good bunches of Glory of Leiden, Weardale Perfection, Lady M. Boscawen, Gloria Mundi, Olympus, Andromeus, Madame de Graaff, Mrs. Galton, Grandee, etc. Messrs. William Bull and Sons, Chelsea, also exhibited daffodils. Messrs. R. Wallace and Co., Colchester, had an exhibit that consisted largely of daffodils and tulips, but contained the fine Caltha polypetala, Daphne cneorum, Gerbera Jamesoni, and fritillarias. Mrs. Backhouse, Sutton Court, Hereford, showed a few choice daffodils, including several new ones.

FRUIT AND VEGETABLE COMMITTEE.

Thoroughly well preserved apples and a few pears were exhibited by Messrs. James Veitch and Sons, Chelsea; conspicuously good among the apples were the dishes of Bramley's Seedling, Gloria Mundi, Winter Peach, Lane's Prince Albert, Melon Apple, Claygate Pearmain, Duke of Beaufort, Annie Elizabeth, King of Tomkin's County, Calville des Femmes, Cox's Orange Pippin, Lord Derby, Newton Wonder, and Beauty of Kent. This firm had also some excellent lettuces, both Cos and cabbage, all grown under the French system; the cabbage varieties were Early Frame and Passion, and the Cos varieties Early Market and Early Green forcing, and all the plants were in splendid condition.

Some very fine strawberries, Royal Sovereign, were sent by Mr. A. R. Allan, gardener to Lord Hillingdon, Hillingdon Court, Uxbridge; the fruits were especially good.

CERTIFICATES AND AWARDS.

First Class Certificates.—Odontoglossum crispum Queen of the Earth, from Mr. de Barri Crawshay, Rosefield, Sevenoaks; Hippeastrum Purity, from Mr. C. R. Fielder, gardener to Mrs. Burns, South Mymms Park, Hatfield.

Award of Merit.—To Odontoglossum platychielum superbum, from Sir Trevor Lawrence, Bart., Dorking; Cirrhopetalum Wardlandianum, from Sir Trevor Lawrence, Bart.; Odontoglossum nævium, from Messrs. Armstrong and Brown, Tunbridge Wells; Aerides Vandarum Kirke's var., from Mrs. Bevington, Sevenoaks; Aubrietia Lavender, from Mr. M. Prichard, Christchurch; Auricula, Phyllis, from Mr. James Douglas,Great Bookham, Surrey.

MEDALS.

Silver-gilt Flora.—Messrs. Cutbush and Son, Highgate; Mr. G. Mount, Canterbury; Messrs. W. Paul and Son, Waltham Cross; Mr. L. R. Russell, Richmond; Messrs. Barr and Sons, Covent Garden.

Silver-gilt Banksian.—Messrs. Cartwright and Goodwin, Kidderminster; Messrs. R. H. Bath, Lim., Wisbech.

Silver Flora.—H. Little, Esq., Baronshalt, Twickenham; Mr. Davis, gardener to J. Gurney Fowler, Esq., Glebelands, South Woodford; Messrs. James Carter and Co., High Holborn; Messrs. R. and G. Cuthbert, Southgate; Mr. W. H. Page, Hampton; Messrs. H. B. May and Sons, Edmonton; Messrs. James Veitch and Sons, Chelsea; Messrs. Pope and Son, Kings Norton.

Silver Banksian.—Messrs. Cypher and Sons, Cheltenham; Messrs. H. Low and Co. (one for orchids and one for other plants); Messrs. Heath and Son, Cheltenham; Messrs. Armstrong and Brown, Tunbridge Wells; The Misses Hopkins, Shepperton; Messrs. F. Cant and Co., Braiswick, Colchester; Messrs. Carter, Page, and Co., London Wall; Messrs. Dobbie and Co., Rothesay; Messrs. J. Peed and Son, West Norwood; Mr. M. Prichard, Christchurch; Mr. G. Reuthe, Keston, Kent; Mr. C. F. Waters, Balcombe, Sussex; Messrs. R. Wallace and Co., Colchester; Messrs. R. and G. Cuthbert, Southgate (tulips).

SCIENTIFIC COMMITTEE.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair); Messrs. G. S. Saunders, W. Hales, E. M. Holmes, A. Worsley, W. C. Worsdell, G. Massee, J. T. Bennett-Poë, W. Cuthbertson, and F. J. Chittenden (secretary).

FUNNEL-SHAPED OUTGROWTH IN IVY.—Mr. W. C. Worsdell showed a leaf of ivy having a funnel-shaped growth proceeding from near the base, similar to that often seen in cabbages, but in this case it grew from the lower surface.

DOUBLE-SPATHED RICHARDIA. — G. Siggs, Esq., F.R.H.S., of Streatham Hill, sent an inflorescence of Richardia ethiopica with a second full-sized leaf proceeding from the flowering stem, about eight inches below the normal spathe, of a white colour, except at the tip. The phenomenon is common, but was particularly well marked in this specimen.

PROPAGATION OF DROSERA. — Mr. Hales showed plants of Drosera hilaris raised from root cuttings put in about five weeks ago. The plants had each developed a number of leaves.

GALL-LIKE GROWTHS OF LARCH.—Mr. Massee reported that the gall-like growths on the larch shoot shown by Mr. Holmes at a previous meeting were really the scales of a female cone, which had been separated from one another by the growth of internodes. They had apparently been early attacked by Thrips abietis. Seeds and seed scales were both to be found in their axils.

SEEDLING ELM.—Mr. Chittenden showed a seedling of Ulmus glabra from Terling, where they had occurred in abundance last season (see "Kew Bulletin," 10, 1907, p. 404). This elm is abundant in many parts of Essex, but only once before had he found a seedling, and that in his garden at Chelmsford in 1903. U. campestris, of which this is probably a form, is not known to seed in England, unless the seedlings recorded from the King's College "Backs" should prove to be really those of that tree.

DISEASED PLANTS, ETC. — Several diseased plants and insect pests were received and dealt with.

National Auricula and Primula Society.

SOUTHERN SECTION.

The thirty-second annual show of this society was held in the Royal Horticultural Hall, Vincent Square, on Tuesday last, in conjunction with the ordinary fortnightly meeting of the Royal Horticultural Society. It certainly was not a large show, but the wonder is there was a show at all, considering the weather these enthusiastic fanciers have had to assist or otherwise help them. However, Mr. James Douglas seemed to have timed his plants to a day, without any "hurrying up" at the last, which was all too apparent in some of the exhibits. Although the exhibits were less in number, the quality in the leading classes was quite up to the average. Unfortunately all the classes were not filled. Class 1 was for twenty-four plants, not less than twelve varieties. Five competitors faced the judges, but Mr. James Douglas proved an easy victor with a very even display. The varieties employed were Favourite, Marmion, Queen of Spain, Mrs. Henwood, Acme, Harrison Weir, Eucharis, Abercrombie, Vanguard, Prince Charming, Rachael Headley, Olympus, Othello, Abbe Liszt, George Lightbody, Greylag, Shirley Hibberd, and A. Baker.

The Rev. F. D. Horner, Burton-in-Lonsdale, was second, having good specimens of Black Pearl, Pink Pearl, Azure, and Minnie Horner. Mr. W. M. Shipman, Cleveley, Altrincham, Lancs., was third; while Messrs. Phillips and Taylor, Bracknell, were fourth.

For twelve varieties, distinct, there was a similar number of entrants, with Mr. James Douglas again leading easily. His varieties were Mikado, Marmion, Richard Headley, Charm, Eucharis, Favourite, Amy Robsart, Mrs. Phillips, Abbe Liszt, Harrison Weir, and George Lightbody; truly a strong team.

Mr. W. Smith, Bishops Stortford, was a capital second, and is to be congratulated in appearing so strongly. The best plants were Seaman, Mrs. Osmond, Stately, and Mikado. Mr. W. M. Shipman was third, and the Rev. F. D. Horner brought up the rear.

In a smaller class, for six distinct varieties, exhibited a falling away in competition, the first position falling to Mr. J. Bennett-Poe, Ashley Place, who staged six good plants comprising Rev. F. D. Horner, Miss Barnett(Miss Prim, Mrs. Henwood,Rachael, and George Lightbody.

Mr. Martin R. Smith, Hayes, Kent, followed with well-developed plants of Mabel, Miss Prim, and Gerald. The third prize fell to Mr. F. W. Price, Beckenham, for a creditable exhibit.

For four distinct varieties Mr. J. Bennett-Poe led off with Abbe Liszt, Acme, Mrs. Phillips, and Abraham Baker.

Mr. F. W. Price came next with good specimens of Dr. Hardy and Ruby, while Mr. M. R. Smith had to be content with third prize.

The classes for single plants of each section did not bring out the competition one is accustomed to see at this show. In the green-edged varieties Mr. James Douglas won first and second prizes with Abbe Liszt, while Mr. J. Bennett-Poe was third with Dr. Hardy.

The grey-edged varieties were not so well represented. Mr. J. Bennett-Poe came out first with a good specimen of George Lightbody, Mr. James Douglas winning second with Richard Headley, while Mr. Shipman was third with George Lightbody. In the white-edged varieties Mr. James Douglas was awarded first place with Conservative, Mr. J. Bennett-Poe being second with Vesta, and Mr. Charles Turner, Slough, third, with Acme.

The competition in the self section was decidedly better, Mr. James Douglas taking up his usual position in front for both first and second places with Harrison Weir and Victor in the order named.

Class 9 was for seedlings not exhibited before, the competition being confined to amateurs only, Mr. Martin R. Smith winning the green-edged section with The Sirdar, Mr. W. Smith taking second with an unnamed seedling. Surely this was an oversight on the part of the exhibiter.

In the grey-edged section Mr. W. Smith was first with Stately, a very promising variety; the Rev. F. D. Horner followed with Graylis.

For selfs the same exhibitor won first prize with Dulcie, while Mr. W. Smith was second with Sunrise.

The novices were conspicuous by their absence in the class allotted to them.

The alpine classes were, or appeared to be, most popular, not only with the exhibitors, but with the general public. In the class for twenty-four plants, not less than twelve varieties, there was a good entry, and competition keen, but there was no stopping Mr. James Douglas, who again scored premier position with a charming exhibit. The varieties employed were Jacoby, Claud Halcro, Argus, Olivia, Milkmaid, Rover, Richness, Mrs. James Douglas, General Buller, Thetis, Ettrick, Martin Smith, Flora McIvor, The Czar, Mrs. Martham, Teviotdale, Rosy Morn, and Lady of the Lake.

Messrs. Phillips and Taylor, Bracknell, came in for second prize, having good examples of Charmer, Orion, Argus, Mars, Her Grace, and Mrs. Gorton; while Mr. Martin R. Smith made a capital third.

In the smaller class for twelve distinct varieties there were five competitors. Mr. James Douglas again leading with a beautiful collection. The varieties were Argus, Thetis, Jacoby, Janet, Mrs. Markham, J. F. Kew, Bayonne, Rosy Morn, Teviotdale, Ettrick, Mrs. James Douglas, and Duke of York.

Mr. M. R. Smith came next with nice plants of Argus, Duke of York, Dainty, Lady, and Cherub. The third prize was awarded Messrs. Phillips and Taylor.

Class 14 was for smaller exhibitors, but only four contestants staged. The first prize being awarded Mr. J. J. Keen, Southampton, who staged Hampton, Horick, and Argus as his best plants. Mr. F. W. Price came second with good specimens of Argus, Urania, and Duke of York. Mr. J. Bennett-Poë was third. In the smaller class for four plants, Mr. J. J. Keen was easily first with Argus, Shirley, and Herod. Messrs. F. W. Price and T. Barefoot followed in the order named.

For a single alpine with a gold centre, the Rev. H. A. Soanes secured the first prize with Duke of York in a keen competition. Mr. J. Bennett-Poë was second, staging the same variety, while Mr. Charles Turner was third with General Buller.

For six alpine seedlings there were three exhibits, Mr. Martin R. Smith being placed first with Winsome, Madame Patti, and Ophelia. Mr. R. Staward, Panshanger, Hertford, was second.

The class for twelve fancy varieties, in not less than six sorts, secured three entries, Mr. James Douglas being well to the fore with a splendid collection. The varieties employed were Moonstone, Quakeress, Saffron, Rolls Red, Orient, Sybil, Innocence, Sunset, Moonbeam, and Old Gold. Mr. Martin R. Smith came next, with nice plants of Buttercup, Lucretia, Old Gold, and J. Hannaford; while Mr. Charles Turner was third.

The classes for primula species were poorly represented in all the classes, the only exhibitor being Mr. Martin R. Smith, who staged splendidly in each case.

For twelve species he staged excellent pans of P. pubescens alba, P. rosea, P. decora, P. Veitchi, P. Sieboldi, Ruby Queen, and P. viscosa. In each case many were unnamed, which was a great disappointment to the public, while the labels of others were quite hidden. This important item surely should not be overlooked in future.

The smaller class was not represented. For a group of any species or varieties of primulas or auriculas in a box or basket, not to exceed twelve superficial feet, Mr. Martin R. Smith made a really fine display, and caught the eye and admiration of everyone. The arrangement was excellent, every plant being clearly displayed. The varieties of Primula Sieboldi and P. japonica occupied the back, while P. denticulata, P. Cashmeriana, P. Cockburniana, among others, were conspicuous. The alpine auriculas were bright, and had a most pleasing effect.

The class for a group of primroses and polyanthus plants, arranged for effect, produced two competitors. Mr. S. Mortimer, Farnham, led with a splendid strain of well-grown plants, the trusses were large and the colours exceedingly bright. Mr. J. Crook, Camberley, was second with a good exhibit containing some novel colours.

The premier show variety was George Lightbody, staged by Mr. James Douglas.

The same exhibitor was also the happy possessor of the best alpine, appropriately with Mrs. James Douglas.

The Midland Daffodil Society.

This society held its annual show at Edgbaston Botanical Gardens on April 23 and 24 literally in a snowstorm, for on the opening day it snowed from early morning till late at night. This, as might be expected, had a disastrous result on the attendance, and, although there was an improvement in the weather on the Friday, there will be a serious fall in the total gate money. The show was opened by the Dowager Duchess of Sutherland, who briefly alluded to the humanising influence of floriculture. Gardening, she said, was one of the most fascinating things in the world. Advantage was taken of the occasion to make three interesting presentations, one to Mr. Robert Sydenham of a beautiful address in album form, in token of the work he has done as founder and treasurer and beneficent supporter of the society; a second to Mrs. Robert Sydenham, of silver candelabra, who was appropriately joined with her husband as hostess of the enjoyable dinners on the occasion of the Birmingham gathering; and a third to Mr. Herbert Smith, the courteous and indefatigable honorary secretary, of a silver tea service and purse, as an acknowledgment of services so quietly performed, yet so far reaching in their scope and effect, that the Rev. G. H. Engleheart, who made all the presentations on behalf of the subscribers, referred to him in his own felicitous and facetious manner as "the universal provider."

As regards the flowers, the exhibition was one of surpassing beauty and merit, notwithstanding the cold, trying winds of this wintry spring, and the extra lateness of the season. There were gaps, as might be expected, in the ranks of the Northern exhibitors, but on the other hand the South was well represented, and Mr. C. Dawson, of Penzance, for the first time in the history of the show, was able to bring one of the choice exhibits we know so well at Vincent Square. It is to be regretted that we had none of Mr. W. F. M. Copeland's fiery doubles, or Messrs. Pearson and Sons' new Leedsis and White Magnis, but another year the wheel of fortune may turn, and they may be, so to speak, the winning numbers. It is difficult to know how to convey to readers an adequate idea of the show in the space in which a report must necessarily be confined. There were so many new flowers of the highest quality that merit a more than passing notice. Mrs. Backhouse, of Hereford, Mr. Engleheart, and Mr. Dawson had stands of entirely new varieties. There were eight exhibits for the Bourne Cup class of "twelve new seedlings to be raised by the exhibitor," and one cannot say how many in the Magni, Medio, and Parvi classes, nor how many for the Cartwright Cup, and the other classes for varieties not in commerce, to say nothing of the choice new things dotted here and there in the beautiful trade exhibits of more ordinary varieties. The Midland schedule is, roughly speaking, divided into three parts—(1) Daffodil classes, open to all; (2) classes confined to amateurs; (3) classes for novices; (4) classes for seedlings and new varieties; (5) classes for other flowers and grown in pots or ornamentally arranged. In section one, the first prize in the collection of fifty varieties was won by Mr. E. M. Crosfield with a splendid lot of practically new varieties, many being seedlings of his own, Mrs E. Crosfield, Countess of Stamford, Lolah, and Uncle Robert among White Magnis, and Radiant, Firebrand, and Coeur-de-Lion among the red cups, were of much merit; Mr. Herbert Chapman, of Rye, was second, he had a nice fresh lot of the best standard varieties. In the other classes Messrs. Cartwright and Goodwin, and Messrs. Pope and Sons divided the prizes, with the exception of that for Poeticus, which was won by Mr. Chapman.

Among the amateurs the names of the Rev. T. Buncombe, Mr. W. A. Watts, Mr. H. B. Young, Rev. G. P. Haydon, and Mr. W. H. Parton were most frequently top or thereabouts. The Rev. G. P. Haydon's white and bicolor Magnis were particularly good, and deserve special notice, so, too, does Mr. Buncombe's setting up of the twenty-five collection. The novices' prizes nearly all went to Mr. N. V. Lower, who hails from Presteign. His blooms generally were small, but they were delightfully fresh. The chief interest of the show to "daffodil people" obviously centered in the seedling and new variety classes. The Bourne Daffodil Cup was offered for twelve new seedlings raised by the exhibitor. Ninety-six blooms were staged in competition, that is, there were eight entries. So close and keen was the tug of war that it took all but an hour for the judges to be able to say that Mr. P. D. Williams had won the first prize from Mr. E. M. Crosfield. The Cartwright Challenge Cup (given by that well-tried friend and supporter of the society, Mr. R. C. Cartwright, of King's Norton) was offered for new varieties that have not been in commerce four years. Here Mr. E. M. Crosfield was first, and the Rev. G. P. Haydon, of Canterbury, second. Mr. I. Batson, of Beasworthy, was first in the novice seedling class.

The last section calls for no special comment, beyond the fine examples of pot culture evidence in Mr. W. H. Parton's daffodils and tulips, and the somewhat mediocre display in decorative classes.

The numerous trade exhibits contributed greatly to the size and beauty of the show. The gold medal of the society was awarded to Messrs. Barr and Sons for an admirably arranged bank of daffodils, which included many new white trumpets and red cups. Corallina and Salmonetta were distinctive because of their pink-toned coronas. Miss Currey (silver-gilt medal) had Beacon, Vivid, Firebrand, and Scarletta among other red Medios; Mrs. R. Sydenham, Avalanche, and The Banshee among other white trumpets, and Epic, a grand, free-flowering Poeticus. The large silver medal was awarded to Sir Jocelyn Gore-Booth, Bart.; Mr. Charles Dawson, of Penzance; and Messrs. Hogg and Robertson, of Dublin; and silver medals to Mr. Wilson, Mr. Engleheart, Messrs. Wallace and Ware, and Messrs. R. H. Bath.

In trade exhibits other than daffodils, the following awards were made: Silver-gilt medal to Messrs. Gunn and Sons, of Olton, for beautifully arranged rock work; the large silver, to Messrs. Baker, of Wolverhampton, for a rock exhibit which contained several new or rare plants, such as Primula Cockburniana, Mertensia primuloides, and Saxifraga Fergusoni; to Mr. S. Mortimer, for American carnations; to Messrs. Hewitt and Co., for forced shrubs; to Mr. V. Slade, of Taunton, for zonal pelargoniums; and to Messrs. Sutton and Sons for a magnificent bank of Cineraria stellata of all shades of colour. The silver medal was given to the Misses Hopkins for a prettily arranged stand of alpines and different varieties of primulas; and to Mr. R. Sydenham for a collection of bulbs grown in fibre, and cut flowers.

We shall publish the notes on the new daffodils by the Rev. J. Jacob in our next issue.

Huntingdonshire Daffodil Society.

The third exhibition of the Huntingdonshire Daffodil Society was, we are pleased to state, most successful. A fine display was provided by the trade and amateur exhibitors. Fine stands were well shown by Messrs. J. E. Perkins, Barr and Sons, R. H. Bath, Lim., Sir Jocelyn Gore-Booth, Lord Sandwich, Messrs. Laxtons, Messrs. W. and J. Brown, Miss Currey, Lismore, Ireland and Messrs. Laxton. The quality of the amateurs' flowers was up to a very good standard considering the bitter weather experienced this spring. Among other successful exhibitors were Lady Lilford (winner of Messrs. Barr's Cup for the second time), A. R. Darlington, Esq., Mrs. Nowell Usticke, Miss L. L. Linton, and Lady De Ramsey.

R.G.O.F. AND YORKSHIRE GARDENERS.

This fund, and the special appeal which is being made at the present time on its behalf in connection with the coming of age festival on May 12, should, I think, be of especial interest to Yorkshire horticulturists, seeing that the inception of the fund was mainly due to a Yorkshire gardener, Mr. Clayton, late of Grimston Park, Tadcaster. But probably many, like myself, have hitherto never given the matter any very serious thought, or it may be that we are sometimes apt to think that such institutions, having their headquarters so far away as London, have not much claim upon us here in the north; a glance, however, through the annual report certainly shows that this is not the case.

I find that there are in Yorkshire two children in receipt of the benefits of the fund, viz., £13 per annum each, or £26 in all, but the whole of the subscriptions from Yorkshire are very much below this amount, and the proportion of it which comes from Yorkshire gardeners is very small indeed. I note that one town in the Midlands (not a large one) sends half as much as the whole of Yorkshire.

An appeal made during the past week to three small gatherings of gardeners in this locality had an immediate result of nearly fifty shillings being subscribed to the popular shilling collection, and several volunteered to take collecting sheets for their respective districts, so I hope this amount will be considerably increased before the coming of age festival on May 12.
